

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

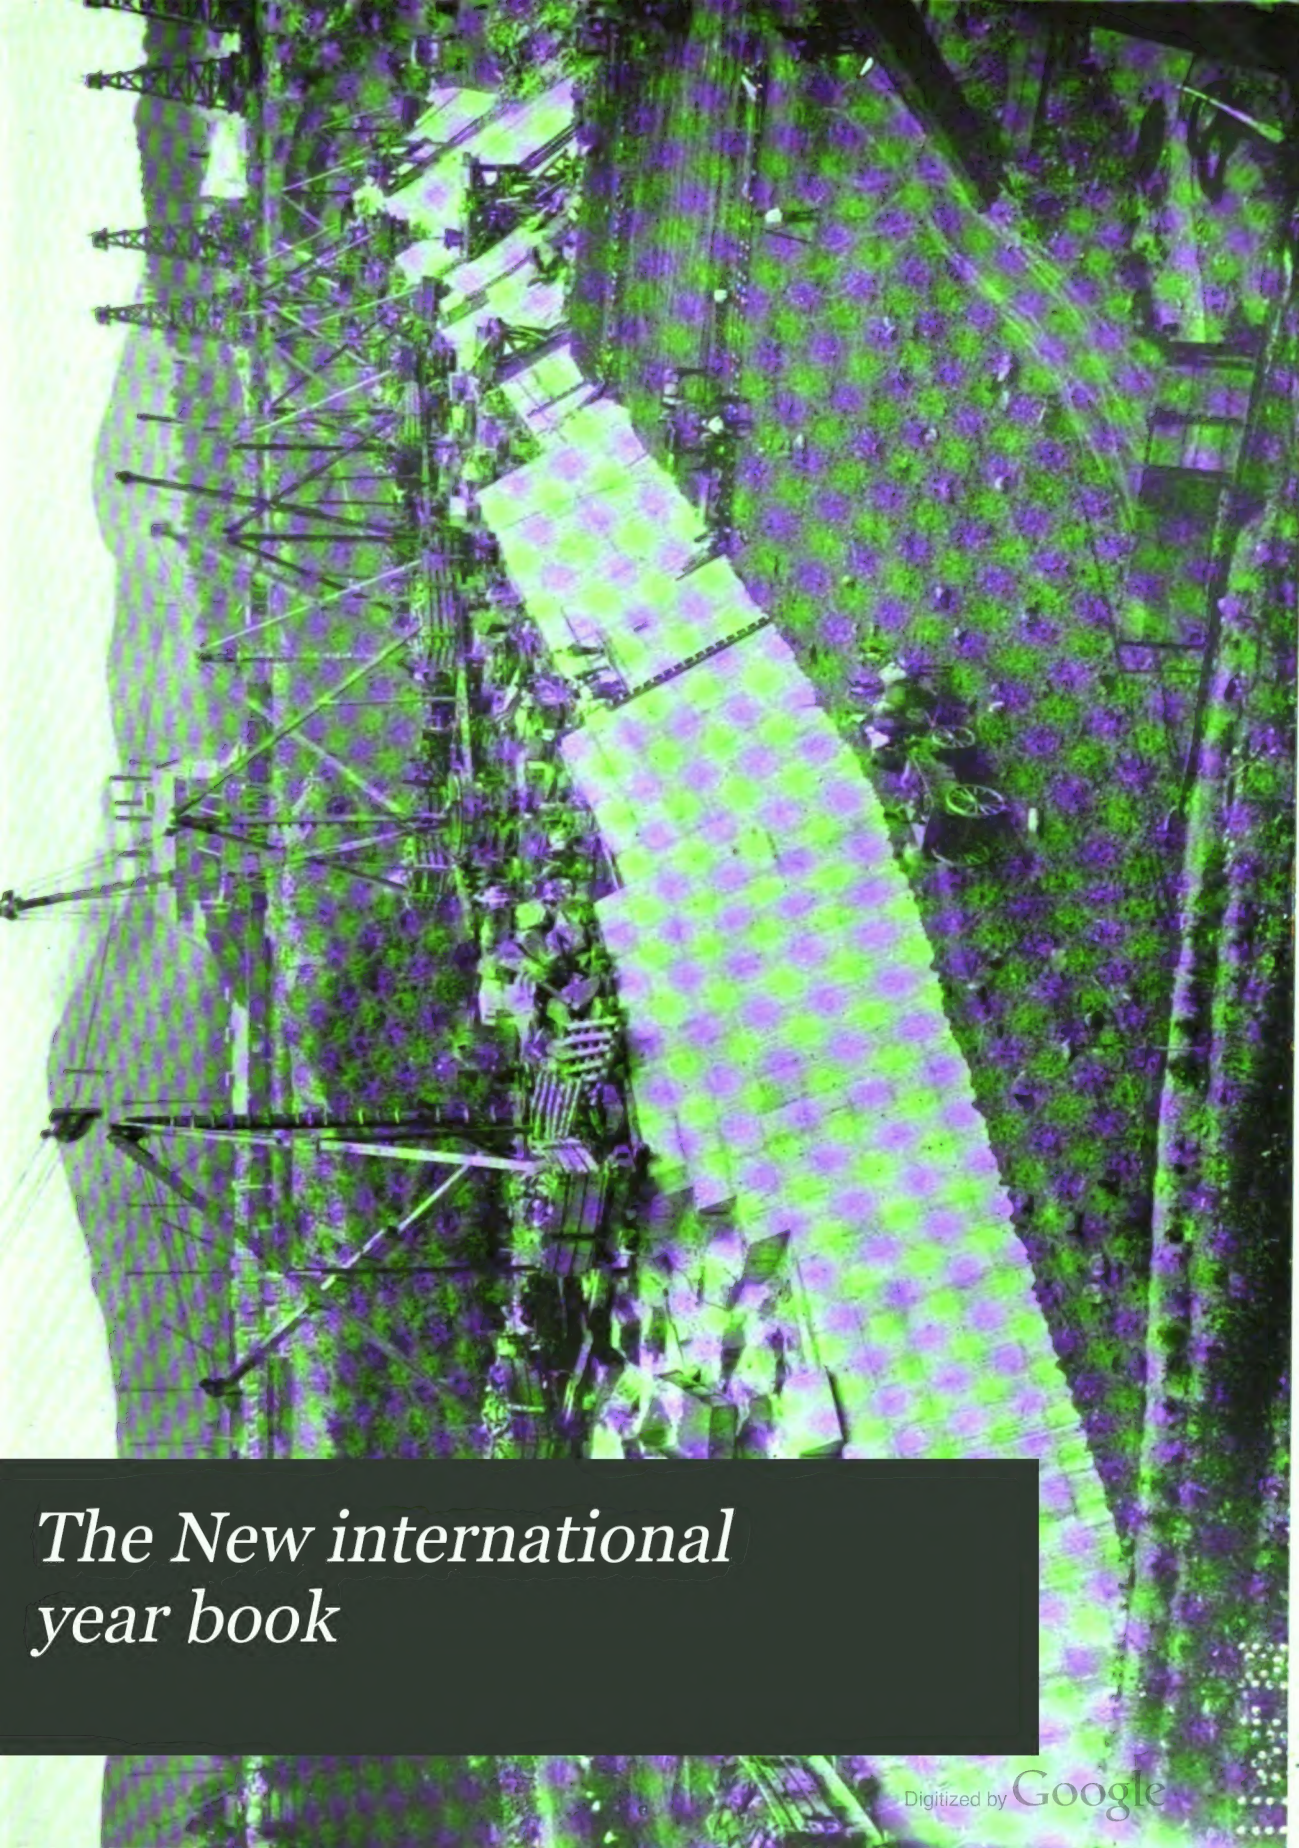

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

## PREFACE

The NEW INTERNATIONAL YEAR BOOK for 1910 is the fourth volume in the new series which began with the YEAR BOOK for 1907. Its scope, as remarked in the prefaces to preceding volumes, is more extensive than that of other annual publications. It is designed as an encyclopædia of the year. It contains a minimum amount of introductory matter that space may be gained for the treatment of subjects appropriate to the year itself. It consists of new articles, not of articles revised from year to year. It is not dependent on any other work of reference. In its eight hundred and odd pages, with about 1100 words to the page, it has been possible to include a more comprehensive account of matters pertaining to the year than can be found within any other single volume. The exceptional size of the volume admits exceptionally full treatment of BIOGRAPHY and CURRENT HISTORY and POLITICS. It lessens the danger of an arbitrary and irrational selection of topics and it makes room for the presentation of both sides in the discussion of disputed questions. For convenience of reference the alphabetical arrangement has been strictly followed, and a free use of cross-references renders an index unnecessary.

Among the noteworthy features of the year's record in this country were the following: It was the year of the Thirteenth Census and before its close a portion of the returns were available. The new methods of the Census Office, a description of the work done to the close of the year and a list of towns and cities of 5000 inhabitants and over, with their populations, are given in the article UNITED STATES CENSUS. In political affairs the chief event was the great Democratic victory in the autumn elections, an account of which is given in the political paragraphs under the UNITED STATES. The electoral campaign required unusually full treatment owing to the variety and interest of the issues presented. Under NEW YORK, for example, the spirited Roosevelt campaign is given in some detail; under the title NEW NATIONALISM is presented a summary of the policies outlined in that programme; the subject of CONSERVATION receives extended treatment; the Ballinger-Pinchot affair and the questions to which it gave rise are described under PUBLIC LANDS and in the paragraphs on Administration under the UNITED STATES; the course of the insurgent movement among the Republicans is recounted under the UNITED STATES and in the historical paragraphs in the separate articles on States; and in the paragraphs on Congress in the article on the UNITED STATES will be found an outline of the important laws passed by the Sixty-first Congress, embodying practically all of President Taft's legislative programme.

Striking features of State political history in 1910 were, in addition to the Roosevelt campaign in New York already mentioned, the Lorimer episode in Illinois; the failure in Maryland to bring about virtual negro disfranchisement; the adoption of woman suffrage in Washington and the employment of the recall in Seattle—the second instance of its use in a large American city; the election of Caleb Powers, who was three times convicted of complicity in the murder of Governor Goebel, as Member of Congress from Kentucky; the vote of Maine, foreshadowing the resubmission of the Prohibition law; the graft prosecutions in Pennsylvania and in New York; and the election of a Socialist mayor of Milwaukee. The developments of the year also made it necessary to carry an exceptionally full discussion of such subjects as the REFERENDUM AND INITIATIVE; DIRECT ELECTION OF SENATORS; PRIMARY ELECTIONS; NOMINATION REFORM; MUNICIPAL GOVERNMENT, with a list of of the commission cities; and PROHIBITION, with an account of the methods of regulating the liquor traffic employed by the various States on December 31, 1910. The workings of the Tariff during the first year of its application and the questions to which it gave rise are discussed in the article TARIFF, and in commercial paragraphs under UNITED STATES. Other articles dealing with matters that attracted wide attention during the year are, FINANCIAL REVIEW, BANKS AND BANKING, POSTAL SAVINGS BANKS, TRADES UNIONS, TRUSTS, STRIKES AND LOCKOUTS, ARBITRATION (Industrial), ARBITRATION (International), and TAXATION.

In foreign politics the sharp controversy over the Budget and the Reform of Lords in Great Britain, the death of King Edward VII, the dissolution of Parliament and the general election, which left the relative strength of the political parties virtually unchanged and the political issues as acute as ever, made the British record an uncommonly full one. In France the outstanding event of the year was the great railway strike and M. Briand's summary manner of dealing with it. In Germany the chief interest centred in the failure of the Prussian franchise movement, in the new alignment of political parties and in the steady growth of the Social Democracy. In the Far East the question of neutralizing the Manchurian Railway drew public attention at the beginning of the year, and the Russo-Japanese agreement was the chief topic of discussion in the closing months. In internal affairs the main subject of interest was China's advances toward parliamentary government. In international relations important subjects requiring discussion were the CRETAN difficulty, the resumption of friendly relations between RUSSIA and AUSTRIA-HUNGARY, the question of reciprocity between CANADA and the UNITED STATES, the relations between TURKEY and BULGARIA, etc. The year was marked by two successful revolutions, one in PORTUGAL and one in NICARAGUA.

As to the articles on arts, sciences, humanities, industries and other classes of articles, the same departments and contributors as appeared in previous YEAR BOOKS have been retained, but have been supplemented this year by a discussion of COPYRIGHT by Mr. Thorvald Solberg, of LIBRARY PROGRESS by Miss M. R. Haines, of MILITARY SCIENCES, PROGRESS by Capt. O. E. Hunt, and of TERRESTRIAL MAGNETISM by Dr. L. A. Bauer. Among the subjects that required especially full treatment on account of important changes or exceptional interest in them during the year, were ARCHITECTURE, which includes a discussion of city and town planning; (also treated under MUNICIPAL GOVERNMENT); AERONAUTICS, which required extended treatment not only under its own head but in relation to MILITARY PROGRESS and NAVAL PROGRESS, and many topics in ENGINEERING, MEDICINE, SANITATION, PSYCHOLOGY, MUSIC and ARCHEOLOGY.

The material for the statistical articles is derived from official sources, and in the preparation of these articles as well as of those which deal with public affairs, especially in the United States and Canada, invaluable aid has been given by government officials. Among those to whom special recognition is due for such services may be mentioned the following: Major Frank McIntyre, Acting Chief of the Bureau of Insular Affairs, for information in regard to the Philippines; Mr. O. P. Austin, Chief of the Bureau of Statistics, Department of Commerce and Labor; Mr. E. Dana Durand, Director of the Census; various officials in the Departments of War, Navy and the Interior; the Superintendents of Education, Commissioners of Charities and Corrections, Treasurers, the officers of colleges, societies and religious bodies; and the editors of leading newspapers in the States, who have coöperated in the preparation of the paragraphs on State politics and history.

Dodd, Mead and Company desire to express their indebtedness for the use of illustrations as follows: To *Current Literature*, for portraits of William James, Julia Ward Howe, A. J. Balfour, Leo Tolstoy, J. Q. A. Ward, Robert Koch, Mme. Curie, Edward VII., José Canalejas, A. A. Michelson and Sir J. J. Thomson, and for the illustration of George Grey Barnard's sculptures for the Pennsylvania Capitol; to the *Review of Reviews* for the portrait of H. H. Asquith; to Harper and Brothers, for the portrait of William J. Rolfe; to the *National Geographic Magazine*, for illustrations of the Eagle Dam Project and Shoshone Dam; to the *Century Magazine*, for the illustration "A German Tragedian"; to the *American Journal of Archaeology*, for illustrations of excavations at Sardis; to the Bureau of Insular Affairs for the illustration of "A Philippine Conference"; to Captain O. E. Hunt, U. S. A., for illustrations of New Fighting Equipment, United States Army; to the Isthmian Canal Commission for illustrations of the Panama Canal; and to Knoedler and Company for the portrait of Winslow Homer.

NOTE: Cross references in SMALL CAPITALS indicate that the allusion is to a separate article; cross references in *italics* denote that the reference is to a subdivision of a main article. A cross reference in *italics*, standing alone in an article, carries the reference to another subdivision of the same article. The letters q. v. (*quod vide*=Latin "which see") in parenthesis following a word, indicate that the subject is treated under its own name elsewhere in the volume.

NOTE: In certain tables in this work it will be found, by addition, that the totals do not correspond to the sum of the items. This is the result of the omission or inclusion of certain small items which are not mentioned in the table, but are included in the totals. This is a usage frequently employed in the compilation of government statistics, from which sources the greater number of the tables in the YEAR BOOK are taken.

# THE NEW INTERNATIONAL YEAR BOOK

**A**BBOTT, EDITH. See LITERATURE, ENGLISH AND AMERICAN, section *Political and Social Science*.

ABYDOS. EXCAVATIONS IN. See ARCHAEOLOGY.

**ABYSSINIA.** An independent empire of eastern Africa, composed of the kingdoms of Tigré (with Lasta), Amhara (with Gojam), and Shoa, together with territories and dependencies in the south and southeast and large portions of the Galla and Somali lands. The estimated area is 308,000 square miles; the population, between nine and eleven millions. Addis Abba, the capital, has an estimated population of between 30,000 and 35,000; Harrar, 50,000; Gondar, 5000; Aksum, 5000; Mahdera-Mariam, 4000; Adua, 3000. The population is made up of Semitic Abyssinians, Hamitic Gallas and Somalis, Negroes, Falashas, and non-natives. The Abyssinians are members of the Alexandrian Church; their head bishop is a Copt, controlled by a native *echegheh*. Education, compulsory since 1907 for male children, is provided by the state, which supplies Coptic teachers.

Stock raising and agriculture are the principal occupations of the people. In the low, hot regions sugar-cane, cotton, coffee (average annual yield, 10,000,000 lbs.), indigo, bananas, etc., are grown, and rubber is indigenous; fruits, cereals, tobacco, and potatoes thrive on the plateaux; while the heights furnish excellent pasture. There are few minerals; iron, coal, gold, etc., have been found in varying quantities. Imports and exports in 1905, 14,091,000 and 16,903,000 francs respectively (exports of coffee, 2,726,000 francs; skins, 2,182,000; ivory, 1,596,000; wax, 917,000.) Later statistics are incomplete; an English source gives an estimate for 1908 of about £365,000 imports and £375,000 exports. A railway (French) from Jibuti to the capital is under construction; the first stage is completed to Diré Dawa (193 miles.) Posts and telegraphs (over 1000 miles) are under French management. The Menelek dollar (the talari, worth about 50 cents) is the official standard.

A *ras* (prince, or feudal chief) governs each kingdom, under the emperor who, as king of Shoa, became ruler of all Abyssinia in 1889 under the name Menelek II (born 1843). The heir-apparent, Prince Lidj Jeassu (or Eyassu), son of Menelek's daughter, took over, March 23, 1910, the administration of affairs, under the guardianship of Ras Tassama. This step was advocated by the principal chiefs on account of Menelek's failing strength. Lidj Jeassu was born in 1896; was proclaimed heir-apparent in 1908; and married, May 16, 1909, Princess

Romanie (born 1902), granddaughter of the late emperor, John.

**ARMY.** The king of Abyssinia maintains a permanent or active army of *wottader* or mercenaries which consists of imperial troops and troops from the tributary provinces. The former, which are in large part mounted and supplied with artillery, comprise in the aggregate about 60,000 men. The tribal troops, estimated to number about 80,000 in all, have an organization similar to that of the imperial army. The Abyssinian army in time of war could be increased to about 200,000 men, but only a part of these would be armed with modern rifles and these would be of different patterns.

In 1910, as in the previous year, there were frequent rumors of the Emperor Menelek's approaching death. In the autumn of 1910 there was a threatened rebellion in Northern Abyssinia, where the brother of Queen Taito raised his standard, but early in November it was announced that the regency was completely successful, the insurgent leader having rendered his submission, and that peace was restored in the disturbed provinces.

**ACADEMIES, INTERNATIONAL ASSOCIATION OF.** A body established in 1899 on the initiative of the British Royal Society. It represents twenty academies of learned societies in Europe and America. Delegates of the constituent bodies meet once in every three years. Meetings were held in Paris, 1901, London, 1904, and Vienna, 1907. The Association is preparing an international catalogue of scientific literature. It is also undertaking a complete edition of the works of Leibnitz and an Encyclopædia of Islam and considering plans for the interchange of manuscripts and books between different countries. In England the Royal Society represents the science section, and the British Academy the letters section of the Association.

**ACADEMY.** With the exception of the British and French Academies given below, Academies are treated under the title which indicates their purpose or nature: for example, American Academy of Arts and Letters under ARTS AND LETTERS, AMERICAN ACADEMY OF; American Academy of Political and Social Science, under POLITICAL AND SOCIAL SCIENCE, AMERICAN, etc.

**ACADEMY, BRITISH FOR THE PROMOTION OF HISTORICAL, PHILOSOPHICAL AND PHILOLOGICAL STUDIES.** A learned society incorporated in 1902. Its object is the promotion of studies of the moral and political sciences, including history, philosophy, law, politics, archæology and philology. The maximum number of fellows of

the Academy is 100. In 1910 there were 99 distributed under four main sectional committees, which with their chairmen are as follows: History and Archæology, Lord Reay; Philology, Dr. F. G. Kenyon; Philosophy, Professor Bosanquet; Jurisprudence and Economics, Sir W. R. Anson. The President of the Academy, Professor S. H. Butcher (q. v.), died during the year. The secretary is Professor I. Gollancz.

**ACADEMY, FRENCH (ACADÉMIE FRANÇAISE).** An institution founded in 1635 by Cardinal Richelieu, and reorganized in 1810. It is the first of the five academies constituting the Institute of France, the other four being: the Academy of Inscriptions and Belles-lettres, Academy of Sciences, Academy of Fine Arts, and Academy of Moral and Political Science. The Academy consists of forty members. It is the chief tribunal of questions relating to the niceties of the French language and of grammar, rhetoric, poetry and the classification of French classics. The members receive an annual stipend of 1500 francs, and in addition the six members of the Dictionary Committee receive each 1000 francs annually. The Academy annually distributes 12,000 francs in prizes alternately for poetry and eloquence, besides a number of smaller prizes. One new member, Monseigneur Duchesne, was chosen in 1910 to fill the vacancy caused by the death of Mathieu. There were four vacancies at the end of 1910, caused by the deaths of Marquis Costa de Beauregard (1910), Eugène Marie Melchior (1910), Comte Vandal (1910), and Henri Barboux (1910). The present academicians and the dates of their election are:

Emile Ollivier, 1870; Alfred Jean François Mézières, 1874; Othénin P. de Cléron, Comte d'Haussonville, 1886; Jules Arnaud Arsène Claretie, 1888; Charles Louis de Saulles de Freycinet, 1890; Louis Marie Julien Viaud (Pierre Loti), 1891; Ernest Lavisse, 1892; Paul Louis Thureau-Dangin, 1893; Paul Bourget, 1894; Henri Houssaye, 1894; Jules Lemaitre, 1895; Jacques Anatole Thibault (Anatole France), 1896; Albert, Comte de Mun, 1897; Gabriel Hanotaux, 1897; Henri Léon Emile Lavedan, 1899; Paul Deschanel, 1899; Paul Hervieu, 1900; Auguste Emile Faguet, 1900; Charles Jean Melchior, Marquis de Vogüé, 1901; Edmond Rostand, 1901; Frédéric Masson, 1903; René Bazin, 1903; Etienne Lamy, 1905; Alexandre Félix Joseph Ribot, 1906; Maurice Barrès, 1906; Marquis de Ségur, 1907; Maurice Donnay, 1907; Jules Henri Poincaré, 1908; Jean Richepin, 1908; Francis Charmes, 1908; René Doumic; Marcel Prévost; Jean Aicard; Eugène Brieux; Raymond Poincaré, 1909; Monseigneur Duchesne (1910).

**ACCIDENTS IN COAL MINES.** See COAL.

**ACCIDENTS, RAILWAY.** See RAILWAYS.

**ACETYLENE MINE LAMPS.** See COAL.

**ACHENBACH, ANDREAS.** A German landscape painter, died April, 1910. He was born at Cassel in 1815. While still a boy he became a pupil of Schadow at Düsseldorf, where he became associated with his brother, Oswald. He was the first great realist in landscape, modeling his art on the Dutch painters of the 17th century. Many of his works are in private galleries in the United States. He is represented in the Metropolitan Museum, New York, and in the Pennsylvania Academy, Philadelphia.

Among his principal works are "Hardanger Fjord" (1843); "The Pontine Marshes" (1846), and "The Fish Market at Ostend" (1866).

**ACTON, JOHN ADAMS.** An English sculptor, died Oct. 31, 1910. He was born at Acton, Middlesex, in 1831, and was educated at Lady Byron's School, Ealing. He received his training as a sculptor at the Royal Academy Schools, where he took several first-class and gold medals and gained a traveling studentship. He was sent to Rome under the presidency of Sir Charles Eastlake and remained in that city ten years. During a portion of this time he was a pupil of Gibson. His best known works in sculpture are portrait busts of Queen Victoria, King Edward VII. and Queen Alexandra. The Wesley Memorial at Westminster Abbey was his work. He also produced the George Cruikshank monument at St. Paul's Cathedral, and notable statues of Gladstone and Beaconsfield.

**ACTON, LORD.** See LITERATURE, ENGLISH AND AMERICAN.

**ADAM, PAUL.** See FRENCH LITERATURE.

**ADAMS FUND.** See AGRICULTURE EXPERIMENT STATIONS.

**ADDAMS, JANE.** See LITERATURE, ENGLISH AND AMERICAN, section, *Biography*.

**ADEN.** A British dependency on the Arabian coast; a part of the Bombay Presidency. Area, 75 square miles; population (1901), 41,222, against 44,079 in 1891. The island of Perim (area, 5 square miles; population, 2752), the Kuria Muria Islands (5 in number), and the Aden Protectorate (area, 9000 sq. miles; pop. about 100,000) are attached to Aden. The peninsula is of volcanic origin and non-productive, the trade being almost entirely one of transshipment. It is an important coaling station, and by reason of its strategic position is strongly fortified. Imports (1908-9) by sea, £2,805,260; by land, £157,960; treasure, £415,568. Exports by sea, £2,580,770; by land, £95,260; treasure, £1,575,780. These figures are exclusive of government stores and treasure. The chief articles of trade are coffee, gums, grain, piece goods, hides and skins and tobacco. In 1908-9, 1306 vessels (merchant) of 2,958,965 tons net entered the port of Aden. Under the Bombay government, the settlement is administered by a political resident (1910, Major-General E. de Brath), who is also in command of the troop.

**ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE.** A learned society which exists as a continuation of the American Association of Geologists and Naturalists, organized in 1840. In its present form it was chartered in 1874. The association is made up of eleven sections: mathematics and astronomy, physics, chemistry, mechanical science and engineering, geology and geography, zoölogy, botany, anthropology and psychology, social and economic science, physiology and experimental medicine, and education. Annual meetings of the association are held in different cities of the United States. The meeting of 1910 was held at the University of Minnesota, Minneapolis, December 27-31. This was the 62nd annual meeting of the association. The registered number of members in attendance

**ALBERT ABRAHAM MICHELSON**  
**PRESIDENT OF THE AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, 1910-11**

1870

was approximately 500, but the actual attendance was not far from 1200. It was one of the most successful meetings in point of numbers ever held. This fact was of especial interest as it had been questioned whether a successful and well attended meeting of the association could be held in the Middle West.

There were three public addresses during the meeting. The retiring president, Dr. David Starr Jordan, delivered an address on "The Making of a Darwin." Mr. W. A. Bryan gave an illustrated public lecture on the Hawaiian volcano of Kilauea, and Mr. A. B. Stickney delivered a public lecture on the subject Should Agriculture and the Physical Development of Childhood be added to the Curriculum of the Public Schools? A symposium on aviation under the auspices of the section on mechanical science and engineering was also of popular interest. The section on mathematics and astronomy held a joint session with the American Mathematical Society. The section on chemistry held no session apart from the session for the delivery of the vice-presidential address. All sessions of the general programme in this section were essentially joint sessions, though under the auspices of the American Chemical Society. Sixteen papers were read before the Division of Agriculture and Food Chemistry, 12 before the Division of Fertilizer Chemistry, four before the Division of Pharmaceutical Chemistry, and eight before the Chemical Educational Section. In the Division of Inorganic Chemistry 47 papers were given and many papers were read before the Biological Section, before the Industrial Chemists and Chemical Engineers and before the Division of Organic Chemistry. In the symposium on aeronautics referred to above, 12 papers were presented. Before the Section on Geology and Geography papers were presented on economic geology, on structural geology, glacial geology and geography. The Section on Zoölogy met in joint session with the central branch of the American Society of Zoölogists, and 43 papers were read at these sessions. The Section on Botany met jointly with the Botanical Society of America and the American Phytopathological Society, Seventy-one papers were presented at the Botanical sessions. The Section on Anthropology and Psychology held no meeting, but the American Psychological Association and the Western Philosophical Association met in joint session and in session with the Section on Education. Thirty-four papers were presented. In the Section on Social and Economic Science 12 papers were read. In the Section on Physiology and Experimental Medicine, there was a symposium devoted to the subject, "Diseases due to Filtering Organisms." The Section on Education met in joint session with the American Psychological Association for the discussion of the topic, "Educational Psychology" and in joint session with the American Federation of Teachers of Mathematical and Natural Science to discuss the topic, "Methods of Testing the Results of Science Teaching."

Among the important actions taken by the Council was the preparation of a resolution requesting the Postmaster-General to give careful attention to the effects of any ruling of the Post Office Department that might limit the advancement and diffusion of science throughout the country. This was in view of the proposed change of rates in second-class matter. The

election of the Fellows of the Association was placed on the basis of professional work in science in the hope that greater uniformity would then be secured in the action of sectional committees. The next meeting of the Association will be held in Washington, from December 27 to 30, 1911. The following officers were elected: President, C. E. Bessey; Vice-Presidents; Section A, Mathematics and Astronomy, E. B. Frost, Yerkes Observatory; Section B, Physics, R. A. Milliken, Chicago University; Section C, Chemistry, F. K. Cameron, Department of Agriculture, Washington; Section D, Mechanical Science and Engineering, C. S. Howe, Case School of Applied Science; Section E, Geology and Geography, Bohumil Shimek, University of Iowa; Section F, Zoölogy, H. F. Nachtrieb, University of Minnesota; Section G, Botany, F. C. Newcombe, University of Michigan; Section H, Anthropology and Psychology, G. T. Ladd, Yale University; Section I, Social and Economic Science, no election; Section K, Physiology and Experimental Medicine, Dr. W. T. Porter, Harvard University; Section L, E. L. Thorndike, Columbia University; General Secretary, John Zeleny, University of Minnesota; Secretary of the Council, T. S. Palmer, Washington, D. C.

**ADVANCEMENT OF SCIENCE, BRITISH ASSOCIATION FOR THE.** A learned society, founded at York, England, in 1831 for the purpose of stimulating scientific inquiry, for promoting the intercourse of scientific men and for evoking public interest in the progress of science. The Association holds its meeting annually in important cities of the United Kingdom and of the colonies. It does not hold meetings in London. The meeting of the Association in 1910 was held in Sheffield. The inaugural address was delivered by Rev. T. J. Bonney, the President-elect. This address dealt with problems of the Ice Age. In the mathematical and physical section Professor E. W. Hobson delivered an address on the scope and tendencies of modern mathematics. In the same section, Sir J. J. Thomson read a paper on the cathode rays. Sir William Ramsay and Sir W. Gray announced the result of the emanation of radium and declared it to be a gas of the argon type. See **CHEMISTRY**. Important addresses were made also in the other sections, which include the agricultural section, geological section, zoölogical section, geographical section, engineering section, physiological section, botanical section, educational science section, anthropological section and the economic science and statistics section. In the last named section a valuable report was presented by Professor Cannan on the number and amount of incomes below the income tax limit. The President of the Association is Professor T. J. Bonney, and the general secretaries are Major A. P. MacMahon and Professor W. A. Herdman. The next meeting of the Association will be held in Portsmouth under the presidency of Sir W. Ramsay.

**ADVENTISTS, SEVENTH DAY.** A religious denomination which originated in 1845. It is based on the belief that the second coming of Christ is near at hand, founded on the fulfillment of the historic prophecies of Daniel and Revelation and on the teachings of Christ regarding signs of his first appearance in Matthew 24, and Luke 21. Many who at first composed the organization had been associated with the Advent movement of 1840-44, which numbered

thousands of believers in the United States and Europe. One of the leading doctrines of the believers at that period was that Christ would come in 1844, according to the prophecy of Daniel 8:14, and the passing of that date and the consequent disappointment led to further investigation with the result that those who later founded the Seventh-day Adventist body saw that, instead of this earth being the sanctuary to be cleansed, the sanctuary referred to was the temple of Christ's ministry in heaven, the cleansing being the work of investigation and judgment described in Daniel 7:10, to precede the second advent. Thus there arose in New England in 1845 a body which, while believing in the second coming of Christ have never set a date for that event, but hold to the Scripture statement that it is near. According to the United States census of 1906, published in 1910, the Seventh-day Adventists numbered 62,211 communicants, 488 ministers and 981 churches. The property was valued at \$1,454,087. In the Sunday Schools of the denomination there were 50,225 scholars with 11,033 teachers. According to data gathered by officers of the denomination, there were at the close of 1910, 22 union conferences, 107 local conferences, 135 foreign mission stations, 33 being in non-Christian lands, and over 2500 churches in eighty of the principal countries of the world, with 100,931 communicants. The denomination spent in 1910 approximately \$2,000,000 for the support of evangelical work. In institutional lines the work is represented by 83 colleges, academies and intermediate schools, and 579 primary schools. There are 27 denominational publishing houses which print 125 papers. The publications are issued in 65 languages. The denomination also operates over 80 sanitariums, with which there are connected over 2000 physicians and trained employees. The next general conference of the denomination meets in 1913.

In addition to the Seventh-day Adventists there are several bodies bearing the name of Adventists which have practically nothing in common with the former, except possibly the doctrine of the second coming of Christ, and even there the connection is remote. These bodies, with their membership in 1906 are as follows: Evangelical Adventists, 481; Advent Christian Church, 26,709; Church of God, 354; Churches of God, unattached congregations, 257; Life and Advent Union, 509; Churches of God in Christ Jesus, 2124.

**ADVERTISEMENTS.** See SCENIC AND HISTORIC PRESERVATION SOCIETY.

**AERONAUTICS.** Following the usual custom of the YEAB BOOK, the material dealing with the progress of the navigation of the air in 1910 will be found treated under this head, although such topics as mechanical flight by machines heavier than the displaced air are quite different from questions involving merely spherical balloons which drift in the air as driven by winds and air currents. Accordingly below will be found a division into aviation, dirigible balloons, and aerostats or non-dirigible balloons, while under MILITARY PROGRESS will be found several paragraphs discussing the application of aeroplane and dirigible to war.

#### AVIATION

The year 1910 was memorable in the development of aviation for the large number of remarkable exploits. Various prizes and competitions stimulated the activity of the aviators;

and while there was a regrettable loss of life due to failures of machines and other accidents, yet in the main considerable progress was made, and this was manifest in the constant improvement during the year in the records for distance, speed and altitude. The list of inventors and aviators engaged in practical flying with various types of machines grew rapidly and at the end of the year was truly remarkable. This was shown by the fact that on December 31 there were 42 machines in flight for records for the Michelin Cup.

During the year the different features of the difference types of aeroplanes were carefully considered and in many cases these were adopted or modified, so as to combine in a single machine the most efficient methods of arrangement and manipulation. The wing warping method for lateral control which originated in America with the Wright brothers and was one of the fundamental features of their biplanes continued to be the prevalent method for lateral control, yet the ailerons which were important elements of the Curtiss aeroplane found use on other types of machines. Most biplanes adopted the rear elevating rudder which was found to give fore and aft stability so successfully to the monoplanes. The perfection to which the aeroplane motor had been brought in previous years did not leave room for great improvement in itself and the favorite motor seemed to be the revolving Gnome on account of its reliability and the light weight for the power produced. Aeronautical engineers were pleased to state that a distinct type of motor for aviation had been evolved and that they were quite independent of the automobile engineers. Many of the accidents that occurred to different aeroplanes were found to result from defective construction, and it was the general opinion that design and making must be very carefully considered and a larger safety factor introduced in making the machines.

At the beginning of the year the leading types of machines seen in the United States and Europe were the Wright, Curtiss, Voisin and Farman biplanes, and the Antoinette, one-seated Bléruit, the two-seated Bléruit and the Santos-Dumont monoplanes. All of these underwent greater or less improvement during the year under review.

**BIPLANES.** The new Wright machines brought out in 1910 were conspicuous by the absence of the double surface horizontal rudder elevating in front. The tail surface had an elevating rudder and the two vertical surfaces which were formerly placed in front of the aeroplane were cut down in amount and were carried on the skids. The vertical portions of the Voisin biplane used to give lateral stability similar to those of the cellular kite were replaced by ailerons which were employed also by Curtiss and Farman. Lateral stability was obtained either by employing these ailerons, or, as was done by the Wrights, by warping the sustaining planes, though this is apt to weaken the transverse frame of the machine. The warping device, however, is found generally in monoplanes, but in the very large biplanes the ailerons are more generally employed. The horizontal rudder behind was found in the case of the Voisin and Henri Farman biplanes, while in the machines of Maurice Farman and Sommer the combined forward and aft rudders are used. French critics at the end of the year believed that the

single horizontal rudder placed at the stern brings the monoplane nearer to the model of a bird and preserves equilibrium better than the use of the forward rudder often seen in the American type of biplane. Two new French biplanes appeared during the year, those of Bréguet and Goupy. With two surfaces a greater load can be carried on account of more sustaining power, and this was considered one of the strongest points in favor of the biplane, the monoplane making during the year some wonderful speed records.

**MONOPLANES.** But little change was noted in the construction of monoplanes during the year except their gradual improvement and better adjustment. This type of aeroplane opposes less resistance to forward motion and therefore secures greater speed with equal power, as was clearly demonstrated in many important flights and competitions. It was found to maintain its equilibrium better in high winds on account of its greater velocity and its greater weight in proportion to its surface, and because the single support surface was less affected by gusts and eddies in the atmosphere than the double surface of the biplane. In fact one of the most important lessons of the Rheims aviation meet was that the monoplanes fared much better in weathering a gale. The Antoinette monoplane remained in exactly the same form at the end of the year as it was at the beginning, and but few modifications were made in the one-seated Blériot. The double-seated Blériot was made with seats side by side for pilot and passenger, and this promised increased usefulness for military reconnoitering as the observer was independent of any operation of the machine. The Santos-Dumont monoplane also remained unchanged and achieved considerable success during the year. Its deficiency was thought to lie entirely in the motor as all the machine needed apparently was a sufficiently light, low-powered motor, a type which had not been developed to the needed efficiency and reliability.

A new French monoplane of the year was the Hanriot, similar in many respects to the Antoinette and showing some good performances. The Tellier machine was a modified Blériot, while the Nieuport was built with very small resistance to forward motion. The Sommer monoplane also resembled that of Blériot. Typifying the tendency of French inventors to copy the general form of the bird was the monoplane of Esnault-Pelterie, which resembled a great bird and was considered by many one of the most beautiful of the monoplanes of the year.

**CONSTRUCTION AND CONTROL.** All of these typical machines were made in different sizes, varying as regards the power of their engines and the areas and curvature of their planes. Many of these resulted from practical tests with the dynamometer, though the building of aeroplanes was still more a matter of experiment than of calculation. Increased safety was procured by placing the aviator behind the motor, and this was typical of the more recent machines, though in others the pilot was placed either in front or at the side as in the case of the Wright machine. Practically all aeroplanes now start from wheels, the Wright brothers being among the last to adopt this method, though with machines of increasing size and power it may be necessary to employ again the skids and rails as used with the first Wright aero-

plane. The best practice at the end of the year was considered to employ both skids and wheels, the former being used in landing to take the load from the wheels and stop the machine quickly, or to land on the skids alone.

The control of many of the different types of machines did not vary greatly although naturally there were minor differences and often aviators were able to handle the machines of different makers. With many of the latter, stock sizes were developed and machines with all their parts carefully finished were being turned out from European factories. Steel tubes were beginning to be used for the frames not being as liable to be warped as wooden frames, especially when exposed to dampness. The matter of wood and steel for frames was an open question there being advantages for both materials, but the use of steel ropes in the place of piano wire was becoming more general. The wooden propeller was being used almost entirely in place of the metal propellers originally employed by some makers and for them a direct drive was preferred. The propellers were increased in size from about 7 feet to 8½ or 9 feet and were used singly except in the case of the Wright or the Lioré, where twin propellers were used.

**AEROPLANE MOTORS.** In regard to motors for aeroplanes we have noted that a distinct type of aeroplane motor had been evolved and no longer were makers of monoplanes and biplanes dependent on the work of automobile engineers. One of the best performances of the year was that of the Antoinette water-cooled motor which accomplished 13,000 miles in one week at the Bordeaux aviation meeting. Such a record would be an enviable one for an automobile engine and when it was recalled that this is the work of a powerful engine where extreme lightness of weight was the prime requisite, it was most extraordinary.

All things considered, however, the Gnome motor was considered the best of the light weight types as it was employed with many machines accomplishing notable flights. It was demonstrated during the year that this motor was as well adapted to monoplanes as to biplanes, and its gyroscopic action did not have the dangerous effects anticipated. The rotary motor had become an established fact and was thought to represent a true type of aeroplane motor which eventually must take the form of the gas turbine engine. Aviators were demanding a lightness and a small consumption of fuel.

**NEW TYPES OF AEROPLANE.** The most original and interesting aeroplanes of the year exhibited at the Paris Aviation Salon were those of Fabre and Coandré. The Fabre machine had a trussed frame of considerable strength and was able to rise from and to light on the water, being the first aeroplane to accomplish this feat successfully. The Coandré aeroplane was designed to reduce to a minimum the resistance to progressive motion and had wooden wings which some critics considered lacking in strength. The inventor at the end of the year was engaged in developing a turbine which he hoped would produce considerable power. The Paris Aviation Salon was not, as usual, productive of novelties and it was stated that the leading inventors and manufacturers were developing and testing machines in which new ideas were embodied rather than exhibiting in their latest achievements. In their behalf it was said

that the mechanical and commercial reputations of such makers as the Wrights, Blériot, Farman, Voisin and others had reached a point where they did not dare to show an invention in an experimental stage.

Critical authorities in 1910 reached the conclusion that aviation had arrived at a point where it was not unreasonable to demand aeroplanes of sufficient size and strength for general touring, so built that they would not break in the air and could start from the ground under ordinary conditions. The machine had now reached a point where comfortable cars mounted inside the frame should be installed for the pilot and passengers and these cars should afford protection against any shocks due to landing on bad ground. Another desideratum was a better method of stopping the aeroplane after landing. At the end of the year the opinion was generally advanced that the aeroplane had developed to a point where it could be compared with the early history of the automobile. Thus in a few years the long-distance races would be reached and soon efficient engines and machines for ordinary use would be designed.

On the theoretical side much remained to be done by improving the forms of wings and propellers and diminishing resistance to forward motion. Smaller angles of ascent were possible.

#### MEETS AND COMPETITIONS

During the year there were many aviation meets held at which prizes of great value were offered, so that the professional and exhibition or commercial side in addition to sport and experiments became conspicuous.

**LOS ANGELES MEET.** The first aviation meet to be held in the United States took place at Los Angeles, California, beginning January 10th. For the first time in the United States a number of foreign types of aeroplanes were in competition with those of Americans. Two Farman biplanes and two Blériot monoplanes were shown; also three Curtiss biplanes, operated respectively by C. F. Willard, C. K. Hamilton and Glenn H. Curtiss. The first noteworthy feature of the meeting was the breaking of the world's record for altitude made but six days before by Latham in France. This figure, 3444 feet, was considerably exceeded by Paulhan whose record was 4165 feet. Paulhan further succeeded in showing the weight-carrying abilities of the Farman aeroplane by flying with two passengers. On January 20th, Curtiss made the longest flight that up to that time he had accomplished, passing around the course thirty times or forty-eight and three tenths (48.3) miles in 1 hour, 16 minutes and 39 seconds. Paulhan, however, was able to make thirty-five circuits of the course and a distance of 36.35 miles in 1 hour and 34 minutes and 34 seconds.

**LONDON-TO-MANCHESTER RACE.** An important sporting event took place on April 27th and 28th in England. This was the race between London and Manchester for a prize of \$50,000 offered in 1907 by the London *Daily Mail*. The conditions of the flight provided that the trip should be made within twenty-four hours and with not more than two stops en route. On April 23rd, Claude Grahame-White with a Farman biplane in attempting this distance was forced to give up after traversing 115 miles. On April 27th, Louis Paul-

han started from Hendon and flying to Hampstead, five miles from London, crossed the starting line with a special railway train below to guide him. The news of Paulhan's start came to Grahame-White and an hour later, assembling his aeroplane, he started from Wormwood Scrubbs in pursuit of the French aviator. The latter reached Lichfield, 117 miles from London, and there made a landing, as his supply of gasoline amounting to fourteen gallons was exhausted. Grahame-White alighted at Roade near Northampton, after covering a distance of sixty miles in a flight of one hour and twenty-three minutes. Before daybreak next day he was again in the air traveling as far as Polesworth, nearly 100 miles from London after an hour's flight. Although he flew a few miles farther in the afternoon the race was over as far as he was concerned when he reached Polesworth. Paulhan after his stop at Lichfield finished the remaining 68 miles in one hour and twenty-one minutes, reaching Manchester before the special train that accompanied him, thus winning the *Daily Mail* prize and making a flight that was memorable in the annals of aeronautics.

**CURTISS'S FLIGHT FROM ALBANY TO NEW YORK.** A notable cross-country flight took place on May 6th, 1910 when Glenn H. Curtiss made the trip from Albany to New York in a Curtiss biplane weighing 950 pounds and having a surface area of 236 square feet. This biplane was fitted with a 50-horse-power, eight-cylinder water-cooled motor and the longest time it had been kept going in one flight previously had been 38 minutes. An early morning start was made from Albany against a slight wind and the Hudson River was followed as far as Poughkeepsie, a distance of about seventy-five miles. Three miles beyond the railway bridge a landing was made at Camelot, the seventy-four and one-quarter miles of the journey having been accomplished in one hour and twenty-three minutes or at the rate of more than fifty-three and sixty-eight hundredths miles an hour (53.68 an hour). After renewing the fuel and lubrication the trip was resumed and the second stage of the journey extended as far as the north end of Manhattan Island where one hour and nine minutes after leaving Poughkeepsie a landing was made, fifty-three and three quarters miles being covered in this second stage. The third stage, fourteen miles to Governor's Island, was accomplished in twenty-two minutes, the entire trip being made without the slightest mishap. The Curtiss biplane used in this flight was similar in construction to that employed in winning the Bennett Cup in 1909 at Rheims.

**HAMILTON'S FLIGHT BETWEEN PHILADELPHIA AND NEW YORK.** Hardly had this last achievement been recorded when another interesting American flight was made between Philadelphia and New York. This trip was entirely cross country, no river being followed and consisted of a flight from Governor's Island in New York Bay, across the Bay and the Kill von Kull, following the Pennsylvania Railroad to Philadelphia, the direction being given by a white streamer on the roof of a special train. Hamilton's flight for the greater part of the trip was made at the comparatively low elevation of about two hundred feet and ended at Philadelphia 1 hour and 50 minutes from the time of the start. The average speed was estimated at 47.37 miles per hour or 45.22 miles using the entire time and making no deduction for the

various circlings. The return trip was then attempted and for the first thirty-eight miles of the journey a speed of 51.08 miles an hour was averaged. At this time, the engine not running smoothly, a descent was made which resulted in a broken propeller. This being replaced a second start was made and the machine rose under its own power to a height of fifteen hundred feet and completed the trip to Governor's Island. Hamilton's flight was considered the fastest cross-country flight ever executed at the time it was made.

**INDIANAPOLIS MEET.** An aviation meet was held at Indianapolis during the week beginning June 13th, under the auspices of the Wright brothers. In addition to Orville Wright and other aviators, Walter Brookins participated in the flights and made a height record of 4384½ feet. This was broken two days later and a record of 4503 feet achieved. This meet was confined exclusively to the Wright aeroplanes and while there was good flying on the part of the various aviators, yet no large amount of general interest was aroused as was the case where different forms of machines were used.

**RHEIMS AVIATION MEET.** This great annual event in 1910 began on July 3rd. and was noteworthy for the records of speed and distance made by monoplanes which French manufacturers had brought to an increased degree of perfection. Charles Wachter lost his life by the breaking of the wings of his Antoinette monoplane and a number of new speed records were made. An interesting record for distance was made by a Belgian, Jan Olieslargers, with a Blériot monoplane. He was able to remain aloft five hours and three minutes and cover 244 miles in a closed circuit at an average speed of 48.31 miles an hour. This gave him a record distance, duration and speed in long distance flight, which in the first two respects as we shall see was exceeded before the end of the year.

**HARVARD BOSTON MEET.** On September 2nd, at Boston, the Harvard Aeronautic Society opened a very successful aviation meeting. Many of the famous aviators were present and an interesting feature was a bomb-throwing contest in which the model of a modern battleship was used. The object was to drop a bomb from a height of at least 100 feet so that the deck of the model man-of-war should be hit. A shot within the bulls-eye indicating the smokestacks counted 10 points and hits of less vulnerable places of the ship proportionately less. At one time during this meeting there were four machines in the air, which at this time was quite a novel sight for American spectators. An interesting feature of the meeting was a trip from the aviation field to Boston Light and return twice over, a distance of 33 miles. Grahame-White on September 6th, in a Blériot monoplane made this distance in 41 minutes and 35 seconds. On September 12th this trip was repeated by the same aviator and the time reduced to 34 minutes and 11 seconds. A race between Grahame-White and Curtiss for a \$3000 prize was won by the former and seemed to demonstrate the superiority of the monoplane over the biplane for high speed racing. Ralph Johnstone in a Wright biplane made a world's record for accuracy in lighting; his seat being but 5 feet 4 inches from the marking flag when he touched the ground. He also secured the record for duration and distance by a flight

of 101 miles, 389 feet, in 3 hours and 5 minutes and 40 seconds. An interesting world's record also made at this meet was the slow speed record by Brookins, 13 minutes, 48 seconds for 5½ miles or an average speed of 22.85 miles an hour.

**THE INTERNATIONAL AVIATION MEET.** The first large and important meeting of aviators from Europe and the United States to be held in America took place during the last week of October at the Belmont Park race course near Mineola, Long Island, N. Y. It aroused great interest and afforded the American public an opportunity to see in actual flights various types of machines as well as to enjoy what was certainly a most novel and interesting spectacle. The aviation field in the opinion of many of the foreign contestants left much to be desired, while unusually high winds common to the late autumn prevailed and interfered more or less with the programme. Belmont Park was marked off by tall wooden monuments or pylons into two courses for the various competitions. The short one, 2½ kilometers or about 1½ miles in length, was used for the hourly distance and daily speed contests, a large number of which were held both for the benefit of the spectator and to tempt the aviators by the prizes offered. The long course, 5 kilometers or about 3 1-10 miles, was used for the international trophy race for the Gordon-Bennett Cup. The prizes offered aggregated \$74,800 and exceeded in amount those contested for at any previous aviation meet. The various prizes were divided so that the second, third and fourth men in many of the contests received substantial recognition. This side of the meet was emphasized as the making and operation of aeroplanes had become a matter that only was possible to wealthy amateurs or to inventors and manufacturers seeking direct returns or advertising with a view to selling or exhibiting their machines.

All things considered, the meet was very representative and Europe and America joined in showing the best examples of the aeroplane as it had been developed. The entries were as follows:

*France*—Count Jacques de Lesseps (Blériot), Alfred Leblanc (Blériot), Hubert Latham (100 horse-power Antoinette), René Barrier (Blériot), Emile Aubrun (Blériot), René Simon (Blériot), Rollan Garros (Demoiselle), C. Audemars (Demoiselle).

*England*—C. Grahame-White (Farman and Blériot), James Radley (Blériot), Alec. Ogilvie (Wright).

*America*—Ralph Johnstone (Wright), Walter Brookins (Wright), Arch Hoxsey (Wright), Charles K. Hamilton (Curtiss), John B. Moisant (Blériot), J. A. Drexel (Blériot), C. B. Harmon (Farman), H. S. Harkness (Antoinette), C. F. Willard (Curtiss), J. C. Mars (Curtiss), J. A. D. McCurdy (Curtiss), Eugene Ely (Curtiss).

**TYPES OF AEROPLANES REPRESENTED.** The machines here represented all showed improvements on those seen at earlier contests and especially were attempts made to develop high speed. The Wright brothers with their familiar biplanes had entered a new small racing machine. Curtiss, who also had developed the biplane, was represented by a new machine where the upper surface was cut down to a very small amount, leaving the lower surface as the

main supporting plane and making the machine practically a monoplane. Blériot was represented by a number of monoplanes differing somewhat in size and power and owned by aviators of different nations. The Santos-Dumont "Demoiselle" machines, monoplanes of small surface but capable of considerable speed, were also in evidence. The Farman machine was a biplane, while the Antoinette was a monoplane with powerful engines.

Despite rather unfavorable conditions of weather the aviation meet drew great throngs to Belmont Park and the spectators were vastly interested in the exhibition of flight as well as in the actual contests themselves. At times there were as many as fourteen aeroplanes in flight simultaneously while frequently several were in close proximity above the heads of the onlookers. In fact it was by this circumstance rather than as a sporting event that the week's flying should be judged, though in the various contests there was keen competition.

**GORDON-BENNETT CUP COMPETITION.** The most important of these was the annual competition for the Gordon-Bennett Trophy and prize of \$5000. This was contested for on October 29th and consisted of 20 circuits of the 3.1 mile course or 62.1 miles (100 kilometers). In the early morning with perfect weather conditions three competitors started, Grahame-White of England in a 100 horse-power Blériot monoplane, Alfred Leblanc of France in a 100 horse-power Blériot monoplane, and Alec. Ogilvie of England in a small Wright biplane. Leblanc on his last lap met with an accident in which his machine dove to the ground and, striking a telegraph pole, was wrecked. His time for the 19 laps had been 52 minutes, 49.79 seconds, or an average speed of 67 miles an hour. Ogilvie in his flight was forced to descend on account of a faulty spark plug, but resumed flight and was in the air actually 1 hour, 6 minutes, 46.68 seconds, corresponding to an average speed of 55.83 miles per hour. His delay amounted to 59 minutes and 50 seconds, but this did not figure for penalization by the conditions of the race. Grahame-White made the 20 laps in 1 hour, 1 minute, and 4¾ seconds, or an average speed of 61 miles an hour.

This British aviator thus won the trophy, for the American team selected to defend the trophy met with several misfortunes and thus could not develop its full possibilities. As an elimination contest could not be held on account of the weather, three machines were selected to represent America. There were the tiny Wright racer of Walter Brookins, with a 60 horse-power 8-cylinder V-type motor, the Curtiss racer, with a 115 horse-power Chrysler 8-cylinder, V-type motor, of Charles K. Hamilton and a 50 horse-power Blériot monoplane of J. Armstrong Drexel. The Wright machine, which was expected to develop high speed and had passed the starting line at a rate of about 80 miles an hour, a few hundred yards beyond it dropped to the ground striking with terrific force, and damaging the machine severely, though Brookins escaped without injury. Drexel after seven laps in a wind of considerable velocity abandoned the race and Hamilton whose engine failed to work properly was unable to make a single complete circuit of the course. At the last moment John B. Moisant, one of the alternates on the American team, entered the race and reeled off the 20 laps in

1 hour, 57 minutes, 44.85 seconds elapse time making a single stop of about three quarters of an hour after the sixth lap. This gave America the second place, the only other competitor being Hubert Latham in a 100 horse-power 16-cylinder Antoinette monoplane. He was forced to descend after 15 laps, resuming in the afternoon his flight, which he completed successfully, the total elapsed time for the race being 5 hours, 47 minutes, 53.40 seconds.

**THE STATUE OF LIBERTY COMPETITION.** This contest was postponed from October 27th on account of weather conditions, and was held on October 30th with three contestants all in Blériot monoplanes; Grahame-White, Count de Lesseps and John B. Moisant, the first named having a 100 horse-power machine and the other contestants machines of 50 horse-power. The contest which carried with it a cash prize of \$10,000 offered by Thomas F. Ryan, was of interest, inasmuch as the path of the cross-country flight lay over the densely populated city and the East River and New York Bay with a sensational turn at the Statue of Liberty. Naturally the flights were made at a considerable height and the times of the three contestants were very close together, Grahame-White making the journey in 35 minutes 21.3 seconds; Count de Lesseps in 39 minutes 38.5 seconds, and Moisant in 34 minutes 38.5. There were no Wright machines in this competition.

**BELMONT PARK RECORDS.** At the Belmont Park meet a new height record—9714 feet—was made by Johnstone in a new small Wright biplane, while a monoplane record of 8373 feet was made by Drexel. During the week the various aviators were in the air endeavoring to secure records that would count in the aggregate for the totalization of duration and distance prizes. The winners of these contests were as follows:

#### TOTALIZATION OF DURATION

Aviator	Time	Prize
Hoxsey	7:29:21.85	\$3000
Johnstone	4:47:44.40	1500
Grahame-White	4:37:55.85	1000
Latham	4:11:21.20	500

#### TOTALIZATION OF DISTANCE

Aviator	Laps	Prize
Grahame-White	106	\$1500
Latham	103	1000
Aubrun	59	500

**LOS ANGELES AVIATION MEET OF DECEMBER, 1910.** The city of Los Angeles enjoyed the credit for the height records made at the beginning and at the end of the year 1910. On January 10th, we have seen how Louis Paulhan reached a height of 4164 feet in a Farman biplane, while Glenn Curtiss travelled aloft with a passenger at a rate of 55 miles an hour. The world's record for the year was made at the same city on December 26th when Arch Hoxsey in a standard Wright machine flew to a height of 11,474 feet. This record was made on the third day of the December meeting and Hoxsey was in the air for two hours. At this meeting the Antoinette monoplane record was broken by Hubert Latham, who flew for 2¼ hours. Previous to his public flights Latham had attempted duck-shooting from a monoplane and by

driving the ducks from the marsh out over the ocean he was able to bring down several. On December 28th there was a 5-lap race between the Curtiss machine driven by Ely and a Wright biplane driven by Parmalee in which the former won, making  $8\frac{3}{4}$  miles in 10 minutes 5 3-5 seconds. Radley, an English speed champion, on December 29th, using a Blériot machine, defeated Ely on his Curtiss, the former using a "baby" Wright. Radley's time was 9 minutes 13 1-5 seconds for a distance of  $8\frac{3}{4}$  miles. At this meet, Hoxsey made a cross-country flight to Mt. Wilson, circling the mountain at an altitude of 8200 feet. The closing days of the meeting were seriously marred by the death of Hoxsey in an accident.

**MICHELIN CUP.** The annual records of the competition for this important prize which is valued at about \$4000 and is awarded for the longest flight in a closed circle during the year offered most interesting evidence of the progress of aviation. This trophy was won in 1908 by Wilbur Wright who covered 78 miles in 2 1-3 hours. The following year Henri Farman, received the cup with a record of 126 miles in 4  $\frac{1}{4}$  hours. In 1910 the competition was comparatively keen and even up to the last day on December 31st, flights were made with the hope of winning this cherished trophy. Maurice Tabuteau with a Maurice Farman biplane in a series of prolonged distance flights during the year held the best record until December 21st, when it was taken from him by Legagneux with a flight of 320.62 miles in six hours and one minute in a Blériot monoplane. On December 30th, M. Tabuteau in a Farman biplane made a record of about 365 miles in seven hours, and this record stood at the end of the year and carried with it the Michelin Cup. On the last day of the year H. Farman endeavored to repeat his performance of 1909, but was unable to secure more than 309 miles in 7 hours. Nor was he the only aviator in the competition for this trophy on December 31st. Forty-two other attempts were made, and as showing the general interest in aviation it may be said that a hitherto unknown aviator, Marie, made his appearance and flew 331 miles. Breguet covered 205 miles and Sommer 109 miles.

**THE SCIENTIFIC AMERICAN TROPHY.** This first aeronautical trophy to be offered for competition in America was won for the third time by Glenn H. Curtiss and thus becomes his permanent property. His first leg on this trophy was gained in 1907 by a flight of slightly over a mile in his then new biplane. In 1909 the flight from Albany to Poughkeepsie of  $74\frac{1}{4}$  miles without a stop was the best achievement in competition for this cup.

**DEFOREST PRIZE.** The prize of \$20,000 offered by Baron DeForrest for the longest flight including the crossing of the English Channel made by an Englishman in an English-made machine was won by Thomas Sopwith, with a flight of 174 miles in a Howard-Wright biplane on December 18th. Leaving Sheppey Island he crossed the Channel to Dover and from Dover he went to Calais and landed on the Belgian frontier. While competing for this prize Grahame-White met with a bad accident on the same day, and Cecil Grace the only other competitor who started in the flight across the Channel, perished on his return trip. He was flying a Short-Wright biplane and left France on December 22nd with fuel for a five

hour trip. It was thought that he mistook the English cliffs for fog banks and steered away from shore and was lost in the North Sea.

**MICHELIN BRITISH PRIZE.** The Michelin British Empire prize of \$2500 for the longest flight by a British aviator and a British-made machine over a marked circuit was won by Capt. F. F. Cody of the British army balloon division. On December 31st he ascended at Farnborough and flew approximately 195 miles in 4 hours and 51 minutes. The best previous flight for the year was  $147\frac{1}{2}$  miles made on December 28th in a flight by A. Ogilvie in Sussex. Cody, it will be remembered, was a former American who became a British subject to supervise the balloon work of the British army, while Ogilvie was a member of the British team in the International Aviation Meet, at Belmont Park, where he operated a Wright biplane.

An interesting event was the trip of J. B. Moisant, an American, from Paris to London, carrying a passenger. The distance from Paris to Amiens was made in two hours on August 16, from Amiens to Calais in two hours and six minutes and the crossing of the Channel was made in 37 minutes. An unfortunate accident thirty miles from London prevented a complete journey to the British metropolis which was reached eventually on September 6th. The journey from Paris to Brussels, 180 miles, has also been made with a passenger, while Farman in his biplane carried two passengers on a 62 minute flight and Kinet carried one passenger on a flight of 2 hours and 20 minutes. A Sommer biplane made a trip with three passengers for a 5 minute flight and an H. Farman biplane was able to make a very short flight of two circuits of the course with six people on board. This passenger-carrying capacity indicated an increased use of the aeroplane for military reconnoitering and observation, as one or more observers are left free to photograph or otherwise record features of interest while the aviator himself controls the machine.

**CHAVEZ CROSSES THE ALPS.** The first crossing of the Alps by an aeroplane was made on September 23rd, by Georges Chavez, who on September 8th had made a word's altitude record at Issy-les-Moulineux, reaching a height of 8790 feet. He started from Brigue and flew towards the Simplon Culm passing to the right of the summit and crossing the Col de la Montscera whose height is about 8202 feet. Forty-two minutes after his departure he reached the Domodossala Valley, where the wings of his aeroplane broke and he fell to the ground meeting with an accident which forced him to retire to a hospital and ended fatally a few days later. Although the conditions of the competition which required a flight to Milan were not fulfilled, nevertheless this first passage of the Alps was attended with many sensational features due to the high winds and low temperatures which were experienced among the mountain peaks.

**FEMINA CUP.** The Femina Cup for the best record by a woman aviator was won by Mlle. Hélène Dutrieu with a record of  $103\frac{3}{4}$  miles in 2 hours, 35 minutes made on Dec. 21st with a Farman biplane. Jane Herven on December 31st attempted to win this cup but was only able to cover 90 miles in 2 hours. Mlle. Dutrieu, who had received a pilot's license in August, distinguished herself also by a trip with a pas-

senger from Ostend to Bruges and back in record time, a distance of 28 miles.

THE PATENT SITUATION IN AMERICA. Various legal complications involving the use of basic and other patents in connection with the aeroplane had taken place in the United States, and it was believed in some quarters that many difficulties would attend the bringing out of new types of machines by American manufacturers. Preliminary injunctions had been obtained by the Wright brothers against Curtiss and Paulhan and under these interlocutory decrees the Wright brothers were able to control flying in the United States for the several months they were in force. These injunctions were dissolved by the U. S. Circuit Court of Appeals and made possible the appearance in the United States of the various foreign aviators whose machines figured so prominently in the Belmont Park and subsequent meets.

ALTITUDE RECORDS. The following list of the principal height records of the present year taken from the *Scientific American* shows at a glance the rapid progress that was made in aeroplane climbing during 1910.

Aeroplane Altitude Records in 1910:

Dates.	Aviator.	Machine.	Country	Alt., Feet.
Jan. 7.	Latham.	Antoinette monoplane	France.	3,280
Jan. 12.	Paulhan.	Farman biplane....	U. S.	4,165
July 9.	Brookins.	Wright biplane....	U. S.	6,171
Aug. 11.	Drexel.	Blériot monoplane	Eng.	6,600
Sept. 3.	Morane.	Blériot monoplane	France.	8,471
Sept. 8.	Chavez.	Blériot monoplane	France.	8,485
Oct. 8.	Wynmalen.	Farman biplane....	France.	9,104
Oct. 31.	Johnstone.	Wright biplane....	U. S.	9,714
Nov. 23.	Drexel.	Blériot monoplane	U. S.	9,897
Dec. 9.	Legagneux.	Blériot monoplane	France.	10,499
Dec. 26.	Hoxsey.	Wright biplane....	U. S.	11,474

THE FATAL ACCIDENTS OF THE YEAR. While there was considerable progress in aviation during the year 1910 yet it was marked by an extraordinary list of fatalities which possessed more than usual significance in view of the fact that a number of the most skillful aviators lost their lives under conditions particularly distressing. In the list given below, which includes the names of more important air-men who were killed, will be found a number whose records and exploits have been discussed in previous paragraphs. At the end of the year which was marked by several serious fatalities the conclusion was general that lack of care in flying had been manifested by a number of aviators and that in the construction of machines a sufficient factor of safety had not been employed. Furthermore the demand of the spectators at the large aviation meets had been for sensational performances and many of the aviators, anxious to gain the applause of the crowds, had taken chances which prudence should not have permitted. The record below also tells of an increased number of fatalities caused by failure of the aeroplanes themselves. The breaking of various parts of machinery, or imperfect repairs, stopping of engines and other such misfortunes, were not infrequent and called for careful attention in future flights.

The following list gives the more important fatalities due to the accidents with aeroplanes during the year 1910:

January 4th, Léon Delagrangé met his death by a fall in a Blériot monoplane at Bordeaux.

April 2d, Hubert Le Blon was killed at San Sebastian, Spain, in a Blériot monoplane.

May 13th, Hauvette Michelin was killed at Lyons in an Antoinette machine. This accident occurred when the machine was on the ground, and was the result of a collision with a pylon.

June 17th, Eugene Speyer was killed in a glider towed by an automobile at San Francisco, Cal.

June 18th, Thaddeus Robl was killed at Stettin, Germany, in a Farman biplane.

July 3d, Charles Louis Wachter, a French aviator, was killed at Rheims in an Antoinette machine.

July 10th, Daniel Kinet, a Belgian aviator, dropped in a Farman machine from 300 feet at Ghent as the result of motor trouble. He died five days later.

July 12th, the Hon. C. S. Rolls was killed at Bournemouth, England, in a Wright biplane of French construction.

August 3d, Nicholas Kinet, Belgian, brother of Daniel, was flying 650 feet up when a rear wire in his Farman biplane became entangled in the motor mechanism, stopping the engine. The machine dropped.

August 20th, Lieutenant Marquis Vivaldi of the Italian Army, killed near Rome in a Farman biplane. In descending he lost control.

August 27th, Van Maasdyk, a Dutchman, was making a cross-country flight in a Sommer biplane when the motor stopped, causing the machine to turn turtle.

September 23d, Georges Chavez, Peruvian, after a flight over the Alps from Brigue, Switzerland, on a Blériot machine. He tried to make a landing within thirty miles of Milan. He was within thirty feet of the ground when the wind caught his aeroplane and dashed it to the ground. Chavez died September 27.

September 25th, Edmond Poillot, Frenchman, killed at Chartres, France, while flying with a passenger, who escaped with slight injuries. The machine was up 90 feet when a piece of canvas was ripped from one of the planes, causing it to overturn backwards.

September 28th, Plochmann, German, was in a machine that collapsed near Muhlhausen, Germany, at a height of 150 feet. He died the next day.

October 1st, Herr Haas, German, killed at Wellen, on the Moselle River, Germany, by a fall from his aeroplane. Cause unknown.

October 7th, Captain Mazlewitch, of the Russian Army, fell from a Farman biplane at St. Petersburg when up 1640 feet. Due to failure of motor.

October 23d, Captain Madolton, French Army, at Douai, France, was flying 100 feet up and tried to stop his engine, and plane fell to the ground. The engine refused to stop and the machine upset.

October 25th, Lieutenant Mente, German Army, killed near Magdeburg while planing to the ground in a Wright machine. It turned turtle and he was instantly killed.

October 26th, Fernando Blanchard, Frenchman, at Issy-les-Moulineaux, France, was preparing to land at the finish of a 140-mile flight from Bourges. He was going at great speed about 120 feet up when he lost control of his monoplane.

October 27th, Lieutenant Saglietti, Italian Army, was killed at Centosello, Italy. The aeroplane tipped and Saglietti was unable to right it.

November 17th, Ralph Johnstone was making a spiral glide in a Wright biplane at a height of 800 feet, at Denver, when the lower left plane of his machine broke and the machine passed from his control. Accident due to imperfect repairs of parts broken a few days previously.

December 3d, Lieutenant Cammarata, Italian Army, while flying with a soldier near Rome, in a Farman biplane, lost control of the machine, and it dropped. Both were killed.

December 22d, Cecil Grace perished at sea while flying on a return trip across the English Channel from France. He was flying a Wright biplane.

December 25th, D. Piccollo killed in an Antoinette machine at São Paulo, Brazil.

December 28th, Alexandre Laffont fell 200 feet on what was to have been the start of a flight to Brussels in company with M. Paula, who owned the machine. The latter was also killed.

December 30th, Lieutenant Caumont, French

Army Aviation Corps, while testing a new monoplane at Versailles, fell sixty feet and died soon afterward.

December 31, John B. Moisant, American aviator, winner of the Statue of Liberty Flight prize, killed near New Orleans, La., while trying for the Michelin prize, in a Blériot monoplane.

December 31st, Arch Hoxsey, the famous Wright aviator, killed at Los Angeles, Cal. After a flight to a height of 7142 feet and a descent to about 500 feet his machine was overturned and carried to the ground. Hoxsey was killed instantly.

**DEATH OF OCTAVE CHANUTE.** No record of the progress of aviation in 1910 is complete without mention of the death of Octave Chanute (q. v.), a biographical sketch of whom appears elsewhere in this volume. With that of Professor S. P. Langley Mr. Chanute's pioneer work for artificial flight in America will be held for many years in high appreciation.

### DIRIGIBLE BALLOONS

**THE WELLMAN AMERICA.** A notable event of the year was the attempted crossing of the Atlantic Ocean by Walter Wellman in a large dirigible balloon. Mr. Wellman previously had endeavored to reach the North Pole, leaving a base in Spitzbergen, and two attempts were made in a specially constructed and huge dirigible balloon. The airship used in the flights for 1910 was not the same as that which figured in his previous polar expeditions. The balloon was cigar shaped and contained six ballonets filled with air and fitted with valves. It was increased in size to an over-all length of 228 feet, with a diameter of 52 feet. It had a lifting capacity of 23,650 pounds and the leakage of the gas was reduced to a minimum by the form of its construction, two layers of silk being united with rubber to one of cotton. It was extremely flexible and to it was attached a long car made up of steel tubing in the form of a truss triangular in its cross section, and 156 feet in length. This gave rigidity to the balloon and afforded accommodation for machinery, stores, and crew. The bottom chord of the truss was a hollow cylindrical steel tank in which the gasoline was stored. Tubular extensions of this tank carried to the end of the truss completed its structure, while various stays and brackets stiffened the frame work, the car proper being enclosed in canvas. The motive power was provided by gasoline engines at the centre of the car, of 80 to 90 horse-power, while a smaller or donkey engine was used for a variety of purposes, such as cranking the main engines, and driving a blower to inflate the ballonets. Each shaft was connected by gearing with the propellers, the forward pair being 11 feet 8 inches in diameter, and the aft pair 10 feet 4 inches. The latter could be given an angular motion in a plane parallel with the car so that its direction up or down could be varied at will, thus obviating the necessity for stabilizing planes or sliding weights found in other dirigibles. Sleeping accommodations for the six men composing the crew were provided by hammocks, while below the car was suspended a life boat 27 feet in length and of 6 feet beam, which was well stocked with food, carried a mast and sail, and was to be the refuge for the crew in case of accident to the airship. There was a knife device to be used to rip open the balloon in case a sudden descent was necessary, while a quick releasing arrangement was fitted to the suspension of the boat. There was also a wireless telegraph ap-

paratus with current supplied from a storage battery charged from a dynamo driven by the donkey engine. The engines and propellers were designed to give a speed of 26 miles an hour with both engines working, or 20 miles with one in operation. Theoretically six days would be required to cross the ocean in a calm, but provision was made for a ten days' trip with five tons of gasoline. The forward engine was designed to burn hydrogen as well as gasoline by having a special hydrogen carburetor and as the hydrogen was drawn from the ballonets its place was taken by air forced in from the blower. Suspended from the centre of the car was the equilibrator supported by cables fore and aft. This novel device 330 feet in length took the place of the drag rope of the dirigible balloon, and consisted of 30 steel tanks strung together on a cable. These tanks carried gasoline and as they were exhausted relieved the balloon of weight and compensated for loss of gas. Furthermore the equilibrator dragged in the water, the aim being to keep the airship about 200 feet above sea level. In designing the craft there was associated with Mr. Wellman, Melvin Vaniman, as chief engineer, a man who had had considerable experience in the construction of airships and aeroplanes.

**VOYAGE OF THE AMERICA.** This wonderful airship was assembled at Atlantic City, N. J., but was never tested before its first and final cruise. Considerable scepticism was expressed as to whether any real flight would ever be made, and the unsuccessful polar expeditions were recalled by many whose faith in the proposed trip was very doubtful. But on October 15, at daybreak, in almost dead calm and fog, everything was finally rigged and at 8 o'clock the huge craft drifted out to sea. At first satisfactory progress was made, but after about four hours the after-engine failed. The pounding action had worked the bevel-gearing loose. Up to 4 P. M. on Sunday the second day the course was maintained, though the ship strained and the equilibrator, dragging and pounding on the water, interfered with the motion of the airship. About 9 o'clock in the evening a fierce northeast wind struck the ship and gasoline and other supplies as well as the useless engine were cast loose on account of the cold shrinking the balloon which otherwise would have been dragged down to the water. Then under the hot sun of the following day the gas expanded and the balloon was carried up to a height of about 3000 feet and then again as the gas was permitted to escape the balloon sank rapidly. The wind was carrying the balloon in a southerly direction somewhat to the east and it was hoped that the Azores Islands could be made, but a subsequent shift in the wind made this impossible and it was also necessary to jettison more gasoline.

By Tuesday it was realized that any continuation of the voyage would be as foolish as barren of results, and when the steamer *Trent* hove in sight early in the morning when it was still dark, it was determined to abandon the airship. It hardly could have been kept in the air for more than another day, while the problem of launching the life boat and remaining in it until rescued was indeed serious. However, while the *Trent* stood by, the crew stored their records and the material they could save on the life boat and cut loose from the airship on which the valves were opened so as to permit the escape of

gas and prevent the balloon from becoming a menace to navigation. The men from the airship were taken aboard the steamship and the *America* settled nose down in the water soon to disappear. This voyage, though unsuccessful as a transatlantic trip, was, however, in many ways remarkable. A record of 71½ hours in the air was made for a dirigible balloon as against 36 hours for Zeppelin and a total distance of 1008 miles without coming to earth was recorded in the log book as against 800 by Zeppelin. The one significant failure was the failure of the after motor, but otherwise the structure and machinery proved satisfactory, and the chief engineer, Mr. Vaniman, was confident that the ocean crossing could be made by such a dirigible.

**ZEPPELIN AIRSHIPS.** An accident to the Zeppelin type of airship occurred on April 25th when the huge dirigible Zeppelin II was torn from its anchor in a storm and carried away in a northwesterly direction. An attempt had been made by two companies of soldiers to hold the vessel against the force of the storm but in order to prevent a serious accident the soldiers were ordered to release the anchoring cables and the balloon was driven into the Lahn valley where it was caught broadside by a violent gust and brought down to the earth, being completely wrecked in the telegraph wires and poles along the railway. This airship, since 1909, had been used by the aeronautic division of the German army and had participated in the manoeuvres of that year. It had a volume of 15,000 cubic metres, a length of 136 metres and a maximum diameter of 13 metres. It was capable of a speed of 28 miles an hour and could carry passengers and supplies aggregating 8800 pounds. It weighed in all about 23,100 pounds and the balloon proper was made up of 17 gas cells.

The various dirigible balloons designed and constructed by Count Zeppelin reached what was believed to be a high state of perfection in the Zeppelin VII or *Deutschland*, which commenced a series of what were intended to be regular trips carrying passengers. An important trip was made on June 2, between Friedrichshafen and Düsseldorf, 311 miles, and the nine hour journey was made at the rate of 33½ miles per hour. Several trips were made with as many as 20 passengers in addition to a crew of 12, and the enterprise seemed on a successful basis when a few weeks later the *Deutschland* was caught in a storm and driven into a forest where the great balloon was destroyed on June 28th. The Zeppelin VI was destroyed by fire caused by an explosion on September 14th. This airship also had done a considerable passenger carrying business.

**THE WILLOWS DIRIGIBLE.** An English dirigible balloon was designed and operated by E. T. Willows of Cardiff and made some trips during the latter part of the year. The first journey of importance was from Cardiff to London, a distance of 139 miles, and on November 4th a trip across the Channel to Paris was attempted, leaving its hangar at Wormwood Scrubbs, West London. On November 4th, after circling the Nelson Monument in Trafalgar Square, Willows laid a course to the south of England coasts, following the railway line and then crossed the Channel, intending to make a complete journey to Paris. Unfortunately he lost his bearings and was forced to descend at Douai on account of a severe gale. Willows's balloon, which was named the "City of Cardiff,"

was of fish shape and measured 83 feet in length by 22 feet maximum diameter, with a capacity of 20,000 cubic feet. This airship, all things considered, worked very successfully and with better weather conditions it could readily have made the trip from London to Paris.

**CLEMENT-BAYARD II.** Another important flight was that of the Clement-Bayard II, a British dirigible which made a successful trip from Paris to London on October 16th, accomplishing the journey without a stop in a little over 6 hours. This ship was subsequently purchased by the British War Office.

#### NON-DIRIGIBLE BALLOONS

**GORDON-BENNETT CUP RACE.** The 1910 competition for the Gordon-Bennett International Balloon Trophy was held at St. Louis and resulted in one of the most successful events of this kind ever held, and one in which the world's record was all but broken. This competition is for non-dirigible balloons without mechanical motors, and the skill of the aeronauts is employed mainly in attaining levels where the most favorable air currents prevail. The race was started from St. Louis, Mo., on October 17, 1910, there being ten contestants as listed below. The winning balloon was *America II*, Allan R. Hawley, pilot, and Augustus Post aid, and its trip was one of the most thrilling in the history of aeronautics, the final descent being made in Canada many miles from civilization. For nine days the world at large was without tidings of these adventurous aeronauts and it was believed that they had met with disaster, but eventually after being in the air about 40 hours they landed in the township of Lake du Banc de Sable in Quebec and slowly made their way to civilization. The start of the trip was made at 5:46 P. M. on October 17, 1910, from St. Louis and a course in general northerly and north by east was maintained across Missouri, Illinois, Wisconsin, Lake Michigan, Michigan, Lake Huron, the great Canadian Wilderness, and into Quebec as far as Lake St. Johns where it was deemed essential to begin a descent towards the earth. This long trip was made possible by the great buoyancy of the balloon which was able to rise to a height of from 14,000 to 16,000 feet during its journey over the province of Quebec, and six bags of ballast remained at the end of the trip which easily could have been prolonged across the uninhabited wilds of Labrador to the Atlantic Ocean. The decision to land was followed by a descent at 3:45 on October 19th half a mile from a small lake called Sand Bank Lake, four miles north of Lake Tchoyagama. The balloon was duly packed and then a journey over cliff and boulder to Lake Tchoyagama was undertaken and then to a trapper's camp on the River Blanche where food was obtained and the services of two trappers secured to lead the aeronauts to civilization. These experiences were most extraordinary and the news of their safe arrival in civilization was received with unusual interest. The performance of the German balloon, *Düsseldorf II*, was also good and secured for it second place, but the experiences of the pilot and aid were far less exciting.

**BENNETT CUP SUMMARY.** The following summary gives the names of the participating balloons together with the distances accomplished as corrected by the U. S. War Department, and other information:

*America II* (America)—Allan R. Hawley, pilot; Augustus Post, aid; landed at Lake

Tchotagama, near Peribonka, Que., distance 1171½ miles.

Düsseldorf II (Germany)—Lieut. Hans Gericke, pilot; S. F. Perkins, aid; landed at Kiskisink, Que., distance 1131 miles.

Germania (Germany)—Capt. Hugo von Abercron, pilot; Augustus Blanckertz, aid; landed at Cocococache, Que., distance 1079 miles.

Helvetia (Switzerland)—Col. Theodore Schaeck, pilot; A. Armbruster, aid; landed at Ville Marie, Que., distance 826 miles.

Hamburg III (Germany)—Lieut. Vogt, pilot; W. F. Assman, aid; landed in Lake Nipissing, Ont., distance 756 miles.

Azurea (Switzerland)—Capt. Emil Messner, pilot; Léon Giraudan, aid; landed near Biscota.

Isle de France (French)—Alfred Leblanc, pilot; Walther de Mumm, aid; landed at Pogamasing, Ont., distance 722 miles.

St. Louis No. 4 (America)—H. F. Honeywell, pilot; J. W. Tolland, aid; landed at Hillman, Mich., distance 552 miles.

Conдор (France)—Jacques Faure, pilot; E. G. Schmolek, aid; landed at Two Rivers, Wis., distance 413 miles.

Million Population Club (America)—S. Louis Von Phul, pilot; J. M. O'Reilly, aid; landed near Racine, Wis., distance 317 miles.

**PROTESTS.** At first it was announced that Messrs. Hawley and Post had made a distance of 1355 miles, thus exceeding that of the record trip of Count de Vaulx made in a flight from Paris to Russia in 1900, when 1193 miles was accomplished. As shown above, this is greater than the corrected distance of 1171½ miles of the America II and in 1910 still stood as the record. The Lower Rhine Aeronautic Society protested the award of the cup to Hawley on the ground that his name had not been advertised two months before the race in accordance with the rules of the American Aero Club.

Dirigible balloons had their share of fatalities during the year. Oscar Erbsloeh, one of the most practiced balloonists in Germany, who was the winner of the Gordon Bennett race in 1907, held in the United States and starting at St. Louis, was killed near Aipladen, Germany, with four companions on July 13th, 1910. He had ascended in the dirigible airship of the non-rigid type built by himself and was the victim of an explosion in the air, the cause of which was never ascertained. The airship was 176 feet in length and 33 feet in diameter, being driven by 125 horse power motors capable of propelling the machine at the speed of 28¼ miles an hour.

For the military uses and progress with aeroplanes and dirigible balloons, see paragraphs under **MILITARY PROGRESS**.

See also **NAVAL PROGRESS**.

**AFGHANISTAN.** A central Asian monarchy with an area of about 225,000 square miles. The population (estimated at 5,000,000) is made up of the Durranis (the dominant race), the Ghilzais (the most numerous), the Tajiks, Hazaras, Aimaks, and Uzbaks. Kabul (the capital) has about 70,000 inhabitants; Herat, 45,000; Kandahar, 35,000. Steps have been taken to develop education, thus far controlled by the mullahs. The people are industrious and prosperous, engaging mainly in agriculture and stock raising. Wheat (the staple food), barley, lentils, rice, millet, corn, and *dal* are grown; sheep and transport animals are raised. The mineral products are salt, copper,

coal, iron, lead, rubies, and gold; manufactures, silk, woolen and hair cloth, and carpets. The trade with India (1909-10) amounted to over £2,261,000; with Russia, imports were valued at 4,000,000 roubles, exports at about the same amount. Russia gives bounties and rebates. The Afghan government levies heavy customs duties. No figures exist for the annual revenues, which consist largely of payments in kind. The Sind-Pishin railway terminates at Chaman, on the frontier, 65 miles from Kandahar. Afghanistan, the "buffer state," sustains foreign relations with the British-Indian government alone (from which government it receives a subsidy of £120,000 yearly; commercial relations with India and Russia. It is in all other respects an independent despotism, the ameer (1910, Habib Ullah Khan, son of Abdur Rahman Khan, deceased October 3, 1901), being absolute ruler. A native British agent resides at Kabul.

**ARMY.** The regular army maintained by conscription and estimated at about 50,000 men or by other critics at between 60,000 and 70,000, is armed with different types of weapons, the state possessing it is said enough rifles to arm an army of 100,000. In addition to the regular army in which there are about 9000 cavalry and a considerable number of artillery, there are local levies of horse and foot, the former being simply the retainers of various tribal chiefs, while the foot troops are organized as auxiliary to the regular infantry. There are organizations of field and mountain artillery, 360 guns being possessed by the army in addition to 30 mountain guns and howitzers which were brought into the country from the Krupp works in Essen. It is believed that arms and munitions of war in considerable amounts have been smuggled into the country through Persia. There are maintained at Kabul efficient ordnance works and arsenals under European superintendence and these are engaged in the manufacture of cannon, rifles, and ammunition. The weak point of the army is the officers, few of whom are competent to train or lead troops in serious operations.

**AGASSIZ, ALEXANDER.** An American scientist, died March 29, 1910. He was born in 1835 in the town of Neuchatel, in Switzerland. His father was the famous naturalist and scientist, Jean Louis Agassiz, while his mother was Cecile Braun, sister of Alexander Braun, the eminent botanist and philosopher. He received his early education in Europe and came to the United States when he was fifteen years old. He entered Harvard College and graduated in 1855. Selecting civil engineering for a profession he entered the Lawrence Scientific School of Harvard College, where he graduated in 1857. In 1859 he went to the State of California where he was appointed an assistant on the United States Coast Survey. He utilized his ability with brush and pencil at this time in drawing specimens of the fishes caught along the boundary. He also began to select specimens for

his father and showed himself an adept in their study and preservation. In the winter of 1859-60 he went to Panama and Acapulco, collecting specimens for the Museum of Comparative Zoölogy of Harvard College. Returning to San Francisco he resumed the study and drawing of fish and then turned his attention to examining the principal mines in the interior of the State. He returned to Cambridge in 1860 and took a full course in zoölogy and geology in the Lawrence Scientific School. During the absence of his father in Brazil in 1865, Agassiz had entire charge of the Museum founded by the former. In the following year he became interested in copper mining and went to the Lake Superior region. He there became treasurer of the Calumet Mining Company and later was engaged in the development of the neighboring property of Hecla. In 1867 he became the superintendent of the combined properties. He returned to Boston in 1869 as president of the Calumet and Hecla Mining Company. These mines were extremely profitable and from them Agassiz made a large fortune. In 1869 he went abroad to study in the museums and examine the collections of Europe. On the death of his father in 1874 he became the curator of the Museum of Comparative Zoölogy. He was familiar with the vast plans of his father and continued to develop them. His work became known and admired by scientists throughout the world. In 1875 he went to the west coast of South America where he examined the copper mines of Peru and Chile and surveyed Lake Titicaca. From this expedition he brought back for the Peabody Museum of Cambridge an immense collection of Peruvian antiquities. In 1875 he was invited by Sir Wyville Thompson to assist in making up the collection of the English exploring expedition of the ship *Challenger*. He brought to Cambridge a portion of these collections and there read his celebrated report on the sea urchins. He had previously gained the Walker prize of \$1,000 from the Boston Society of Natural History for investigations of the echinoderms. In 1873 he had received the "Prix Serres," awarded only once in ten years by the Académie des Sciences of Paris. He was the first foreigner to gain this distinction. From 1876 to 1881 he spent the winters in deep sea dredging on the steamship *Blake* which had been placed at his disposal by the superintendent of the Coast Survey. He explored the deep waters of the Gulf of Mexico and of the Caribbean Sea. His ingenuity and special familiarity with hoisting and mining machinery had much to do with the success of this expedition. In 1904 he made an expedition to take deep sea soundings in the Pacific off the coast of southern and Lower California and the Central and South American states. The expenses of this expedition, which amounted to \$75,000, were paid by him after he had refused an offer from Andrew Carnegie to provide the funds. This expedition was known as "the Agassiz scientific cruise." During all these years Professor Agassiz had remained the president of the Calumet and Hecla Mining Company and from the large sums received from this property he contributed liberally to the Museum of Comparative Zoölogy and other scientific bodies. He was awarded a membership in the Order of Merit by the German Emperor in 1902 and in 1896 was made an officer of the French Legion of Honor. He was also a foreign member of the Academies of

Science of Paris, London, Vienna, Stockholm, Rome, Munich, and Copenhagen. Among his published works are the following: *Seaside Studies in Natural History* (with Mrs. Elizabeth Cabot Agassiz) (1865); *Marine Animals of Massachusetts Bay* (1871); *Explorations of Lake Titicaca; Three Cruises of the Blake; Revision of the Echini; Coral Reefs of Florida, the Bahamas, the Bermudas, the West Indies, of the Pacific, of the Maldives; Panamic Deep Sea Echini; Hawaiian Echini; Embryological Memoirs on Fishes, Worms, Echinoderms, etc.*

**AGNEW, Sir WILLIAM.** An English publisher, died October 31, 1910. He was born at Manchester in 1825 and was educated privately in that city. His father, Thomas Agnew, was a publisher with large establishments in Manchester, London, and Liverpool. William Agnew entered the firm early in life and eventually became senior partner, a post which he held for many years. The firm name was Bradbury, Agnew & Company. This firm is the proprietor and publisher of *Punch*, the English humorous weekly. Sir William was long a friend and supporter of Gladstone, and in 1880 he was elected to Parliament as a Liberal from a Lancaster division. He was re-elected five years later, but retired from politics after a defeat in 1892. He was a prominent figure in the publishing and art world. In 1887 he was chairman of the art committee of the Manchester Exposition, was a member of the Royal Commission for the Melbourne Centenary Exposition and the Paris Exposition of 1892. He printed a volume of essays, addresses and travel notes, which had a private circulation.

**AGRICULTURAL BANK.** See PHILIPPINE ISLANDS.

**AGRICULTURAL EDUCATION.** During 1910 agricultural education was actively promoted in nearly all parts of the world. This was accomplished through conventions and congresses for the discussion of ways and means, through the establishment of new institutions, and through the better financial support and larger attendance of students at existing agricultural colleges and schools. The International Scientific Congress at Buenos Ayres, the Third International Congress for Home Education at Brussels, the National Education Association at Boston, the Dry-farming Congress at Spokane, the Second National Conservation Congress at St. Paul, and numerous other scientific and educational conventions held during the year devoted much attention to the problems of educating people for life on the farm.

**FOREIGN COUNTRIES.** Among European countries France established an agricultural institute at the University of Toulouse, Ireland reported an increase in the number of itinerant instructors in agriculture and a larger attendance of students at winter and summer short courses in agriculture and domestic economy, and England opened a new \$100,000 agricultural building at Cambridge University, and established at Horsted Keynes a colonial training farm for young men wishing to go to the colonies. The conditions relating to agricultural education and research in England were improved in two ways: (1) By clearly defining the relations between the Board of Agriculture and Fisheries and the Board of Education with reference to the promotion of agricultural education, whereby the former will deal with institutions giving advanced courses in agriculture and those re-

stricted to one special phase of the subject, such as forestry, dairying, cider making, etc., the main purpose of which is to prepare competent instructors in that phase of agricultural work, and the latter will deal with all other forms of agricultural education; and (2) by the enactment of the Development and Road Improvement Funds Act of 1909, which provides, among other things, for "aiding and developing agriculture and rural industries by promoting scientific research, instruction, and experiments in the science, methods, and practice of agriculture." See AGRICULTURE. In Wales the first poultry demonstration train in Great Britain was run over the railroads for 8 days and was generally received with popular favor.

In Australia the University of Melbourne inaugurated a course in agriculture and elected a dean of the agricultural faculty. The boys in the reformatory—14 to 18 years—were given a course in viticulture and general agriculture, along with other work in general educational lines, at the Rutherglen Agricultural College. Brazil organized a bureau of agricultural inspection to make a special study of agricultural conditions, collect and disseminate useful information among farmers, promote crop introduction and production, compile agricultural statistics, make crop estimates, and inspect agricultural schools and experiment stations. (See AGRICULTURE). In the Canadian Provinces, Alberta began developing a university at Strathcona, which is to include a college of agriculture and a department of extension teaching, and will establish a system of secondary agricultural schools in connection with demonstration farms in those sections of the province not coming within the immediate scope of the college itself. The Nova Scotia Agricultural College, at Truro, reported increased attendance at regular and special courses and established a summer school for teachers. The Cuban budget for 1910 included \$112,200 for the maintenance of the six agricultural schools authorized for the several provinces by an act passed July 12, 1909.

In Italy a monthly journal, *Bollettino delle Re. Cattedre Ambulanti d'Agricoltura della Sardegna*, was published as the organ of the traveling schools of agriculture. The Madras Agricultural College, at Coimbatore (India) was dedicated and 20 students were admitted in June. The college has a farm of 450 acres. In Santo Domingo a general board of agriculture and immigration was established to have charge of all schools of agriculture, experiment stations (in contemplation), and the dissemination of agricultural literature.

UNITED STATES OFFICE OF EXPERIMENT STATIONS. In its capacity as a clearing house for agricultural education in the United States, the Office of Experiment Stations published statistical and other information concerning colleges and schools of agriculture, extension teaching and farmers' institutes, and also prepared and published a number of circulars and bulletins of a pedagogical nature. According to one of the statistical publications, the number of institutions in the United States giving instruction in agriculture increased from 545 in October, 1908, to 875 in May, 1910, a gain of 330 institutions (60 per cent) in 19 months. Its publications of an educational character included bulletins on Consolidated Rural Schools and Organization of a County System, and College Extension in

Agriculture; Farmers' Bulletins on Boys' and Girls' Agricultural Clubs, School Exercises in Plant Production, School Exercises on Corn, Forest Nurseries for Schools; a syllabus of an Illustrated Lecture on Wheat Culture; and circulars on the Free Publications of the Department of Agriculture Classified for the Use of Teachers, How to Test Seed Corn in School, Institutions in the United States Giving Instruction in Agriculture, Progress in Agricultural Education Extension, Farmers' Institutes for Young People, and Agriculture as First Year Science.

THE GRADUATE SCHOOL OF AGRICULTURE. The fourth session of the Graduate School of Agriculture was held under the auspices of the Association of American Agricultural Colleges and Experiment Stations at the Iowa State College, Ames, Iowa, during July. The enrollment was larger than at any previous session and the interest manifested by the students has never been surpassed. There were 207 students from 39 States and the District of Columbia and 6 foreign countries. Eight general lines of instruction were given and important conferences on agricultural extension, agricultural journalism, and elementary and secondary instruction in agriculture were held. The faculty numbered 57, in addition to 17 speakers at special conferences. The international relations of the school were brought out by the very interesting and valuable lectures given by Dr. E. von Tschermak, professor of plant breeding in the Royal Imperial College of Agriculture of Vienna, Austria; Dr. J. C. Ewart, professor of natural history at the University of Edinburgh, Scotland; and Prof. G. E. Day, professor of animal husbandry at the Ontario Agricultural College, Guelph, Canada.

AGRICULTURAL COLLEGES. Steps were taken by the Association of American Agricultural Colleges and Experiment Stations to celebrate in 1912 the fiftieth anniversary of the establishment of the United States Department of Agriculture and of the passage of the first Morrill Act for the endowment of State agricultural colleges, and the twenty-fifth anniversary of the passage of the Hatch Act for the establishment of State agricultural experiment stations, by holding in the city of Washington an international congress of agricultural education. A college of agriculture was opened June 14 at Los Banos, as a department of the University of the Philippines. At the Michigan Agricultural College a veterinary college was established. The agricultural colleges had a successful year, with a large attendance of students, and the reports concerning enrollment at the opening of the new year in the fall of 1910 showed some remarkable examples of growth in the number of agricultural students. Arkansas reported an increase of 13 per cent., Kentucky 50 per cent., Massachusetts 25 per cent., North Dakota 25 per cent., Minnesota over 42 per cent., and Wisconsin 60 per cent. At the University of Illinois there were 100 more agricultural freshmen than last year, at the Ohio State University more than ever before (over 300 freshmen), and at Cornell the agricultural students had increased from 932 to 1254.

There was a notable increase in the number of institutions conducting teacher-training courses in agriculture. The total number of such institutions was 214, including 30 agricultural colleges, 156 State and county normal schools and 28 negro schools. Nineteen of the agricultural

colleges announced regular courses for teachers and 24 of them conducted summer schools for teachers of agriculture. In Michigan the teachers of agriculture in high schools organized the Society for the Promotion of Agricultural Education in the Public Schools.

**EDUCATIONAL EXTENSION WORK IN AGRICULTURE.** Farmers' institutes were maintained in every State, with responsible directors in charge and a corps of teachers aggregating over 1000 specialists to give instruction. There was appropriated for carrying on the work about \$432,000, an increase of \$86,000 over the appropriation of the year before. There were held 5651 regular institute meetings, composed of 16,586 sessions of one-half day each, with a total attendance of 2,395,908. In addition, 99 movable schools of agriculture were held last year, with an attendance of 65,977. There were also many field demonstrations, and 28 agricultural demonstration trains were run over many thousands of miles in 18 different States, which were visited by about 190,000 people. Fifteen States held 444 institutes for women, with an attendance of 4850; and there were 160 sessions of institutes held for young people.

**SECONDARY AND ELEMENTARY SCHOOLS.** In 1910 there were 630 secondary institutions—agricultural high schools and public and private high schools and academies—with students in agriculture. The most notable advance in secondary agricultural education was in the number of departments of agricultural instruction established in public high schools with the aid of State appropriations. Five such departments were established in Alabama high schools, 8 in Louisiana, 10 in Minnesota, 5 in Mississippi, and 10 in Virginia. In Maryland and New York new high school laws providing for State aid to encourage the establishment of courses in agricultural home economics and manual training in public high schools were passed.

The boys' and girls' agricultural club movement made rapid progress. In the 11 Southern States in which boys' corn clubs were conducted in coöperation with the United States Department of Agriculture, over 46,000 boys grew one acre of corn each, and to the 11 State winners a free trip was given to Washington. The winner of the sweepstakes prize grew on one acre 228 bushels and 3 pecks of corn at a cost of 43 cents a bushel. Similar contests in growing farm crops or in cooking and sewing were also conducted in nearly all of the States of the North and West. In Kansas an organization known as Rural Life Boy Scouts was started.

The first State fair agricultural school encampments were held in Illinois and Oklahoma. Large tents were erected and in them the boys (150 in Oklahoma) slept, ate, and listened to lectures for several days. Educational farm encampments were held in a number of States.

**TEXT-BOOKS AND MANUALS.** A large number of text-books and manuals suitable for use in agricultural courses in colleges and technical agricultural high schools were published in 1909 and 1910. Among the more strictly agricultural of these text-books are the following: W. M. Hays, *Farm Development* (1910); T. L. Lyon and E. O. Fippin, *The Principles of Soil Management* (1909); H. G. Lamb, *Farm Bookkeeping* (1909); P. McConnell, *Live Stock: Breeding and Management*; W. Macdonald, *Dry Farming: Its Principles and Practice* (1909); J. McLennan, *A Manual of Prac-*

*tical Farming* (1910); T. Shaw, *The Management and Feeding of Cattle* (1909); V. M. Shoesmith, *The Study of Corn* (1910); C. Werner, *A Textbook on Tobacco* (1909); A. R. Whitson and H. L. Walster, *Notes on Soils* (1909); J. E. Wing, *Alfalfa in America* (1909).

There were also numerous books relating to poultry husbandry, of which the following are the more important: E. Kellerstrass, *The Kellerstrass Way of Raising Poultry* (1909); H. H. Lehman, *Lehman's Poultry Doctor*, (1910); F. R. Lillie, *The Development of the Chick* (1908); A. T. Johnson, *Chickens and How to Raise Them* (1909); H. A. Nourse, *et al., Turkeys, Ducks, and Geese* (1909); M. Purvis, *Poultry Breeding* (1910); C. S. Valentine, *How to Keep Hens for Profit* (1910).

Among the books on horticulture and forestry the following are worthy of mention: A. C. Apgar, *Ornamental Shrubs of the United States*, (1910); B. E. Fernow, *The Care of Trees in Lawn, Street and Park, with a List of Trees and Shrubs for Decorative Uses* (1910); B. E. Fernow, *History of Forestry* (1909); A. Fron, *Silviculture* (1909); M. G. Kains, *Making Horticulture Pay* (1909); T. V. Munson, *Foundations of American Grape Culture* (1909); Julia E. Rogers, *Trees Every Child Should Know* (1909); W. S. Rogers, *Garden Planning* (London and Leipzig, 1910); A. C. Van Velsor, *Fig Culture* (1909).

In addition to these there were the following, closely related to agriculture: I. W. Brewer, *Rural Hygiene* (1909); C. W. Burkett, *The Farmer's Veterinarian* (1909); W. S. Hall, *Nutrition and Dietetics* (1910); F. Löhnis, *Handbook of Agricultural Bacteriology* (*Handbuch der landwirtschaftlichen Bakteriologie*) (Berlin, 1910); H. L. Russell and E. G. Hastings, *Agricultural Bacteriology* (1909).

In the field of secondary and elementary instruction in agriculture there were two books discussing pedagogical problems: David Sneed, *The Problem of Vocational Education*, (1910); and H. W. Focht, *The American Rural School: Its Characteristics and Its Future* (1910). There was also a large number of elementary text-books of agriculture, nature study, and gardening, of which the following are the more important: D. O. Barto, *Manual of Agriculture* (1910); Lottie E. Cray, *Field Zoölogy* (1910); P. Elford and S. Heaton, *Practical School Gardening* (1909); Lillian C. Flint, *Small Gardens for Small Gardeners* (1910); F. M. Fultz, *The Fly-aways and Other Seed Travelers* (1909); M. Louise Greene, *Among School Gardens* (1910); Myrta M. Higgins, *Little Gardens for Boys and Girls* (1910); Sarah W. Landes, *Elementary Domestic Science* (1909); H. G. Parsons, *Children's Gardens for Pleasure, Health, and Education* (1910); S. C. Schmucker, *The Study of Nature* (1909); H. E. Stockbridge, *Land Teaching* (1910); A. A. Upham, *An Introduction to Agriculture* (1910); C. M. Weed, *Farm Friends and Farm Foes* (1910); A. D. and E. W. Wilson, *Agriculture for Young Folks* (1910).

**AGRICULTURAL EXPERIMENT STATIONS.** EXTENSION OF THE WORK. Public interest in broadening the work and influence of the agricultural experiment stations is still growing. This is shown by the attention given to agricultural experimentation in the public

press and popular magazines, by the efforts railroads are making to disseminate the results obtained by the stations, by the establishment of local experimental agencies, as well as by the larger State appropriations for station buildings, equipment and maintenance. In California a substation for irrigation has been established in the Imperial Valley. In Louisiana a special station for rice culture is now in operation. In Minnesota 12 demonstration farms of 80 acres each have been established and 7 more are planned. The State Federation of Commercial Clubs is actively coöperating in this enterprise. Nine additional demonstration farms have been opened in North Dakota and nine substations have been located in Texas. Substations or experimental farms have also been established recently in Nebraska, Nevada, Tennessee, Maine and Oregon. The establishment of fellowships by business firms for the investigation of special problems is another new evidence of the interest in agricultural investigations. An example of this is the fellowship at Cornell University Station for investigating the value of commercial lime-sulphur mixtures as fungicides. In 1909 the stations employed 1242 persons in the work of administration and inquiry. They published 517 annual reports, bulletins and circulars, which were supplied to over 912,000 addresses on the regular mailing lists. The volume of station correspondence with farmers is enormous. The value of the additions to station equipment in 1909 aggregated \$744,561. Substantial buildings to be used exclusively by the stations have been erected in Florida, Indiana, Porto Rico and Texas.

**FEDERAL AND STATE STATIONS.** Agricultural experiment stations maintained in whole or in part by Federal funds now exist in every State and Territory, including Alaska, Hawaii, Porto Rico and Guam. The total amount expended for stations maintained under the acts of 1887 and 1906 during the fiscal year ending June 30, 1909, was \$3,053,446.90, of which \$1,248,000 was received from the national government. In addition to this, the Office of Experiment Stations had an appropriation of \$314,620 for the past fiscal year, including \$26,000 each for the Alaska, Hawaii and Porto Rico experiment stations, \$5000 for the Guam Experiment Station, \$7000 for nutrition investigations, \$150,000 for irrigation and drainage investigations, and \$10,000 for farmers' institutes and agricultural schools. In Alabama, Connecticut, Hawaii, Louisiana, Missouri, New Jersey, New York, North Carolina and Virginia separate stations are maintained wholly or in part by State funds, and in a number of States substations are maintained. Excluding substations, the total number of stations in the United States is 62, of which 55 receive Federal funds.

**EFFECTS OF THE ADAMS ACT.** During the present fiscal year the Federal appropriation under the Adams Act reaches its maximum of \$15,000 to each State and Territory, or \$720,000. The same amount is granted to the stations under the Hatch Act, making a total Federal appropriation of \$1,440,000. In a report to the House Committee on Agriculture, the director of the Office of Experiment Stations makes the following statement regarding the effect of the Adams Act:

"There is no doubt that the Adams Act has raised the general level of the experimental

work of the American stations; it has also led the States to greatly extend their more practical operations. Agricultural science will grow chiefly through numerous small contributions to knowledge, and of these a relatively large number have been gained by our stations during the past few years. Some fundamental and far-reaching results have also already been obtained with the aid of the Adams fund. These may be illustrated by the following: The Maine Station has shown high egg production is a family quality and inherited only within families having the ability to transmit it. On this basis a satisfactory method of selection has been worked out. The same thing has been found true of corn. High quality in some respect in the individual plant may not be transmitted, but such transmission occurs within certain families. A new standard for feeding dairy cows has been worked out by Professor Haecker of Minnesota, which is more practical and economical under American conditions than the German standards. It has been definitely shown by Dr. Lipman of New Jersey that such crops as corn, oats, etc., profit by the ability of legumes to assimilate the free nitrogen of the air. How this interchange of material takes place is being studied."

**FACILITIES FOR RECORD AND REVIEW.** The Association of American Agricultural Colleges and Experiment Stations is continuing its efforts to secure the establishment of a journal of agricultural research in which the original reports of the scientific work of the stations may be published, and the Secretary of Agriculture has recommended this in his estimates for the appropriations for his Department for the ensuing fiscal year. The Office of Experiment Stations has enlarged its review of the world's literature of agricultural science in the *Experiment Station Record*. Two volumes of this journal are now issued annually, those for the past year including over 7000 abstracts. The 22 volumes thus far issued contain references to 78,698 articles, besides editorials, special articles and notes. The card index of the literature of the American stations issued by this office now contains 31,000 cards and is being widely used by students. Copies of this index are deposited in all the libraries of the agricultural colleges, experiment stations and State departments of agriculture. The office has become one of the large investigating bureaus of the Department of Agriculture, its annual income for this purpose aggregating over \$250,000. Its investigations are conducted in five main lines: (1) maintenance of experiment stations in Alaska, Hawaii, Porto Rico and Guam, (2) agricultural education (q. v.), (3) food and nutrition (q. v.), (4) irrigation (q. v.), and (5) Drainage. See also AGRICULTURAL EDUCATION.

**RECENT EXPERIMENTS.** In Alaska cereal breeding, testing of varieties of grain, and methods of culture are the important lines of work at the Rampart and Fairbanks Stations. During the past two seasons an unusually large number of varieties of barley, oats, wheat and rye have been matured at Rampart (65 deg. 30 min. N. Lat.). By cross-fertilization a number of new varieties of barley and oats have been developed. At Fairbanks grain, hay and potatoes are being grown on 65 acres and 50 acres are in meadow. The first self-binding reaper in Alaska was used at the Fairbanks Sta-

tion the past summer. Of the large number of hybrid strawberries at the Sitka Station at least a score have proved thoroughly adapted to the coast region of Alaska. The berries are of large size, good substance, and excellent quality. The station herd at Kodiak now contains over 60 Galloway cattle which have wintered on native hay and silage. Experiments with 80 Cotswold and Merino grade sheep and two Lincoln rams have been begun. In Hawaii great interest has been aroused by the station's success in growing Sea Island and Caravonica cotton. These varieties grown perennially and fertilized with phosphates yield two bales and more per acre on land not used for sugar cane. Cuttings can be used for propagation and the pruning so timed as to bring a crop when sugar plantation work is slack. Hundreds of acres have been planted with cotton, and the first shipment of this product from Hawaii in fifty years was recently made to Boston. Rice experiments have shown that ammonium sulphate is cheaper than nitrate of soda and doubles yield if the fertilizer is applied at planting or first flooding instead of at second flooding as in oriental practice. Experiments have shown that clean cultivation increases the flow of sap from rubber trees. The station has killed the weeds in rubber plantations by spraying with arsenite of soda, at an expense of \$1.25 per acre.

In Porto Rico the station has shown that excessive growth of bacteria in certain soils prevents good crops, and that deep plowing and use of chemicals will remedy this; also that chlorosis of pineapples is due to excessive carbonate of lime in the soil. Windbreaks have been shown to be essential to citrus fruit culture, chiefly because they regulate moisture and enable beneficial fungi to keep down scale insects. Coffee experiments are proceeding on 90 acres near Mayaguez and 20 acres north of Ponce. The famous high-priced varieties, such as Blue Mountain of Jamaica and Padang of Java, have done well. A station for cane growing and the sugar industry has been established by the Porto Rican planters during the year.

In Guam the station has 20 acres out of 27 in the recently purchased tract under cultivation. Emphasis is laid on experiments with forage crops, e. g., sorghum, grasses, soy beans, velvet beans, cowpeas, preparatory to introduction of livestock. Small cultivators, worth about \$5 apiece have been introduced. With these cultivators one man can do as much work as ten can with the old-style implements used by the natives.

The Rothamsted Station in England has reported the important work of Russell and Hutchinson on the effect of partial sterilization by heat or volatile antiseptics on the productiveness of soils. Such treatment reduces the number of protozoa which live on soil bacteria and thus permits the more abundant development of ammonia-producing bacteria.

In Canada an appropriation of \$185,000 has been made for the maintenance of the Dominion's agricultural experiment stations, which also includes \$45,000 for additional experimental farms.

In Australia experiments in dry farming on the American plan are being undertaken. The South Australian government has purchased 1600 acres of land for the establishment of a government dairy farm.

A tobacco experiment station has been established at Danli, Honduras.

The Jewish Agricultural Experiment Station, endowed with funds contributed by American Jews, has been located on 125 acres of land about 7 miles from Haifa in Palestine. It is under the directorship of Aaron Aaronsohn and is especially intended to promote the improvement of agricultural practice among the Jewish people of the region. Studies will also be made of the wild prototypes of cereals.

Plans have been completed for the experiment station at Oaxaca, Mexico. This will be located on a plantation of several hundred acres in the sugar region. Extensive orchards, of peaches, olives, oranges, etc., will be planted, and the equipment will include an irrigation system and experimental sugar mill. The buildings will cost over \$100,000. Special attention will be given to the introduction, acclimatization and distribution of plants and to studies in sugar production and manufacture.

The experiment stations in Austria have organized into an association and have designated an official organ for the association.

#### AGRICULTURAL LABOR PROBLEM. See AGRICULTURE.

**AGRICULTURE. PRODUCTION IN 1910.** Agricultural production in the United States during 1910 reached the highest value ever attained by any country—a total of \$8,926,000,000. This is an increase of \$305,000,000 over the previous year. There has been an uninterrupted increase in value of farm products since the census year of 1899, the figures for 1910 being 89.2 per cent. higher than for that year. This is in spite of the drought which prevailed in 1910 in many sections, especially the West, indicating the wide extent of the country and its varied climate, soil, and crops. Illinois led all the States in total value of crop production, with over \$290,000,000, followed by Iowa with \$234,000,000. The values for some of the other leading States, based on their principal crops, were Missouri \$188,000,000, Texas \$134,000,000, Ohio \$182,540,000, Minnesota \$175,000,000, Indiana \$174,000,000, Kansas \$168,000,000, Pennsylvania \$161,000,000, and Nebraska \$147,628,000. The crops of corn, oats, total of all cereals, and tobacco were the largest ever produced, but owing to the prices prevailing cotton was the only crop that reached its highest value. The crops of rice, hay, beet sugar, and total sugar were next to the highest in quantity, and wheat, oats, barley, tobacco, flaxseed, and sugar were next to the highest in value for any year. The corn crop of 3,125,713,000 bushels was worth to the producers \$1,523,968,000. This is not a board of trade value, but the price at point of delivery by the farmer. It lacks but \$3,000,000 of equaling the total value of the imports of merchandise during the fiscal year 1910. The world's production of precious metals, which has been regarded as such a factor in the present high prices, equals for the year only one-third the value of the corn crop. Judged by value, corn was a far more important crop than cotton, which is next to it. Including the value of the seed, the latter is valued at about \$900,000,000. The hay crop stands third in value, \$747,769,000; and wheat, which has usually exceeded cotton until very recent years, comes fourth with a farm value of \$621,443,000. The yields in 1910 were above the five-year averages in the case of corn, oats, rice, buckwheat, sugar, potatoes,

tobacco, and wool. A comparison of statistics for several decades clearly shows that the yields per acre of the leading crops are now increasing, and the percentage of this increase in many States is greater than the percentage of normal increase in population. The percentage of the total area of the United States devoted to certain crops in the decade 1900-1909 was as follows: Corn 5 per cent., wheat 2.5 per cent., oats 1.6 per cent., potatoes 0.2 per cent., and cotton 1.5 per cent. The figures for corn, wheat, and oats are considerably larger than for the decade 1880-1889.

The final estimates of the Crop Reporting Board of the Bureau of Statistics, United States Department of Agriculture, based on the reports of the correspondents and agents of the Bureau, indicate the harvested acreage, production, and value of important farm crops of the United States, in 1910 and 1909, to have been as follows:

## CROP AREAS, YIELDS, AND VALUES, 1910.

Crop	Acreage	Production	Farm value December 1	
			Per bushel	Total
	<i>Acres</i>	<i>Bushels a</i>	<i>Cents</i>	<i>Dollars</i>
Corn, 1910 .....	114,002,000	3,125,713,000	48.8	1,523,968,000
1909 .....	108,771,000	2,772,376,000	59.6	1,652,822,000
Winter wheat, 1910 .....	29,427,000	464,044,000	89.1	413,575,000
1909 .....	28,330,000	446,366,000	102.9	459,154,000
Spring wheat, 1910 .....	19,778,000	231,399,000	89.8	207,868,000
1909 .....	18,893,000	290,823,000	93.1	270,892,000
All wheat, 1910 .....	49,205,000	695,443,000	89.4	621,443,000
1909 .....	46,723,000	737,189,000	99.0	730,046,000
Oats, 1910 .....	33,288,000	1,126,765,000	34.1	384,716,000
1909 .....	33,894,000	1,007,353,000	40.5	408,174,000
Barley, 1910 .....	7,257,000	162,227,000	57.8	93,785,000
1909 .....	7,011,000	170,284,000	55.2	93,971,000
Rye, 1910 .....	2,028,000	83,039,000	72.2	23,840,000
1909 .....	2,006,000	32,239,000	73.9	23,809,000
Buckwheat, 1910 .....	826,000	17,239,000	65.7	11,321,000
1909 .....	834,000	17,438,000	69.9	12,188,000
Flaxseed, 1910 .....	2,916,000	14,116,000	230.6	32,654,000
1909 .....	2,742,000	25,866,000	152.6	39,466,000
Rice, 1910 .....	722,800	b 24,510,000	67.8	16,624,000
1909 .....	720,225	24,368,000	79.4	19,341,000
Potatoes, 1910 .....	3,591,000	338,811,000	55.5	187,985,000
1909 .....	3,525,000	376,537,000	54.9	206,545,000
Hay, 1910 .....	45,691,000	c 60,978,000	d\$12.26	747,769,000
1909 .....	45,744,000	c 64,938,000	d\$10.62	689,345,000
Tobacco, 1910 .....	1,233,800	e 984,349,000	f 9.3	91,459,000
1909 .....	1,180,000	e 949,357,000	f 10.1	95,719,000

a Bushels of weight. b Equivalent to 5,930,000 bags of 186 pounds, average weight. c Tons. d Per ton. e Pounds. f Per pound.

The total value of crops above specified on December 1, 1910, was \$3,735,464,000, against \$3,971,426,000 on December 1, 1909. The average of prices was about 8.5 per cent. lower on December 1, 1910, than on December 1, 1909.

**PRICES.** The year was one of high prices for meat and animals, poultry and eggs, and for butter and milk. The gain in value of animal products amounted to \$424,000,000. The dry season on the ranges of the West led to the marketing of cattle and sheep in enormous numbers, from Texas to Montana. The slump in wholesale prices in the late fall was not followed by a corresponding reduction to consumers, which led the latter to place the blame on the retailers. The South is awakening to its possibilities as a grazing country. The successful fight against the cattle tick is offering encouragement to cattle raising for beef on the vast upland tracts. Within the past four years the tick has been exterminated from 129,611 square miles. The northern edge of the quarantine line is being pushed steadily south, and the handicap to cattle raising thus removed.

**FOREIGN TRADE.** The balance of trade in agricultural products in favor of the United States

fell from over \$488,000,000 in 1908 to \$274,210,152 in 1909, and to \$198,090,925 in 1910. The prices of farm products were so high as to prevent the free export movement which existed before. The value of the agricultural exports in 1910 was \$871,107,067, the principal items in point of value being cotton, packing-house products, grain and grain products, tobacco, oil and oil-cake meal, fruits, and live animals, in the order named. There was a decrease in all these except cotton, tobacco, and fruits. The value of imports of farm products has constantly increased year by year, reaching the enormous sum of \$687,486,188 in 1910, an amount much above that for 1909. Prominent among these imports were packing-house products (mostly hides and skins) \$130,140,313, sugar and molasses \$107,716,367, coffee \$69,194,333, silk \$67,119,108, wool \$51,220,844, vegetable fibers \$48,234,977, tobacco \$27,756,133, and fruits \$24,177,160. The exports of forest products

amounted to \$85,054,606, the highest for any year except 1907 and 1908, but the imports, consisting mostly of India rubber, wood pulp, pulp wood, and woods not grown in the United States, were more than double this amount—\$179,610,886, the highest point yet reached.

**PRODUCTION IN FOREIGN COUNTRIES—CEREALS AND VEGETABLES.** Despite unfavorable weather conditions in some parts of Europe the European wheat crop is thought to be nearly or quite equal to the unprecedented crops of the previous season. This is largely due to the Russian crop, estimated at 772,600,000 bushels, or only 10,000,000 bushels less than the high record crop of 1909. Preliminary figures for Victoria and South Australia indicate yields varying to no important extent from the high records of last season, and the promise is for from fair to good results in New South Wales. The total wheat crop for Australia is placed at 93,263,000 bushels. This indicates an export surplus equal to that of 1909, which amounted to about 52,000,000 bushels. The wheat crop of Argentina, the harvest of which is not completed until the middle of February, is estimated at fully 150,000,000 bushels. Late trade reports indicate

losses from drought in the south, but the area affected is at present indeterminable. The summer in Great Britain was deficient in sunshine, with low temperatures and excessive rain. The per acre yields of cereals were high, as usual, but not up to those of 1909. Wheat yielded 58,300,000 Winchester bushels, barley 65,000,000 bushels, oats 127,778,000 bushels, and potatoes 129,856,000 bushels. The hay crop was about 9,560,000 long tons. The season was unfavorable in France, the summer being cold and wet. Potatoes were only a half crop and sugar beets were reduced in both yield and quality. The potato crop is reported as short in all parts of Belgium, being a complete failure in some localities; and in Germany the crop was reduced, having suffered from disease, especially in the southern part of the empire. The deficient wheat crop of Italy indicates the import requirements at about 75,000,000 bushels, as compared with 35,000,000 bushels last year. The rice crop of that country is placed at 965,615,000 pounds against 1,093,000,000 pounds in 1909; and corn at 97,750,000 bushels, against 94,821,000 bushels the previous year.

The production of corn in Russia was 76,000,000 bushels, of barley 440,000,000 bushels, and of oats 1,100,000,000 bushels. The corn crop of Hungary is estimated at 195,000,000 bushels, an increase of more than 30,000,000 bushels over 1909, and the potato crop at 170,000,000 bushels, or nearly 14,000,000 bushels less than in 1909, but still 15,000,000 bushels above the average. In Roumania the corn crop is placed at 106,000,000 bushels, wheat at 106,000,000 bushels, barley at 29,358,000 bushels, a large increase over 1909, oats at 29,647,000 bushels, and rye at 7,885,000 bushels. The farming interests of Chile have suffered greatly from want of rain. The indications of less than a half crop of wheat, barley, or corn on unirrigated land are reported, which means a wheat supply from two to three million bushels less than the home demand in place of an export of 4,000,000 bushels. The drought also seriously affected the stock-raising interests, which were not prepared to feed stock. It will necessitate additional imports of beef cattle from Argentina, which amounted to 93,519 head in 1909.

**SHEEP RAISING:** The statistical year for the wool trade of Australasia, which closed July 1, 1910, was the most prosperous year in the history of the wool trade. This was due to abundant rainfall and the high prices of wool. The number of sheep in Australia and New Zealand increased during the year, the total amounting to 115,525,581 head, approaching the record year of 1891. These two countries shipped during the year 2,483,643 bales of wool, valued at \$161,004,490, a large increase in amount and value as compared with the record clip of the previous season. The progressive passing over of vast estates in Russia, upon which large herds of sheep were formerly kept, into the hands of peasants has resulted in the steady reduction of the flocks in European Russia. These estates were cut up into small holdings. This factor and the increasing rate of land rent have resulted in a considerable falling off in the wool production of that country.

**AGRICULTURE IN URUGUAY.** Statistics recently published on the agricultural and livestock census of Uruguay for 1908 show 43,061 farms or ranches, covering an area of 42,302,021 acres. Less than 2,000,000 acres of this land is cultivated; forests occupy over a million acres and

the balance is given up to pasture. This immense pasturage was divided into 60,485 fields, on which 1,104,903 cattle were wintered the year preceding the census. There were 109,449 persons employed in the agricultural and livestock industry.

**THE TEA TRADE.** The London *Times*, in a review of the tea trade for 1909-10, gives the world's production at about 1,200,000,000 pounds, distributed as follows: China 600,000,000, India 262,000,000, Ceylon 191,000,000, Natal 2,000,000, Japan 63,000,000, Java, Formosa, and all other countries 82,000,000 pounds. About half of that produced in China and a third of that grown in Japan is consumed locally. On account of the growing popularity of Indian and Ceylon teas, Japan has arranged a ten-years' campaign for the United States, at an annual cost of \$80,000, toward which the government is expected to give a subsidy of \$50,000. Tea drinking is steadily increasing in South American countries.

**THE INTERNATIONAL AGRICULTURAL INSTITUTE** at Rome has been placed on a working basis, and is now issuing a monthly bulletin giving such information as is available as to the area and condition of crops in different countries of the world. An estimate for cereals was issued near the close of the year. A bulletin dealing with agricultural coöperation, insurance, and credit for several countries has been published. Count Faina has resigned from the presidency of the Institute and has been succeeded by the Marquis Cappelli.

**TOXICITY OF COTTON-SEED MEAL.** An important discovery of the year relates to the poisonous property of cotton-seed meal when fed to livestock, especially pigs and calves. The United States Department of Agriculture has announced the finding of an inorganic body, a salt of pyrophosphoric acid, to which the toxicity seems to be due. Phosphoric acid has been known to exist in the meal in considerable quantities, but its relation to toxicity has not hitherto been shown. By heating the meal, as is done in extracting the oil at the mills, a part of the phosphoric acid is changed to pyrophosphoric acid, known to have poisonous properties. Different kinds of meal are found to vary in toxicity, which agrees with practical experience. While the seed from Upland cotton was quite generally poisonous to stock, that from certain Sea Island cotton was practically harmless, although heating the latter resulted in the formation of an appreciable amount of the poisonous principle.

**LEGISLATION IN GREAT BRITAIN.** A far-reaching measure, known as the Development and Road Improvement Funds Act, was passed by the British Parliament at the close of 1909. While the purpose of Part I of the act is "to promote the economic development of the United Kingdom," much prominence is given to aiding and developing agriculture and rural industries, by encouraging research, instruction, and experiment, the organizing of co-operative enterprises, and the extension of the provision of small holdings. There is also provision for the improvement of rural transportation, development of forestry through teaching and experimentation and through afforestation of lands found suitable, the reclamation and drainage of lands, and the development and improvement of fisheries. A consolidated fund of £500,000 is provided for the fiscal year ending March 31, 1911, and for each of the four succeeding years, which the Board of Development Commissioners may loan or grant to institutions,

organizations, or individuals for the purposes of the act. It has been announced that horse breeding will be one of the enterprises subsidized. The second part of the act relates to road building, providing for a road board which is authorized to borrow up to £200,000 a year, to be employed in grants or loans.

**CANADIAN FARMERS AND THE TARIFF.** In Canada a large deputation of farmers, nearly a thousand in number, representing provinces from Prince Edward Island to British Columbia, gathered in Ottawa December 10 to lay before the Prime Minister the request for tariff reform and other measures. The movement started with the grain growers' organizations of the prairie provinces, who were joined by the Council of Agriculture, a Dominion-wide organization. The deputation is without precedent in Canadian or British political history. Among the questions presented were lower duties in the tariff and reciprocity with the United States, government ownership and operation of terminal elevators on Lake Superior, in connection with which frauds have been perpetrated on a large scale, and the construction by the government of a railway giving to the prairie provinces an outlet for their grain by way of Hudson Bay. On the last two points the outcome was favorable, but on the tariff the Premier's statement gave little encouragement to the deputation.

**LEGISLATION IN BRAZIL.** A bureau of agricultural inspection has been organized in Brazil, with a corps of 15 inspectors of agriculture, to report on crop conditions, soils, water supply, irrigation possibilities, and every subject pertaining to agriculture, as well as to collect and disseminate useful information among farmers, promote the introduction of new crops, etc. An expenditure of \$300,000 in the northern states has been authorized for the introduction of irrigation and dry farming methods necessitated by the drought which has prevailed. A new law for irrigation and dry farming in Brazil makes provision for opening up remote regions by rail and highways, irrigation reservoirs and artificial wells, dikes along rivers which overflow in the rainy season, the drainage of lowlands along the coast, and the general adaptation of land suitable to cultivation in every way possible. The various measures are to be carried out either by the federal government on its own initiative or with the aid and coöperation of the state governments.

**LEGISLATION IN MEXICO.** In accordance with a law passed at the close of 1909 the federal agricultural services in Mexico have been reorganized. The new general bureau of agriculture, divided into five departments, has entered upon its duties, and national chambers of agriculture have been established in 11 of the more important agricultural states of the Republic. The Mexican Government has withdrawn its public lands from sale. In the past large tracts of these lands have been secured by companies for colonizing purposes, but the opportunity for this is now suspended.

**THE TURKISH GOVERNMENT** has appointed a director of agriculture for Bagdad, who has advised the establishment of an agricultural bank and an agricultural school, and is urging the richer owners of land to adopt modern ploughs, mechanical reapers, and threshing machines. This it is thought will make a demand for agricultural machinery in Asia Minor. To promote the growing of corn in the southern part of Rus-

sia, that country is reported to have removed the duty on all utensils and machinery required in the cultivation of the crop.

**LEGISLATION IN THE UNITED STATES.** A Federal law relating to the manufacture, sale, and interstate transportation of adulterated or misbranded insecticides and fungicides was passed in the United States during the year and went into effect January 1, 1911. The execution of the inspection rests with the Bureau of Chemistry of the United States Department of Agriculture. In the interest of horse breeding in the United States, stallion registration laws have now been passed and are in operation in 15 States. The object of these laws is to exclude unsound or diseased animals from service, and guard against fraud in the case of animals claimed to be pure bred. An important result has been a rapid elimination of unfit animals and greater attention to the breeding and registry of stallions offered for public service. An organization of officials charged with the administration of these laws was formed in the summer of 1910, with a view to securing unification of the State laws.

**COST OF PRODUCTION.** One of the most significant features of the year was the quickened public interest in agricultural production and distribution growing out of the cost of living. This led to a more searching inquiry as to the factors which influence the cost of production and distribution, and the relationship between what the producer receives and what the consumer pays for products which are not manufactured, but are merely handled. This inquiry has developed the lack of systematic economic studies in relation to agriculture upon which to base reliable and broad-minded deductions. The subject of agricultural economics has only recently begun to receive attention in the United States, but the present situation strongly emphasizes the need and the utility of it from the standpoint of the producer, the consumer, the intervening agencies, and the lawmakers. The farmer's relation to the increased cost of living has been given attention in the United States and in Europe. In Europe statistics are presented to show that, in some sections at least, the farmer is not reaping the benefit of high prices, since the cost of raising meat, dairy and other farm products has steadily increased. It is shown that as a matter of fact the farmer now gets a less return for his labor than a few years ago, and that the industry is becoming less profitable year by year. This results from the increased cost of labor and other supplies which the farmer has to purchase. In the United States investigations by the Secretary of Agriculture of the prices received by the farmer and those paid by the consumer lead him to conclude that "the consumer has no well-grounded complaint against the farmer for the prices that he pays." He maintains, however, that the farmer has benefited more than others from the changed conditions in values, for the ten leading agricultural crops have increased in the past decade 72.7 per cent. in value at the farm, whereas 85 articles commonly used by the farmer show an average increase of 12.1 per cent. The grand average increase in purchasing power per acre of all crops has been 54 per cent. But the greater part of the farmer's prosperity rests upon a higher yield per acre; farmers and farming have become more efficient.

A special committee of the United States Sen-

ate investigated wages and the prices of commodities in the spring of 1910. It reported that the advance in prices of farm and food products, although world-wide, had been somewhat more rapid in the United States than in Europe, with the possible exception of Russia. Canada also showed a rapid advance. Among the causes assigned were an increased cost of production owing to higher land values and higher wages, increased demand for products, shifting of population from food-producing to food-consuming occupations and locations, reduced fertility of land, increased banking facilities in agricultural localities which enable crops to be held for more favorable market, holding products in cold storage, cost of distribution, and organization of producers and of dealers. In the past decade the wages of farm labor have increased on an average about 60 per cent., and the cost of farm land has practically doubled. Nearly all agricultural implements and supplies have advanced in price except binder twine. The report says: "Witnesses claim that farming operations were conducted at a loss or at best with only a very slight margin of profit for several years, and that only during the past two or three years have farmers been able to secure a fair return on their labor and investment." A comparison of wholesale prices in 1900 and 1910 showed that cereals, corn, cotton, flaxseed, hay, hops, hogs, and steers had all advanced, from 34 to 153 per cent., the advance in hogs being about 110 per cent. The percentage increase in the price of farm products in the decade was twice as great as in any other group of commodities, food products coming next. Considering the production of staple crops and the decline in exports, it is shown that the supply available for home use has increased and that this has been attended by an increased domestic consumption.

A committee on the cost of living, appointed in February, 1910, by the Massachusetts Legislature, rendered a voluminous and comprehensive report in which prominence is given to the restriction of agricultural production and the enhancing of cost through the drain of population from the land. The scarcity and increased wages of farm labor, with demand for shorter working hours, is cited as a potent factor in increasing the cost of agricultural products. Another factor mentioned is the uneconomic methods of production and distribution, especially the latter. The commission says: "Were a clearing house, for information only, organized—an exchange to which all carload shipments of produce were promptly reported—and a central committee appointed to issue orders for consignments from the various sources of supply after going over the receipts for the day, crowded markets would be greatly reduced in number. With a shippers' exchange on the one hand, co-operating with a commission men's exchange on the other, most of the present waste would be eliminated."

Studies of the incomes of 178 farms of various kinds in New York State, published by the experiment station of Cornell University, show that, allowing interest at 5 per cent. and deducting labor of members of the farmer's family other than himself, the average return for the year's work was \$981, in addition to the use of a house and such products as the farms furnished. The return on the investment was 7.9 per cent. for 60 general farms, 8.7 per cent. for 67 dairy farms, 9.7 per cent. for 6 truck farms,

13.7 per cent. for 14 potato farms, and 19.8 per cent. for 31 fruit farms. Comparisons of the most successful and least successful farms of various types showed about double the income for the most successful ones, whereas the expense for the two classes was about the same. In other words, success was measured by the farmer's efficiency in production. The cost of agricultural production has been determined by the Minnesota Experiment Station from statistics gathered over a period of six years from over 80 farms. The average cost of growing an acre of barley was \$8.21, of corn \$10.26, of oats \$8.86, of wheat \$7.25, and of potatoes (machine production, using fertilizer) \$37.72. The cost of maintaining a milch cow was \$40.97 a year exclusive of shelter, and of feeding a farm work horse \$51.39.

The United States Tariff Board is making an effort to determine the cost of production of leading farm products, as a basis for a tariff representing the difference between cost of production at home and abroad. In the case of wool, for example, it is proposed to substitute real facts for guesswork and *ex-parte* statements. Considerable difficulty is experienced in gathering such data, as few studies of the kind have been made and farmers rarely keep books with their farm output.

**COUNTRY LIFE; SMALL HOLDINGS; AGRICULTURAL LABOR.** There has been much public discussion of the necessity for the reorganization of agriculture and rural life, in which coöperation is to dominate as a means of enabling the farmer to secure a reasonable profit and a larger net income for his industry. While education will help to solve some of the economic problems of farming, coöperation is looked upon as the most helpful agency in bringing this about. An important conference on agriculture and country living, lasting three days, was held at Albany, N. Y., in January, 1910. The methods and agencies for the advancement of agriculture were considered, resolutions adopted, and the State agricultural society reorganized. The fourth annual New England Conference on Rural Progress was held in Boston in March. A notable conference was held at the New York Produce Exchange in May, on the subject of increasing the productivity of New York farm lands. Chambers of Commerce, railroads, the grange, and agricultural societies joined in the call, and the attendance reached nearly a thousand. In April a meeting was held at Bryn Mawr College to consider the opportunities open to women in various branches of agriculture, horticulture, and stock raising.

The National Farm Homes Association was organized at St. Louis in May with Governor Hadley as president, as a philanthropic movement for encouraging and assisting people from towns and cities to establish homes in the country. The plan includes organizing farm colonies, each colony consisting of a central farm of 160 acres, held by the association, surrounded by 32 farms of 40 acres each, to be acquired by settlers on easy terms. The central farm will serve to instruct the new farmers, will be provided with creameries, mills and other machinery for community use, and will be a headquarters for marketing the produce of the colony.

In Europe rural depopulation and the difficulties growing out of it have made a problem which continues to receive much public attention. Various measures have been considered or set

on foot for remedying the situation and for enabling small farmers to acquire land. Efforts have been made in Denmark for the past ten years to facilitate the acquisition of allotments and small holdings by agricultural laborers. A law passed in 1904 has recently been re-enacted in amended form extending its applications and increasing the value of land which may be so acquired, the State advancing a sum not exceeding nine-tenths of the total value. Favorable terms for interest and repayment are provided. The law places at the disposal of the government a fund of over one million dollars annually for five years to assist in the acquisition of small holdings. Similar action has been proposed in Germany. In Russia a great impetus has been given to agriculture by the distribution of land to peasants which was formerly controlled by large land owners. Where the peasants formerly worked in communal districts, plots of land are now being assigned them for working individually. Following the adoption of this plan, the small credit societies for the assistance of the small farmers have increased at the rate of 1300 a year. The establishment of small banks in the country districts is being considered by the government.

There has been an unprecedented sale of landed property in Great Britain the past year. The market for agricultural land has been good, and the good prices offered have, it is stated, been a prominent factor in leading landlords to sell. The movement to supply small holdings, under an act for that purpose passed two years ago, resulted in 1909 in acquiring 60,889 acres in England and Wales. In the two years the act has been in operation land has been provided for sale or lease for approximately 6600 applicants, and applications have been received from nearly 27,000 persons for a total of 437,124 acres.

The labor problem on the farm continues to call for much consideration. A study of the conditions of agricultural labor in the Vexin district of France, presented before the Agricultural Society of France, showed the economic position of farm laborers to compare favorably with the lot of industrial workers generally. Social conditions are regarded as the chief cause of farm laborers abandoning the country, and to remedy this the erection on each large estate of a hall as a meeting place for entertainment and social purposes, with a library and other educational features, was recommended. In April, 1910, a law was passed in France for insuring and pensioning workmen, including the different classes engaged in agriculture. In Württemberg the experiment has been tried with success of providing places for the registration and care of agricultural and other laborers in search of employment. An investigation of farm labor in California, made under a special act of the legislature, resulted in securing data from 4100 farms. The average duration of employment was found to be less than two months in the year, and only 16.6 per cent. of the white laborers and 10.7 per cent. of the Japanese laborers were employed permanently. White labor was very generally preferred to any of the alien races, but is far from sufficient to meet the needs.

The agricultural credit system in France at the close of 1909 included 96 district banks, with 3127 affiliated local banks, having 147,140 members. The loans during the year aggregated over two million dollars. A new law was passed

during 1910 authorizing mutual credit societies to grant long-time loans to members in order to facilitate the acquisition and development of small holdings. The board of agriculture in Great Britain is working for the establishment of a system of credit banks, and to encourage the further formation of agricultural credit organizations, to assist farmers in times of distress or emergency.

The relative scarcity of crop-selling and exporting associations in Italy has been the subject of comment, and an increase in the number has been urged on the ground that it would tend to equalize prices between producer and consumer, and develop the highest efficiency in Italian agriculture. In Egypt there has been a movement for the organization of agricultural coöperative societies, with a view to improving the economic condition of the small land owners, which comprise a very large proportion of the rural proprietors. A commission appointed to investigate the subject has reported favorably and urged the passage of a law whereby such coöperative societies can be easily organized.

CONVENTIONS AND EXHIBITIONS. There was a large meeting of the Farmers' Coöperative Union at St. Louis in May, southern agriculture being especially represented. Out of the conference grew an alliance with the American Federation of Labor, and the formation of the American Coöperative Union, an attempt to eliminate the middleman by opening stores in large cities for the sale of farm produce direct to consumers. The Farmers' National Congress held its thirteenth meeting at Lincoln, Neb., October 6-11, many papers relating to education, extension, coöperation, and conservation in agriculture being presented. The fifth Dry Farming Congress was held at Spokane, Wash., October 3-6, with over 1200 delegates from the United States, Canada and abroad. These delegates represented about five billion acres of arid lands throughout the world, illustrating the extent of this interest. The consensus of opinion was that dry farming was passing from the experimental stage and becoming an established feature of agricultural development. The Minnesota Conservation Congress, held at St. Paul, March 16-19, aroused special interest among farmers, of whom over three thousand were in attendance. Particular attention was given to the agricultural phases of the problem of conservation. The Chicago Land Show, held the last of November, again illustrated the interest in land and served as a vast advertising campaign in behalf of the new sections and the old unsettled sections. The National Dairy Show, at Chicago in November, was the climax of dairy exhibitions. The International Livestock Exposition, held at Chicago in the latter part of November, was the world's greatest show of farm animals. It surpassed any of its ten predecessors in size—240 car-loads of stock, numbering 4345 head of cattle, sheep, swine and horses; and these exhibits were of unusually high quality. The New England Corn Show, at Worcester, Mass., held in November, was a great success and served to call attention to the high quality of corn which can be grown in the New England States and the good yields secured. A prize crop gave a yield of 127 bushels of shelled corn to the acre.

A jubilee of the German Agricultural Society, commemorating its twenty-fifth anniversary, was held at Berlin, December 8-14. Vast audiences in the building of the Prussian Diet listened to the congratulations of the German Emperor, the

Imperial Chancellor, the Prussian Minister of Agriculture, and other distinguished personages. The society was organized in December, 1885, with 2700 members. In 1910 the membership had reached 18,000. The society's annual show was held at Hamburg, June 2-7, with a larger attendance than any previous show. The 1911 exhibition will be at Cassel, June 22-27. At the annual meeting of the Royal Agricultural Society of England in December, it was announced that the membership had reached 10,129. The society is assisting agricultural research in a substantial manner. Its seventy-first annual show was held at Liverpool, June 21-25. The attendance was somewhat interfered with by the weather, but the exhibition itself was pronounced one of the finest the society has ever organized. The 1911 show will be held at Norwich on the Crown Point estate.

A society for the improvement of agriculture in Spain has been formed, to foster agricultural education, introduce modern farm machinery, improved plants and seeds, commercial fertilizers, insecticides and fungicides, and to promote the employment of improved methods in combating animal disease. International congresses of tropical agriculture, agricultural societies, and horticulture, were held at Brussels in connection with the Brussels Exposition. Agriculture was represented by one of the sections in the International Scientific Congress at Buenos Ayres, July 11-25. Resolutions were adopted advocating the formation of agrarian societies patterned after those in France, the greater use of agricultural machinery and additional instruction in the subject, the development of the sugar beet and cotton growing industries, and the adoption of uniform regulations in all American countries as to the importation and exportation of animals. An International Agricultural Exposition was held at Buenos Ayres during the summer, with exhibits from many foreign countries. The United States was the chief exhibitor among foreign nations.

UNITED STATES DEPARTMENT OF AGRICULTURE. The total number of employes of the Department, July 1, 1910, was 12,480, of whom 2414 were employed in Washington. The net increase in the force during the year was 1340. The appropriations by Congress for the work of the Department during the fiscal year 1910 aggregated \$17,029,036, including \$3,000,000 for meat inspection, \$1,344,000 for the State agricultural experiment stations and \$460,000 for printing and binding. For the rent of buildings in the District of Columbia the Department paid \$72,645.

The cases reported to the Attorney-General for prosecution under the several laws administered by the Department numbered 1738, twice as many as the year before. More than \$40,000 in fines and costs were assessed; hundreds of tons of misbranded foods and drugs were forfeited. During the fiscal year 1910 the Department issued 1983 publications, of which 1520 were new. The total number of copies printed was 25,160,469, of which over 9,000,000 copies were Farmers' Bulletins.

The Bureau of Animal Industry, besides its extensive service in connection with meat inspection (q. v.), has enlarged its work in cattle-tick eradication, over 57,000 square miles being released from quarantine during the year. The efficiency of the serum treatment for hog cholera, devised by the Bureau, has been strikingly demonstrated.

The agricultural explorers of the Bureau of Plant Industry have recently brought back many valuable plants from southwestern Asia, including a long-lived variety of alfalfa, a drought-resistant cherry, apricots with sweet kernels, hardy olives, etc. Experience of the last three years has shown that Rhodes grass, which has fine upright stems and good seed habits, is especially adapted to the Gulf coast region. The Kharkov variety of hard winter wheat has given excellent results. The destructive tumor disease of limes and other citrus fruits has been shown to be of fungus origin. The new method of spraying with sulphur compounds has been widely adopted by apple growers.

Conditions revealed in the course of the enforcement of the Food and Drugs Act have led to investigation of the process of manufacture and subsequent handling of fruit and dairy products, poultry, fish and oysters. See FOOD AND NUTRITION.

The Bureau of Soils has surveyed and mapped 359,504 square miles, or 230,120,960 acres since 1899.

The Bureau of Entomology, in coöperation with State authorities in New England, has conducted an active campaign against the gipsy and brown-tailed moth. Great service has been rendered to the citrus fruit growers of California and Florida, by investigations of hydrocyanic-acid gas fumigation for repression of scale insects and white fly.

The inspection of important nursery stock has prevented the introduction of many injurious insects. See ENTOMOLOGY.

The Biological Survey has carried on an active campaign against rats, which are carriers of bubonic plague, and the California ground squirrel, which has become plague-stricken. The most effective means of destroying the ground squirrel is the use of whole barley coated with a starch solution holding strychnine in suspension. Attempts to poison mice and chipmunks, which hinder attempts at reforestation by eating the tree seeds, have been very successful.

During the past year the Office of Public Roads built 55 object-lesson roads, illustrating 10 types of construction. An oil-cement concrete has been developed which promises to have a wide use in structures where strength, solidity and waterproof qualities are required.

The Forest Service has had a great struggle with forest fires which have been unusually destructive during the past two years. It is estimated that there are about 15,000,000 horsepower of water in the national forests which might be controlled and beneficially used. See FORESTRY.

The Office of Experiment Stations has enlarged its work in relation to the agricultural colleges, schools, experiment stations, extension departments and farmers' institutes (see AGRICULTURAL EDUCATION AND AGRICULTURAL EXPERIMENT STATIONS), and continued investigations on human nutrition with the respiration calorimeter (see FOOD AND NUTRITION) and on irrigation and drainage (see IRRIGATION AND DRAINAGE).

The Report of the Secretary of Agriculture for 1910 contains an interesting summary of the quantity and value of the year's crops, and a discussion of the farmer's share of the prices paid by consumers for agricultural products. The Secretary also claims that production per acre is increasing and overtaking the increase in population. The formation of coöperative or-

ganizations for the purchase of agricultural products directly from the farmers is advised.

**DEATHS.** Prof. Julius Kühn of Halle, Germany, a veteran teacher of agriculture and the head of the agricultural institute at the University of Halle from its organization, died April 14, 1910. Dr. O. Büttcher, vice-director of the experiment station at Möckern, Germany, and widely known for his investigations in animal nutrition, died February 2. Dr. Charles Anthony Goessmann, agricultural chemist and one of the oldest and most eminent agricultural investigators in the United States, died at Amherst, Mass., September 1, 1910. Dr. William Henry Brewer, associated with the history of the earliest undertakings in agricultural instruction, died at New Haven, Conn., November 2. Prof. Samuel B. Green, horticulturist and forester of the Minnesota College of Agriculture and Experiment Station, died July 11. Prof. John A. Craig, a breeder of livestock, one of the pioneers in instruction in animal husbandry, and formerly director of the Texas and the Oklahoma experiment stations, died August 9. Prof. Welton M. Munson, in charge of horticulture in the West Virginia University and Experiment Station, died September 9. Prof. J. S. Newman, of South Carolina, a pioneer worker for southern agricultural advancement, and for many years a teacher and experimenter, died May 11, 1910. James J. H. Gregory, a veteran seedsman, originator and writer on vegetables, of Marblehead, Mass., died February 20, 1910. See also articles on AGRICULTURAL EDUCATION; AGRICULTURAL EXPERIMENT STATIONS; DAIRYING; FERTILIZERS; SOILS; STOCK RAISING; ALFALFA; BARLEY; CORN; COTTON; HAY; OATS; SUGAR; TOBACCO, and other crops; the paragraphs on *Agriculture* in the respective articles on the States of the United States and on foreign countries; and the allied articles on BOTANY; FORESTRY; HORTICULTURE; FOOD AND NUTRITION; MEAT AND MEAT INSPECTION; VETERINARY SCIENCE; DRAINAGE; IRRIGATION, etc.

**AHMED MIRZA.** See PERSIA.

**AIRSHIPS.** See AERONAUTICS.

**ALABAMA.** One of the East South Central Division of the United States. Its total area is 51,998 square miles, of which 719 square miles are water.

**POPULATION.** The population of the State in 1910, according to the figures of the Thirteenth Census, was 2,138,003 as compared with 1,828,697 in 1900 and 1,513,401 in 1890, an increase from 1900 to 1910 of 16.9 per cent. The State ranks eighteenth among the States in population, the same relative place which it held in 1900. The population of the chief cities and towns, according to the Thirteenth Census, will be found in the article UNITED STATES CENSUS. The great industrial growth of the State in the last decade is shown in the remarkable increase in population in the city of Birmingham, which is the chief centre of the iron industries of the State. This city showed an increase from 38,415 in 1900 to 132,685 in 1910, or 245.4 per cent., a greater increase than was shown in the population of any other of the largest cities of the country.

**MINERAL PRODUCTION.** The chief mineral products of Alabama are coal and iron. In the production of the former it ranks fifth, being surpassed only by Pennsylvania, West Virginia, Illinois and Ohio. The production of coal in 1909 amounted to 13,703,450 short tons, having

a spot value of \$16,305,168. This was an increase of 2,098,087 short tons in quantity and \$1,657,297 in value over 1908. It was, however, 547,004 tons less than the record of 1907. With the exception of the latter year the production in 1909 was the largest in the history of the State. These figures indicate a recovery from the effects of the business depression in 1907-8. The conditions in 1909 were less favorable to the development of new properties than any former recovery from periods of depression. Mining in Alabama is carried on chiefly on the open shop basis. During 1909 the industry was not affected by labor troubles, not a single strike, suspension or lockout being reported. According to the State mine inspector, there were 129 men killed and 50 injured in the coal mines of the State in 1909, as compared with 108 killed and 58 injured in 1908.

Reports at the beginning of 1911 indicated the production for 1910 would reach the unprecedented total of 15,000,000 tons, as compared with 13,703,910 tons in 1909. The increase was due chiefly to the prolonged strike in Illinois and the western States, and to river conditions which existed during the year and which materially reduced the shipments from Pennsylvania and other northern States to New Orleans and other lower Mississippi points and added to the demand from that section for Alabama coal. There were no strikes of any consequence in the coal mines of the State during 1910, and the labor supply was, on the whole, satisfactory, although in places there was a decided shortage. The coal mining industry was affected during the year by two bad disasters, which altogether cost the lives of 131 men. The first was at the Mulga mine on April 20, and cost 40 lives; the second was at Palos on May 5, and cost 91 lives. The number of lives lost in these two accidents was more than the number of lives lost in the coal mines of the State either in 1909 or in 1908.

A small quantity of gold is produced. This was valued in 1910 at \$29,416, as compared with a value of the product of 1909 of \$29,200.

**AGRICULTURE.** The acreage, production and value of the principal crops in 1909-10 are shown in the following table:

		Acreage	Prod. bu.	Value
Corn,	1910....	3,524,000	63,432,000	\$45,037,000
	1909....	3,233,000	43,646,000	37,099,000
Winter	1910....	130,000	1,560,000	1,763,000
Wheat,	1909....	98,000	1,029,000	1,338,000
Oats,	1910....	297,000	5,494,000	2,296,000
	1909....	270,000	4,455,000	3,118,000
Rye,	1910....	2,000	24,000	29,000
Rice,	1910....	1,000	25,000	18,000
	1909....	1,000	35,000	28,000
Potatoes,	1910....	18,000	1,440,000	1,354,000
	1909....	17,000	1,360,000	1,333,000
Hay,	1910....	120,000	172,000a	2,270,000
	1909....	110,000	166,000	2,241,000
Tobacco,	1910....	600	300,000b	60,000
	1909....	600	360,000	104,400
Cotton,	1910....	.....	1,174,000c	.....
	1909....	.....	1,024,000	.....
a Tons.	b Pounds.	c Bales.		

The chief feature in the agricultural development of the State in recent years has been the increase in the corn crop. It has, however, slightly increased in acreage and greatly increased in production and value in 1910, as compared with 1909. Cotton is the chief agricultural product of the State. The crop in 1910 showed a slight increase over that of 1909.

Since 1903 the value of the crop has greatly exceeded that of the years previous. The other crops, as will be seen from the table above, show about the same acreage in 1910 as in 1909.

**EDUCATION.** There were in 1910 687,374 children between the ages of 6 and 21 in the State. Of these 380,142 were white and 307,232 were colored. The total enrollment in the schools of the State, including all institutions, public, private and denominational, was about 76 per cent. among the whites, and 48 per cent. among the colored. The total enrollment of white children in the public schools was 279,982, and in the colored public schools, 142,813. The average daily attendance among the white children was 176,500, and of the colored children 89,000. The number of schools for white children in 1910 was 4424, and for colored children, 1965. There were employed in the schools of the State 6434 white teachers, and 2243 colored teachers. Of the white teachers 2272 were males and 4162 were females. The average monthly salary for white male teachers was \$70 and for female teachers, \$46. The average monthly salary for colored male teachers was \$30 and for colored female teachers, \$25. The total expenditures for public schools during the year was \$2,746,473. Of this, \$2,417,378 was paid for the maintenance of white schools and \$329,094 for the maintenance of colored schools.

**FINANCE.** The report of the treasurer for the fiscal year ended September 30, 1910, showed a balance in the treasury on December 30, 1909, of \$712,024. The receipts for the fiscal year amounted to \$5,368,144, and the total disbursements to \$5,646,096, leaving a balance in the treasury on September 30, 1910, of \$433,471. The total bonded debt of the State at the end of the fiscal year amounted to \$9,057,000. The interest paid on this debt in 1910 amounted to \$357,450.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions of the State and the sums paid for their maintenance in 1910 were as follows: Alabama Insane Hospital, \$325,947; Alabama School for the Deaf, \$38,410; Alabama School for the Blind, \$19,952; Alabama School for Negro Deaf and Blind, \$11,500; Alabama Girls' Industrial School, \$36,000; Alabama Industrial School for White Boys, \$19,700. The aggregate expenses of these institutions for the year amounted to \$416,510.

**POLITICS AND GOVERNMENT.** There was no regular meeting of the legislature in 1910, as the sessions in Alabama are quadrennial and the last regular session was held in 1907. There were, however, special sessions called in the intervening years to act on Prohibition and other political questions. The next regular session begins January 10, 1911. The most notable feature in the political history of the State during 1910 was the virtual repudiation of the State-wide Prohibition statutes which have existed in the State for nearly two years. A partial test came in the fall of 1909 when the Prohibition constitutional amendment was voted upon. While the measure was overwhelmingly defeated at this time, there was still some doubt in regard to the attitude of the people of the State toward the policy of Statewide Prohibition, because there were possibly those who, while they favored the policy, were not willing to see it placed forever in the organic law. The Democratic primary for Governor and members of the legis-

lature, which was held on May 3, 1910, was the real test of public sentiment on the question. In this contest the local option element was represented by Emmett O'Neal of Florence county for Governor, while the Prohibitionists had as their leader Col. H. S. D. Mallory. Colonel O'Neal was nominated by over 15,000 votes. The result was somewhat complicated, however, by the fact that E. Perry Thomas of Barbour county, a State Senator who had voted against and fought all the stringent Prohibition laws and who was the candidate for Lieutenant-Governor on the local option ticket, was defeated by Walter D. Seed of Tuscaloosa, a staunch Prohibitionist. Mr. Seed served for four years as State Treasurer. The attitude of the people was shown still more strongly in the election for delegates to the State convention, which met shortly after the primary. This convention was overwhelmingly for local option, although it went on record as in favor of a "fair and impartial trial" of the Prohibition laws. It was no less pronounced, however, on its advocacy of local option. The results in the legislative tickets were almost equally pronounced. The House of Representatives was overwhelmingly for local option, while the majority of the Senate will doubtless favor a modification of the present laws for the counties containing the larger cities. Jefferson county, containing Birmingham, Montgomery county, containing Montgomery, and Mobile county, containing Mobile, will probably have high-licensed saloons, or at least the sale of light wines and beer at cafés and restaurants.

Another political feature of the year was the rapid development of the sentiment in favor of commission government for cities instead of the aldermanic system. It is probable that nearly all the larger cities in each county will be placed under this form of government by the legislature of 1911. Birmingham and Montgomery both voted favorably on the question for such form of government.

**OTHER EVENTS.** One of the most important industrial events of the year was the beginning of work by the United States Steel Corporation on its Village Creek dam project, which will cost \$8,000,000. The project was well under way at the end of 1910. It will supply water to all the company's plants in the district. Work has also begun on the American Steel and Iron Company's new mill at Ensley, which will cost \$3,000,000. This will probably be completed in the summer of 1911. There were two unusually disastrous accidents during the year. An explosion at the Mulga mine of the Birmingham Coal and Iron Company on April 20 resulted in the death of 40 men. An explosion in the Palos mine of the Palos Coal and Coke Company on May 5 cost 91 lives.

**STATE OFFICERS:** Governor, Emmett O'Neal; Lieutenant-Governor, W. D. Seed; Secretary of State, Cyrus B. Brown; Auditor, C. B. Smith; Adjutant-General, Bibb Graves; Attorney-General, R. C. Birkell; Treasurer, John Purifoy; Superintendent of Education, H. J. Willingham; Commissioner of Agriculture, R. F. Kolb; ex-officio Commissioner of Insurance, Cyrus B. Brown—all Democrats.

**JUDICIARY:** Supreme Court: Chief Justice, J. R. Dowdell; Associate Justices, Ormond Somerville, A. D. Sayre, John C. Anderson, R. T. Simpson, J. J. Mayfield, and Thomas McClellan; Clerk, R. F. Ligon, Jr.—all Democrats.

The State representatives in Congress will be found in the article UNITED STATES, section Congress.

**ALABAMA.** See MINERALOGY.

**ALASKA.** A territorial possession of the United States, situated at the northwestern extremity of North America. The total area, according to the revised survey of 1906, is 586,400 square miles. The government of the Territory is as yet unorganized. The population, according to the census of 1910, is 64,356, as compared with 30,507 whites and 29,536 natives in 1900. The Territory is divided into four Judicial divisions: The First Judicial Division, with a population of about 9000; the Second Judicial Division, with Nome as its centre of population, 7000; the Third Judicial Division, with Valdez and Cordova as centres of population, 7000; and the Fourth Judicial Division, with Fairbanks as the centre of population, 10,000. The present and prospective conditions in the Territory are such as to promise a large increase in its population in the next few years. The population is engaged almost entirely in mining, railroad construction and fishing, and occupations incident thereto. A few people are engaged in truck farming, chiefly near the mining camps.

**AGRICULTURE.** The agricultural development of the Territory is as yet inconsiderable, but steady progress was made during the fiscal year 1910. There is no longer any doubt in regard to the agricultural possibilities of Alaska. It has been proved that hardy vegetables and cereals suited to northern latitudes can be grown in Alaska with great success. Important work is being carried on in testing and selecting the varieties best suited to the country, and in developing new varieties which shall be better suited to the climatic conditions than anything now produced. This work has engaged the attention of the Agricultural Experiment Station during 1910. At the Rampart Station grain crops matured and experiments were made in cross-fertilizing for the production of new varieties. At Sitka Station success has been achieved in developing more than a score of varieties of strawberries, which seem to be better adapted to Alaska than any of the known cultivated varieties. Several new homesteads were taken up by settlers during the year, and there is a considerable number of settlers who have lived on their homesteads for more than five years, but have been unable to secure a title to their lands because there was no appropriation of money by Congress to pay the expenses of surveying. At the Kodiak Experiment Station a herd of Gallo-way cattle is maintained with great success. This breed is well adapted to the country. Cattle of other breeds have also done well on Kodiak Island and in other parts of Alaska for many years. A small flock of hardy sheep was added during the year to the livestock at the Kodiak Station and sheep breeding will henceforth receive attention.

**MINERALS AND MINING.** The total mineral production of Alaska in 1909 was about \$20,200,000. The production was almost entirely of gold, the value of which was about \$20,463,000, as

compared with \$19,600,000 in 1908. Of this, the placer production was \$16,322,000, the lode production, including gold derived from copper ores, was \$4,107,363. The largest output was yielded by the Yukon placers. Practically all the Yukon camps made increased production in 1909, those in the Tanana valley leading, with about \$10,150,000. Of this amount the Fairbanks district produced about \$9,650,000. All the placer camps were prosperous except those of Seward Peninsula, where the dry weather curtailed the output. A new discovery of gold placers was made on Otter Creek, the northern tributary of the Haiditarod River in the Innoko Valley. Thousands of prospectors and miners flocked to this district from all parts of the Territory, as well as from points outside. A government survey of the district was under way. The total gold production of Alaska at the close of 1909 was \$162,686,455, of which \$118,219,757 came from placers, and \$44,466,698 from lodes. The record of production begins with 1880.

Mining of copper was less active in 1909 than in 1908. The output for the former year was valued at \$536,211, as compared with \$605,267 in 1908. The low market price of copper prevented several mines from resuming operations, but the building of the railway from Cordova to the Chitina region and its prospect of early opening to traffic will cause a large increase in the copper production. The ores of this region are of exceptionally high grade. The total production in pounds in 1909 was 4,124,705. Among other minerals, tin, gypsum and marble were also produced in small quantities.

The gold fields of Alaska, largely on account of the place that they occupy in the field of politics, have been much in the public mind in 1909-10. The political aspects will be found under the article PUBLIC LANDS and the article UNITED STATES, paragraph Administration. The principal coal fields of the Territory remained idle during the year 1910 because of the inability of claimants to secure title. The long delay in the issuance of patents to coal lands and the popular clamor against all Alaskan coal claimants has discouraged claimants and investors so that not only was there no industrial advance in the mining of coal, but in some regions there was a decided retrogression. The coal is widely distributed in Alaska, but the only fields which can yield coal for export are those in the Pacific slope province. The coal in these fields includes the lignitic or bituminous coals of southeastern Alaska, Cook Inlet, the Susitna basin and the Alaska Peninsula, as well as the high grade fuels of the Bering River and the Matanuska fields. About 40 per cent. both of the area known to be underlain by coal and of the estimated area of all the coal fields of the Territory, falls in this province. It includes also at least 90 per cent. of the known bituminous and higher grade coals of the Territory. Coal is also found in the central provinces and in northern Alaska, although the extensive deposits in the latter region are too remote to have any present importance and must be regarded simply as a part of the ultimate fuel resources of the world. Two influences have held back the development of the Bering River and Matanuska fields. One has been the advancement made in the California oil districts, and the other the unfortunate conditions existing in regard to the laws under which Alaska coal lands can be taken up. The latter is by far the more serious of these obstacles. According to

the estimates of the Geological Survey, the marketable Alaska coals of the Pacific slope amount to fifty or sixty billion tons, worth in the ground about half a cent a ton.

**TRANSPORTATION.** Only one of the railway projects of the Territory made any progress in actual construction during 1910. The outlook for extensive railway building in developing the general resources has not improved since 1909. The Alaska Central Railway, which in 1909 extended its track to miles 75, on the projected route from Resurrection Bay to the Matanuska coal fields and to some favorable points on the Tanana River, was sold under the order of the district court, and is now incorporated as the Alaska Northern Railway. No new construction was done on this line during the year. The construction of the Copper River and Northwestern Railway, which is building a narrow-gauge road through the lower valley of the Copper River into the Chitina region, was continued up to December, 1909, when the weather became too severe. Work was continued in the spring of 1910 and about 101 miles of track have been completed. By September 25, 1910, trains were in operation from Cordova, the tide-water terminal, to Chitina, a distance of 131 miles. The continuation of the present prosperity of the mining industry in Alaska is dependent on the cheapening of operating costs by the improvements in means of transportation. The present industrial advancement of inland Alaska is small as compared with that which will take place when railway communication with the tide-water has been established. There are now about 370 miles of railways distributed among nine different systems.

The construction of wagon roads and trails progressed steadily during the year. The benefits derived from these methods of transportation have been so generally appreciated that the available funds have been found too small to meet the popular demand for more roads.

**COMMERCE.** The shipments of domestic merchandise from the States to Alaska in the fiscal year 1910 were larger than in any prior year, the increase being due in some measure to activity in railway construction in the Copper River Valley. The commercial movement from Alaska to the States, including gold and silver of domestic production, was larger than in any other year except 1909. The total value of the merchandise shipped from the United States to the Territory in 1910 was \$17,972,647, of which hardware and machinery were valued at \$5,709,558; provisions, \$5,930,196; lumber, \$527,053; liquors, \$654,821; and coal, \$208,359. The value of the merchandise and precious metals shipped from Alaska to the United States in 1910 was \$34,628,535, as compared with \$34,335,435 in 1909. Of this amount the gold shipped was valued at \$18,393,128 and the merchandise, including fish and furs, was valued at \$12,349,462.

**FISHERIES.** Next to mining, the fishing industry is the most productive of the Territory. There are employed in this industry about 13,000 persons, of whom about 3000 are natives. The investment, exclusive of cash capital, amounted to about \$10,000,000, and the export value of the product to about \$12,000,000. The most important of the fisheries is the salmon and the yield of 1910 was highly profitable, owing to the advance in value of all grades of salmon. The total pack of the canneries amounted to about 2,375,000 cases of four dozen 1-lb. cans each.

This was valued at \$9,434,946. The value of the other fish exported, including halibut, cod and herring was \$869,861. Whalebone was exported to the value of \$136,520.

**NATIONAL FORESTS.** During 1910 steps were taken toward the further adaptation of the Forest Service administration to local conditions in Alaska. Provision has been made for scaling forest reserve timber at the mill instead of at the place of cutting, thus obviating delays which under the former system were vexatious. The amount of timber cut from the reserves during the fiscal year 1910 was 15,471,000 board feet, which probably represents about half the amount cut in all of Alaska, including wood used as fuel. The receipts of the Forest Service in the Territory were \$19,502.

**FURS.** The value of the furs exported during the fiscal year 1910 was \$574,764, which was an increase over the value of the product of 1909, which was \$537,162. The 61st Congress at its second session passed an important measure relating to the seal fisheries of Alaska. Under this enactment the Secretary of Commerce and Labor has power to authorize the killing of fur seals and the taking of seal skins on the Pribilof Islands in Alaska. New regulations shall be issued by him prescribing the manner in which such killing shall be done and limiting the number of seals to be killed whenever he shall determine that such killing is necessary or desirable, and not inconsistent with the preservation of the seal herd. This act also provides that no person shall kill any otter, mink, marten, sable or fur seal or other fur-bearing animal within the limits of Alaska Territory, or in the waters thereof, under penalty of a fine of not less than \$200, nor more than \$1000, or imprisonment of not more than six months, or both. The vessels and equipment engaged in violation of this section shall be forfeited. The Secretary of Commerce and Labor has power to authorize the killing of any such fur-bearing animals under such regulations as he shall prescribe. Fur-bearing animals enumerated below may be hunted and killed in the Territory of Alaska, except during the season specified with respect to each of them:

Sea otter: The hunting or killing of sea otter is prohibited until November 1, 1920.

Beaver: The hunting or killing of beaver is prohibited prior to November 1, 1915.

The hunting or killing of land otter, mink, musk-rat, marten, fisher and ermine is prohibited throughout the season from April 1 to October 31 of each year.

The hunting and killing of black bear is prohibited throughout the season from April 1 to July 31.

The hunting or killing of fox, wildcat or lynx is prohibited throughout the season from April 1 to September 30.

Permits or licenses may be issued by the Secretary of Commerce and Labor for the taking of fur-bearing animals for scientific purposes and for shipment to zoological parks.

**EDUCATION.** During the year 1910 steady improvement was made in the public school system of the Territory, in the schools provided both for white children and for native children. White schools supported by local license moneys and taxes are maintained in the incorporated towns as follows: Chena, Cordova, Douglas, Eagle, Fairbanks, Haines, Juneau, Ketchikan, Nome, Petersburg, Skagway, Valdez and Wrangell. Three new white schools were established during the year in settlements other than incorporated

towns. The number of these schools is now 21. In the schools in the incorporated towns there were during the year 621 pupils. The cost of maintaining these schools was \$36,486. Improvement has been made in the means and methods of educating the native inhabitants, a work which is being carried on by four local superintendents and a corps of teachers under the direction of the Commissioner of Education at Washington. The number of native schools was increased during the year from 69 to 75.

**INDIANS.** The condition of the Indians of Alaska has greatly improved in the last few years. This is due to a number of reasons, among which are the reindeer industry, marked improvement in the means and methods of instruction in the schools, and the enforcement of a new law further penalizing the sale of intoxicating liquors to natives. The development of the reindeer industry for the benefit of the Eskimo inhabitants has been carried forward with marked success. In 1910 the number of the reindeer exceeded 26,000 in 39 herds. The Eskimo becomes the absolute owner of reindeer only after he has served an apprenticeship of five years and proven his efficiency and fidelity. The civilizing effect of the reindeer industry among the Eskimos, who are naturally a people of ready intelligence and adaptability has been remarkable. The natives of the southeastern part of the Territory are in many instances industrious and almost always law abiding. Their efficiency in the mines and fisheries is impaired chiefly by the use of liquor, and the enforcement of the act approved February 6, 1909, making whiskey peddling a felony and resulting in many convictions, has had a beneficial effect. Instruction in the manual arts is well adapted to the needs of the native people. The greatest menace to the native people in Alaska is the presence of infectious diseases. The employment of physicians by the Bureau of Education for the treatment of natives and for their instruction in hygiene and sanitation has brought valuable results.

**POLITICS AND GOVERNMENT.** The recommendations made by President Taft in his annual message to Congress in December, 1909, for a plan for an organized system of government for Alaska, unfortunately did not pass through Congress. His recommendations were repeated in the message of December, 1910. The President is of the opinion that Alaska is not yet ready for self government, largely on account of the scattered nature of the population. A further discussion of his recommendations will be found in the paragraphs on *Congress* in the article **UNITED STATES**. In his annual report for 1910 the Governor of Alaska states that in his opinion the following laws are most urgently required for the Territory: A law opening coal lands to development; government aid for railway construction; continued appropriation for wagon roads and trails; aids to navigation; changes in mining laws; registration of vital statistics; sanitation and public health; compulsory school attendance; relief of destitution among white inhabitants; and amendment of the game laws.

In July and August, 1910, the Attorney-General of the United States and the Secretary of Commerce and Labor made a tour through the Territory. Their visit was extremely gratifying to the people.

In April a United States Marshal and District

Attorney were dismissed by President Taft for incompetency.

Investigations were carried on during the year of alleged attempts at conspiracy to defraud the government by unlawful acquisition of coal lands in Alaska, and on October 15, seven men, residents of Seattle and British Columbia, were indicted on this charge. These men were in two groups, one led by C. F. Mundy and Algernon F. Strachey, and the other by Cornelius Christopher and George Simmons. It was alleged that the two groups were seeking to acquire by fraudulent entry about 24,000 acres of coal land, valued by the government at \$100,000,000. This coal land is in the Bering River coal fields, in which also is the land covered by the Cunningham claims. On November 3, these men were indicted by the Federal grand jury at Spokane, Washington, charged with conspiracy to defraud the government out of more than 20,000 acres of coal lands in Alaska, valued at \$200,000,000. The indicted men were Raymond Brown and William L. Dunn, of Spokane, Charles M. Doughton, Harry White, formerly Mayor of Seattle, Charles A. McKenzie, of Seattle, and Donald A. McKenzie, of Washington and Alaska. The charges were that the indicted men had agreements with 131 men who took up claims of 160 acres each in Karak, the mining district of Alaska, whereby they were to get a half interest in this land.

**OFFICERS:** Governor, Walter E. Clark; Secretary to the Governor, William H. Loller; ex-officio Secretary of Alaska, William L. Distin; Delegate to Congress, James Wickersham.

**JUDICIARY:** First Division: Thomas R. Lyons, Juneau; Second Division: C. D. Murane, Nome; Third Division: Edward E. Cushman, Valdez, Fourth Division: P. D. Overfield, Fairbanks.

**ALBANO, ELIAS FERNANDEZ.** See **NECROLOGY**.

**ALBAUGH, JOHN W.** See **NECROLOGY**.

**ALBERT I.** See **BELGIUM**.

**ALBERTA.** A province of Canada (since September 1, 1905). Capital, Edmonton. Area, 253,540 square miles. Population (est., 1910), 321,862. For details, see **CANADA**. The government consists of the Lieutenant-Governor (George H. V. Bulyea in 1910 and since September 1, 1905), who is appointed by the Governor-General of Canada, of the Executive Council (a responsible ministry of four members), and of the unicameral Legislative Assembly (41 members elected for five years). Premier in 1910, A. L. Sifton.

**ALCOHOL.** New and valuable data upon the subject of alcoholism in its relation to heredity and the generative tissues were brought to light during 1910. Clinical experience and statistical evidence have long taught that paternal alcoholism had a harmful effect upon the offspring, and that alcoholism injures the germinative cells. Forel supported this view with statistics from insane asylums and gave the name "*blastophthorie*" to the lesions observed in the germinative cells of alcoholics.

Experiments with animals also indicate that chronic alcoholism in the male leads to the production of defective offspring. In 1898 Simonds, of Hamburg, found that azoospermia characterized 60 per cent. of chronic alcoholics. Now Bertholet, in 39 autopsies on chronic alcoholics under 50 years of age, reports that he found in all but two of these cases chronic degenerative testicular changes quite different from those characteristic of ordinary senile involution; in proportion to the degree of atrophy present, the process of spermatogenesis is defective, a total absence of spermatozoa being often noted.

The subject is viewed from a somewhat different angle by Elderton and Pearson, who examined more than 3600 school children with regard to the addiction or non-addiction of their parents to alcohol. A higher death rate was found among school children who were the offspring of alcoholic parents than among the children of sober parents, and the mortality was higher when the alcoholism was maternal than when it was paternal. It appeared, however, to be due to accidents and gross carelessness on the part of the parents, rather than to transmitted frailty. In average height and weight, the surviving children of alcoholic parentage equalled those of non-alcoholic, and the general health was slightly better. These apparently contradictory observations are explained by the fact that the high death rate of the children of such parents permits only the fitter to survive, and the further fact that the defective children of alcoholics (imbeciles, idiots and insane) are not to be found in the homes of the alcoholic parents, but are confined in public institutions for such defectives. They are not to be found in the schools. Hence Elderton and Pearson's results are of questionable, if of any, value.

The effect of alcohol on large populations is shown in a statistical study of the subject in Austria, where there are eight different nationalities: Germans, Czechs, Italians, Hungarians, Roumanians, Ruthenians, Slavonians, and Poles. The Germans and Italians drink mostly wine and beer, the Hungarians only wine, while the other nationalities consume large amounts of gin, whiskey or brandy. Drinking among women and children is quite common in these races, even babies being fed with diluted spirits. The lower the social standard, the more alcohol consumed. It has been shown that a peasant family will spend 10 to 15 per cent. of their income on drink. The results of these conditions are seen in the recruiting for military service. While 60 per cent. of the Germans, Italians and Hungarians are found physically fit to enter the army, only 35 per cent. of the poorer Slav youths are able to pass muster.

Hultgen in a study of 460 cases of chronic alcoholism tried to determine which of the various bodily tissues or organs was most damaged. Neuropathic and psychopathic lesions were found in 92.5 per cent. of the cases. He says that the nerve cells contain more lipid substances and lecithins than any other cells, and that alcohol exercises a selective narcotic action upon them. Morbid conditions of the nervous system are rarely absent in chronic alcoholism. The next most striking effects of alcohol are seen in the gastro-intestinal system. Pharyngitis, gastritis and hepatic disorders occur in 82.7 per cent. of all cases studied. The lungs and kidneys, on the other hand, contrary to the general belief, he found to suffer very little.

Alcohol did not appear to irritate the kidneys, and only 9.1 per cent. of the cases showed evidence of nephritis, and this is more reasonably attributable to exposure, over-eating and disorders of metabolism. See **INSANITY**.

**WOOD ALCOHOL.** The dangerous properties of methyl alcohol as a drink are well known, and even its vapor when inhaled may damage the eyesight. According to Muller, a German physiologist, pure methyl alcohol is no more poisonous than grain alcohol. If so, it is the impurities developed in its manufacture that furnish the poisonous elements. This probably explains why different specimens of wood alcohol vary in toxicity, and may lead to a method by which the toxic substances can be eliminated during its manufacture. See **CHEMISTRY, INDUSTRIAL**.

**ALDRICH, NELSON WILMARTH.** See **UNITED STATES**, section *Congress*.

**ALDRICH, THOMAS JOSHUA.** See **LITERATURE, ENGLISH AND AMERICAN**.

**ALDRICH-VREELAND CURRENCY ACT.** See **CURRENCY**.

**ALENÇON, FERDINAND PHILIPPE MARIE, Duc d'.** A French nobleman, died June 29, 1910. He was born in 1844 at Neuilly, the second son of Louis, Duc de Nemours, and the grandson of Louis Philippe, King of the French. He was fourth in order of succession to the French throne and was second cousin to the Duc d'Orléans, the French Pretender. In 1868 he married Sophie Herzogin zu Bayern, who died in 1897, leaving him two daughters and a son. The greater portion of his time was spent at his villa at Wimbledon, England.

**ALEXANDER, BOYD.** An English traveller, explorer and naturalist, murdered by natives in the French Congo in May, 1910. He was born in 1873, and was educated at Radley College. He entered the Militia Battalion of the Rifle Brigade in 1893 and was made captain in 1898, after his return from the Cape Verde Islands, to which he had led a scientific expedition. In 1898-9 he was the leader of another expedition which explored the Zambesi River. He was then appointed to the Gold Coast constabulary. In this service he took part in the relief of Kumasi in 1900, and in 1902 was appointed to a commission in the regular Rifle Brigade. In 1904 he returned to the field of exploration and led a scientific expedition to Fernando Po. This expedition succeeded in ascending Mount St. Isabel and discovered many new birds. The following three years he spent with the Alexander-Gosling expedition, which crossed Africa from the Niger to the Nile. The two other leaders of the expedition died, but Alexander continued the work of exploring the upper basin of the Welle and ascended the Kibali. He then led an expedition northward and crossed the Congo-Nile watershed to the Yei. On his return from Africa in 1907 he retired from the army. In the early part of 1909 he explored various islands in the Gulf of Guinea and then continued on to the Kamerun country, ascending to the craters at the summit of the mountains. He was in this region during the earthquake of April, 1909. He received a gold medal from the Royal Geographical Society of Antwerp in 1907, and was made a gold medallist of the Royal Geographical Society of London in 1908. His writings include the results of his African trips. *From the Niger to the Nile*, in two volumes, "Birds of Kent" in

the *Victoria History of England*, and many papers in scientific journals.

**ALEXANDER, EBEN.** An American educator and diplomat, died March 11, 1910. He was born in Knoxville, Tenn., in 1851, and graduated from Yale College in 1873. From 1873 to 1876 he was instructor and professor of ancient languages in the University of Tennessee, and from 1886 to 1893 was professor of Greek at the University of North Carolina. In 1900 he became Dean of the University. From 1893 to 1897 he was United States Minister to Greece, Rumania and Servia.

**ALEXANDER, H. B.** See LITERATURE, ENGLISH AND AMERICAN, section *Poetry and Drama*.

**ALEXANDER, SAMUEL.** An American surgeon, died November 29, 1910. He was born in New York City in 1858 and graduated from Princeton College in 1879. He studied medicine in Bellevue Medical College, graduating in 1882. In the following year he studied abroad at London, Leipzig and Vienna. Upon his return to the United States he was appointed attending surgeon at Bellevue Hospital, and he remained connected with that hospital until the time of his death. He held professorships in Bellevue Hospital Medical College and the Cornell Medical College. He was widely known in scientific circles as a surgeon and writer.

**ALEXIS, NORD.** President of the Republic of Haiti from 1902 to 1908, died May 1, 1910. He was said to have been over one hundred years old at the time of his death, but more probably he was about 90. He was born, according to the best authorities, at Cape Haytien, August 1, 1820, and was the son of Baronet de Nord Alexis, a member of the court of Henri Christophe, who in 1811 called himself King Henry I. of Haiti. At the age of nineteen he became a soldier and was appointed aid to President Pierrot of Haiti, whose daughter he married in 1845. He served several terms as governor of two of the provinces of Haiti. In 1865 he joined a revolution against President Geffrard, which was successful until Cape Haytien, the stronghold of the revolutionists, was bombarded by a British gunboat. Alexis escaped on a United States gunboat to Santo Domingo. Here he and Salnave, the leader of the insurrection, plotted another revolution. In 1867 they returned to Haiti. Salnave proclaimed himself protector of the Republic and in 1869 became dictator, but the people arose and overthrew him, and he was tried and shot. In the provisional government which followed, Alexis was made Minister of War. Five years later he was exiled by one president, but returned within a year, only to be exiled by another. In 1879 he returned to the island during the régime of President Salomon and was twice arrested. In 1888 he took part in the revolution which followed the flight of Salomon, and supported Seide Thélémaque, who aspired to the presidency. Thélémaque was defeated and killed, but Alexis rallied his soldiers and succeeded in gaining a temporary victory over the Salomon faction, headed by President Légitime. Under Presidents Hippolyte and Simon Sam, Nord Alexis served as governor of the north and north-west parishes of the Republic. In 1902 Sam resigned the presidency, and a provisional government was formed. After threatened revolution, Congress demanded Nord Alexis as president, and he was elected by the National Assembly. He was the twentieth ruler of Haiti in one hundred years. Alexis at once began a rule of militarism

and his rule was tyrannical and arbitrary in the extreme. He put down several threatened insurrections with great barbarity, and not until 1908 was effectual resistance made to his rule. A revolutionary army had possession of about half the Republic and was rapidly drawing near the capital, when in December, 1908, the people of Port au Prince suddenly arose, seized the administration buildings and called upon Alexis to come out and be killed. He would have resisted, but the foreign consuls urged surrender, and under the protection of the French Consul he left the palace and embarking on a French vessel, sailed to Kingston, Jamaica, where, with the exception of a short visit to the United States, he remained until the time of his death. Alexis was a striking figure, of great height, with a face intensely black. He was said to have been a believer in voodooism, and to have practiced the savage African rites. He was reputed to have died enormously rich.

**ALEY, ROBERT JUDSON.** See MAINE, UNIVERSITY OF.

**ALFALFA.** The constant increase in the acreage of the alfalfa crop was continued in 1910 and in general good yields were secured. The fact that this crop is well adapted to irrigation and is also much more resistant to drought than most of the grasses grown for hay, saved many localities from hay crop failures. No general statistics regarding the crop exist, but data for some States are available. Kansas had about 1,000,000 acres of alfalfa in 1910 and produced over 2,000,000 tons of alfalfa hay. In Oklahoma the acreage was about 25,000 and the yield about 50,000 tons. Ohio had 23,136 acres distributed through all the counties of the State with an estimated yield of 68,519 tons. In Massachusetts and other New England States the crop is slowly spreading and more successful attempts to grow it were reported this year than heretofore. Alfalfa also made good progress in the south. Farmers in Mississippi met with most encouraging success, and in other Southern States the crop was further introduced and distributed. In most Western States alfalfa mills for grinding alfalfa hay into meal increased in number, and progress was also made during the year in the improvement and the manufacture of machinery for this purpose. The work of the experiment stations and the agricultural colleges continued to point out that alfalfa can be grown successfully in many localities in limestone and other fertile regions, and that the crop as a source of protein is a valuable substitute for the high-priced nitrogenous feeding stuffs. The practice of growing the crop in rows and cultivating it gave much better results than broadcasting the seed. This method finds favor especially on weedy soils in regions of a low rainfall, and in localities where crab grass is a nuisance. Farm experience showed that disking the crop should be done only when the plants are old and have formed heavy crowns. Disking young crops gave injurious results in different parts of the country. More alfalfa hay was fed to hogs than in former years, and the third cutting is preferred for this purpose. The seed of alfalfa demanded a high price, and in some northern alfalfa seed growing sections from 12 to 18 cents per pound was secured on the farm. The alfalfa leaf weevil (*Phytonomus murinus*) which made its appearance in Utah several years ago was found in 1910 to cover the greater portion of several counties. On the acreage of Salt Lake County

this year a loss of 80 per cent. of the first crop, or 6300 tons, was sustained as a result of weevil injury.

**ALGERIA.** A French colony on the northern coast of Africa, which constitutes administratively an integral part of the French Republic. Capital, Algiers.

**AREA, POPULATION, ETC.** Total area, including Northern and Southern Algeria and the Algerian Sahara, is variously estimated at from 343,000 to 393,000 square miles. Population (1906), inclusive of military, 5,231,850 (729,960 Europeans). Marriages (1907), 39,351; births, 155,062; deaths, 104,135; still-births, 2349. Algiers had (1906) 154,049 inhabitants; Oran, 106,517; Constantine, 58,435; Bône, 42,934; Tlemcen, 39,757.

**SCHOOLS** (1907): 1358 primary and infant, with 3489 teachers and 159,581 pupils; Mussulman, 286 (no return of pupils); secondary, 21, with 5802 pupils; normal, 4, with 259 students. There are higher Mussulman schools, and at Algiers a (European) professional college with 1509 students.

**PRODUCTION.** The area under wheat in 1909 was 2,814,000 acres (1908, 3,389,000); yield, 34,769,000 bushels (1908, 29,814,000). The yield in 1910 was officially estimated at 39,371,000 bushels, of which 29,119,000 bushels were durum wheat. Under oats (1908), 3,208,275 acres; barley, 334,768. In 1909, vines covered 309,695 acres, yielding 181,031,820 gallons of wine; under olives, 172,973 acres, yielding (estimate) 6,366,000 gallons of oil. Under forest, 6,156,000 acres (state, 5,300,000). About 93 per cent. of the livestock belongs to the natives. The mines yielded (1907) iron ore, 973,000 metric tons; lead ore, 15,300; zinc ore, 71,000; copper ore, 16,300; total value of output, 21,634,043 francs. Output of phosphates, 373,763 tons (11,216,500 francs). Value of fisheries output (1907), 3,865,730 francs.

**COMMERCE.** The special commerce is given below for four years in thousands of francs:

	1906	1907	1908	1909
Imports	401,700	448,200	449,300	450,800
Exports	280,300	338,500	319,200	329,200

Revised details of exports for 1908 are given as follows: Wine, 72,916,000 francs; animals, 47,309,000; cereals, 39,861,000; olive oil, 16,523,000; cork, 15,365,000; phosphates, 12,246,000; zinc, 10,836,000; fruits, 10,152,000; iron ore, 9,683,000; wool, 7,386,000; esparto, 6,796,000; tobacco, 6,574,000; skins, 6,303,000; vegetables, 5,736,000; fish, 5,660,000. Trade with France (1908) showed imports amounting to 399,008,000 francs, exports 273,967,000; Great Britain, 15,480,000 and 17,789,000; Morocco, 11,873,000 and 5,090,000; Brazil, 7,529,000 and 2000; United States, 5,805,000 and 1,776,000; French possessions, 4,547,000 and 22,001,000. Vessels entered (1908), 4728, of 4,905,713 tons; cleared, 4794, of 5,028,964.

**COMMUNICATIONS.** Railways in operation, December 31, 1909, 3256 kilometres. Length of telegraph lines (1908), 14,690 kilometres; wires, 38,936; telephone lines, 13,924; telegraph offices, 690; post-offices, 635. Algiers is an important coaling station.

**FINANCE AND GOVERNMENT.** The unit of value is the franc, worth 19.3 cents. Revenue and expenditure (1908), 115,186,178 and 108,078,035

francs respectively; 1909 estimate, 127,120,094 and 127,071,518. The estimates for 1910 are 138,895,887 and 138,890,408 francs respectively, detailed as follows:

Rev.	1000 fr.	Expend.	1000 fr.
Taxes	52,706	Debt, etc.	18,437
Domains	7,848	Interior	23,850
Monopolies, etc.	8,640	Native affairs	5,498
Various	2,526	Finance	9,395
Exceptional	600	Posts & Tels.	11,153
D'ordre	26,884	Pub. Works	21,829
Extraordinary	39,692	Agriculture, etc.	8,753
		Various	283
		Extraordinary	39,692
Total	138,896	Total	138,890

For the Southern Territories (1910) revenue and expenditure are estimated at 5,621,094 and 3,613,063 francs respectively. Communal debt (end of 1907), 67,440,036 francs.

Algeria is administered by a governor-general (1910, M. Jonnart), aided by a consultative council. The legislative power rests with the French Chambers.

In February the Chamber voted to provide a battalion of 800 Senegalese riflemen for the Algerian service. At the annual opening of the Algerian Delegations in May, the Governor-General, M. Jonnart, reported the Algerian finances on a sound basis, the receipts being sufficient to meet any expenses that could be foreseen. The home government, however, had in the past charged the country with unexpected expenses and had imposed on it social legislation that entailed financial burdens. This tended to retard the policy of the colonial administration, which sought to place Algeria on an independent financial basis. M. Jonnart declared that the "present régime which purposes to emancipate Algeria and interest her in her own affairs, to accord her the benefit of a needful and advantageous financial decentralization, could not maintain itself and function regularly without the friendly coöperation of the authorities, and an earnest effort on their part to reconcile the national policy to the needs of a new country in process of development."

**AMADOR, MARTIN.** A Colombian public official, died March 13, 1910. He was born in Colombia in 1857, a son of Manuel Amador, President of the Republic of Bolivia from 1867 to 1870. He came to the United States in his youth

and graduated in 1878 from the medical department of the University of New York. After serving for some time as an assistant in the charity hospital on Blackwell's Island, New York City, he became professor of anatomy, physiology and surgery in the University of Cartagena. He was later Consul-General of Colombia in Holland and Belgium, and afterwards Vice-Consul of the United States in Colombia. In 1893 he settled in Brooklyn, N. Y., where he had an extensive medical practice.

**AMES, JAMES BARR.** An American lawyer and educator, died January 8, 1910. He was born in Boston, Mass., in 1846, and graduated from Harvard College in 1868 and from the Harvard Law School in 1872. In 1868-9 he taught in a private school in Boston and in 1871-2 acted as tutor in French and German at Harvard College. In the following year he acted as instructor in history in the same institution. From 1873 to 1877 he was associate professor of law at Harvard and in the latter year was made professor of law. In 1895 he was appointed Dean of the Harvard Law School. He compiled collections of cases on torts, pleading, bills and notes and other legal subjects, and was the author of numerous articles in the *Harvard Law Review* and other reviews.

**AMHERST COLLEGE.** An institution of higher learning at Amherst, Mass., founded in 1821. The attendance in 1910 was 530 and the faculty numbered 48. There were no notable changes made in the faculty during the year and no noteworthy benefactions were received. The total productive funds of the college amounted to about \$2,250,000, and the present income to about \$150,000. There are 90,000 volumes in the library. The President is George Harris, LL. D.

**AMOBY, ROBERT.** American physician, writer and lecturer, died August 27, 1910. He was born in Boston in 1843 and graduated from Harvard College in 1863 and from the Harvard Medical School in 1866. In 1870-71 he was lecturer at Harvard College on the physiological action of drugs. From 1872-75 he was professor of physiology at Bowdoin College. From the latter year until the time of his death he was en-

gaged in the practice of medicine in Boston. He was widely known and quoted as a writer on medical themes, and was the author of several works on physiology and therapeutics.

**ANÆSTHESIA.** GENERAL ANÆSTHESIA: NEW METHODS. Several new methods of inducing general anesthesia were proposed during 1910, having for their object an increase in the safety of the procedure and a diminution of the amount of anæsthetic used. Franke applied the Esmarch bandage to the extremities, either the thighs or arms, or both, preliminary to giving chloroform. By this method a considerable portion of the blood is shut off from the influence of the anæsthetic, with the result, he claims, that much smaller amounts were necessary to induce and maintain sleep than by the ordinary methods. The patients were anæsthetized without any phase of agitation, respirations were regular and there was no cyanosis, salivation nor vomiting. The pulse was somewhat disturbed on removing the bandages. The return of the blood, laden with carbon dioxide, acted as a stimulant to respiration, and the patient returned to consciousness in less than ten minutes after suspension of the anæsthetic. It is necessary that the limbs be free from varicose veins and eczema. The method is not entirely without the possibility of unpleasant complications. Seven out of seventy-five cases anæsthetized in this way developed thrombosis of the veins of the bandaged limbs, in the experience of Grüfenberg.

Chloroform was administered intravenously by Giani at Durante's clinic in Rome. The injection was made into the saphenous vein (in the thigh). Normal salt solution, saturated with chloroform, was used. Eleven hundred c.c., representing 6.6 grams of anæsthetic, were injected in one case. The anæsthesia lasted forty minutes, and seven minutes after the cessation of the infusion the patient awakened. In another case, 1500 c.c., containing about 9 grams of chloroform, were infused during the seventy-five minutes required for the operation. This patient roused in five minutes.

**SPINAL ANÆSTHESIA.** This method continued to excite comment, mostly unfavorable, during the past year. Hohmeier and König, for instance, examined the records of 2400 cases of spinal anæsthesia in 41 well-known institutions. They found that the procedure was responsible for 12 deaths, and that a rather large proportion of the patients suffer, sometimes years later, to an unusual extent from paræsthesias, neuralgia, weakness, headache or vertigo. That grave injury to the central nervous system may be done seems to be settled.

Spiller and Leopold studied the effects of stovain on the spinal cord and the spinal nerve roots, when injected into the medullary canal, as in spinal anæsthesia. Dogs were used in the experiments. They determined that the paralysis occurring after stovain anæsthesia was of the motor type, the anterior spinal nerve roots being affected. Symptoms of ataxia, impaired sensation, and loss of tendon reflexes supervened and became permanent after the third injection. Microscopical study of the spinal tissues showed that a true degeneration of the anterior nerve roots took place, together with certain portions of the cord itself. While the authors would not apply their findings too strictly to man, yet their

experiments indicate that repeated injections of stovain into the same individual might be attended with considerable risk.

**ELECTRIC ANÆSTHESIA.** The induction of general anæsthesia by means of electric currents still remains a fascinating problem. Tait and Ross, of the University of California Hospital, found that they could produce a satisfactory anæsthesia in certain of the lower animals, but that the technical difficulties were many. In dogs, they were able to induce a general loss of sensation without loss of consciousness. These experimenters tried the current on themselves and on others, but in twenty-four trials on human beings they were unable to obtain any phenomena at all resembling sleep. Regional anæsthesia, however, by means of electricity, has proved practicable. Dr. Louise G. Robinovitch produced total anæsthesia of the lower extremities in an individual in whom it was necessary to amputate the toes for gangrene. She used a storage battery. Electrodes were placed over the nerves supplying the tissues to be anæsthetized. The negative electrode was applied over the base of the spine (sacrum) and three positive electrodes were placed respectively over the anterior crural, anterior tibial and posterior crural nerves. Two meters, one for voltage and one for amperage, were employed. The meters registered 54 volts and 4 milliamperes respectively, and the current was interrupted 6000 to 7000 times per minute. Anæsthesia was complete at the moment of applying the current, and lasted 45 minutes.

**ANDREW, A. PIATT.** See **CENTRAL BANK.**

**ANDREWS, WESLEY R.** An American politician, died February 5, 1910. He was born in Warren county, Pa., in 1837. In the campaign of 1856, before he had reached his majority, he organized the John C. Frémont Marching Club. At that time he was living in Jamestown, N. Y. He served during the Civil War in a New York regiment, and at its close he engaged in business in New York City. Removing to Meadville, Pa., he established the *Meadville Tribune-Republican*. He became affiliated with Matthew S. Quay, and when the latter was elected chairman of the Republican State Committee, he selected Mr. Andrews as the committee's secretary. In 1905 he was elected chairman of this committee and held that position up to the time of his death. He had great ability as a political organizer and under his control the Pennsylvania State organization conducted its successful campaigns.

**ANGOLA.** A Portuguese colony in western Africa. It has an estimated area of 500,000 square miles, and is divided into six districts: Congo, Loanda, Benguella, Mossamedes, Huilla, and Lunda. The population is estimated at from three to four millions. Capital, St. Paul de Loanda; other important towns, Cabinda, Ambriz, Novo Redondo, Benguella, Mossamedes, and Port Alexander. There are about 2400 pupils in the several schools, and various missions have been established. Coffee, rubber (in diminishing quantities), wax, sugar, vegetable oils, cocoanuts, ivory, oxen, and fish are the principal products. Malachite, copper, iron, petroleum, salt, and gold are found; and asphalt is

worked by a British syndicate. Imports (chiefly textiles) for 1908 were valued (exclusive of Congo) at 5,137,219 milreis (1 milreis=\$1.08); exports, 3,730,463 milreis. On March 31, 1909, the total length of railways open for traffic was 510 miles; 127 miles of the new line from Lobito Bay to connect with the Central African system have been completed. In 1907 there were 1940 miles of telegraph lines, 63 offices and 122 post-offices. In 1908 there entered at the various ports 1741 vessels of 1,005,004 tons. The revenue and expenditure for 1909-10 were estimated at 2,528,609 and 3,678,344 milreis respectively. The colony is under a Governor-General (1910, Lieutenant-Colonel Alves Roçadas).

**ANKYLOSTOMIASIS.** See **HOOKWORM DISEASE.**

**ANNAM.** A French protectorate in French Indo-China (q. v.). Area, 61,718 square miles. Estimated population (Annamites in the towns and coast regions, Moïs in the hills) in 1909, 7,994,425. The capital is Hué, with 65,000 inhabitants. Confucianism is the popular religion; there are some Buddhists, and 420,000 Roman Catholics. There were (1909) six schools for Europeans (with 86 pupils), 26 official (1568) and 20 other (875) Franco-Annamite schools, and 90 official native schools (14,653). Paddy, rice, corn, cotton, coffee, timber, rubber, cardamoms, betel, tobacco, etc., are grown; the mines produce kaolin, coal, lead, zinc, copper, iron, gold and silver. Raw silk is produced. The trade is included with that of French Indo-China (q. v.). In 1910 there were in operation 511 kilometers of railway. Telegraphs and cables connect with Saigon and Hanoi. The annual budget balances at about 3,000,000 dollars. Annam has no debt. The collective provincial budgets balance at about 700,000 dollars annually. The king, Duy-Tan (born 1899; succeeded September 9, 1907) is under the control of a council of regency. French resident-superior (1910), J. H. Groleau.

**ANTHROPOLOGY AND ETHNOLOGY.** Anthropological activity during 1910 is characterized by the peaceful continuation of the intensive specialist studies begun in previous years. In physical anthropology there have been no discoveries or early human remains comparable to those of the past two years, but many theoretical discussions of the significance of these finds from an evolutionary point of view.

**OPPOSING SCHOOLS.** In ethnology, aside from the ever increasing contributions to descriptive ethnography, there continues the struggle between the classical English school, which insists on the formulation of general laws of cultural development and what might be called the "historical" school of American and German ethnologists, who conceive the development of culture as a series of unique historical happenings which must be studied with regard to their specific settings and are not amenable to generalized treatment. While the latter point of view seems dominant among professional students of ethnology, precisely the reverse holds true for the numerous sociologists, philosophers, economists and historians nowadays more or less intensively

occupied with the interpretation of ethnological data.

**TOTEMISM.** A clash of these antagonistic tendencies has occurred during the past year in the treatment of one of the subjects that has for many years most actively stimulated discussion in anthropological and sociological circles. While the traditional evolutionary standpoint is assumed by Frazer throughout his recent *Totemism and Exogamy*, the opposite method is followed by Goldenweiser in his *Totemism, an Analytical Study*. In two important conclusions, indeed, these authors coincide: both minimize the religious factor of totemism, and accordingly the part played by totemism in the development of religion; and both consider exogamy as essentially distinct from totemism. In the positive interpretation of totemism, however, there is a fundamental disagreement. Frazer conceives totemic phenomena as essentially the same the world over, and bases a general theory of their origin on the beliefs of the Central Australian natives, these being in his opinion the most primitive of living peoples. The Central Australians believe that natural features at different localities within their territory are haunted by the spirits of people belonging to one particular totem group, the totems varying with the locality. If a woman feels the first signs of approaching maternity in a certain locality, the belief is that one of the spirits dwelling therein has entered her body and will be reborn as a child. Frazer contends that this phase of totemism was antedated by a still more primitive stage at which people believed that the stone, plant or animal totem itself (not merely the spirit having such a totem) had entered the mother's body and was reborn in human form. This "conceptional" theory would explain that identification of totemites with their totems which constitutes the essence of the institution, and all such elements as the taboo against the killing of the totem, or the belief in descent from the totem would be naturally derived from the physiological theory as to the nature of conception held by primitive man. While Frazer thus reduces totemism to a single primitive form, Goldenweiser views totemic phenomena as the result of convergent lines of social evolution. A comparison of two typical totemic areas, British Columbia and Australia, brings out the fact that there is a fundamental difference between the totemic systems of these regions. Features which have acquired a predominating influence in Australia, such as the magical ceremonies for the multiplication of the totems, are found wanting in British Columbia; on the other hand, the extraordinary development of totemic art on the coast of Northwest America has no parallel in Australian conditions. A wider survey shows that the several traits ordinarily looked upon as distinctive of totemism are found the world over, both dissociated from other totemic features and combined with one another in many different ways. That is to say, the totemic complex does not conform to a single type, but is an extremely unstable combination of elements. It becomes clear then that if the concept "totemism" is to retain any usefulness it cannot be defined in terms of the symptoms or criteria ordinarily assumed, but must be considered as indicating a process rather than a fixed institution. Goldenweiser accordingly arrives at the conclusion that totemism is the association of a definite social group with objects or symbols of emo-

tional value, the perpetuation of this relationship being effected by descent. See also below in paragraphs under *Asia and Oceania*.

**SOMATOLOGY.** Considerable interest was aroused in biological circles by Boas's preliminary report on the changes in bodily form of descendants of immigrants. Contrary to the hitherto accepted doctrine of the permanence of physical traits, and more particularly of the cephalic index, it would now appear that children of immigrants vary very considerably from the ancestral type. The skulls of East European Jews have an index of 84; that of their American-born children is 81. On the other hand, the index of native Sicilians is 78, while that of their American-born children is 80. This does not establish, as popular misrepresentations of these investigations would lead one to suppose, a mystical tendency to the formation of a unified "American" race, but simply confirms the suggestion previously made that certain traits of supposedly high classificatory value, owing to their imperfect stability, can no longer be viewed in this light.

A suggestive treatment of the Pygmy problem has been undertaken by Father Schmidt. Schmidt distinguishes the genuine Pygmies—brachycephalic tribes with frizzy hair and a stature falling below 150 cm.—from dolichocephalic wavy-haired peoples of slightly taller stature, such as the Veddahs and Senoi, whom he classes as "Pygmoids." The Pygmy race accordingly includes only the Negritoes, Andamanese and Semang in Asia, and the Central African Pygmies and Bushmen of the Dark Continent. These genuine Pygmies, according to Schmidt, form a single somatological type, which can be connected with earlier ontogenetic stages of human development than the Neanderthaloid forms; they are the descendants of the common ancestors of all the taller human types. This biological argument is supported by the ethnological consideration that the Pygmies, lacking even the cultural acquisitions of the Australians, must be considered as the owners of the very oldest cultural elements. These views have been in part overthrown. Schwalbe has pointed out that the African Pygmies are mesocephalic and dolichocephalic and the Bushmen dolichocephalic. To this writer the Pygmies do not seem to form a uniform race, but are merely local sports in point of stature and otherwise closely related with their taller neighbors. Most important of all, the great geological antiquity of the Neanderthal race and its greater affinity with ape forms leaves no doubt as to its occupying a lower position in the genealogical tree of humanity.

Berry, Robertson, and Cross have coöperated in a biometrical examination of Australian and Tasmanian skulls, the two former having also discovered and published dioptrographic tracings of 42 hitherto undescribed Tasmanian skulls and thus very materially increased our craniological data on this now extinct race. One principal result of this investigation is that the Australian skulls are less homogeneous than the Tasmanian ones, though more so than those of the Papuans. That is to say, the Tasmanians seem to constitute a relatively pure race, while the Papuans are the least pure of the three races considered. An equally suggestive line of inquiry was followed in comparing and grading with regard to phylogenetic rank the calvaria of the Tasmanians, anthropoid apes, various low races living and extinct, and of modern Europeans. It appears from the data at hand that the Tas-

manian, while in most measurements nearer to extinct human forms than other recent varieties, nevertheless falls well within the range of variation of *Homo sapiens*, being immeasurably superior to the Spy-Neanderthal type. The very high rank given to the Cannstadt skull according to these recent measurements is wholly in accord with the purely morphological estimate of these remains by Schwalbe and other authorities. *Pithecanthropus erectus* appears to be, as has also been previously contended, a transitional form distinctly nearer the anthropoid apes than to the Neanderthal type.

**AMERICAN LANGUAGES.** Parts of the first volume of the *Handbook of American Languages* have at last been issued from the government press. The Introduction by the editor, Professor Franz Boas, contains some important observations on the philosophy of language and the relation of linguistics to ethnology. While classifications of mankind have hitherto attempted to take into account physical, cultural and linguistic features at the same time, the work of the past decades has made it clear that such mixed classifications are futile. Race, language and culture develop independently of one another and a useful classification of mankind can be made only by each of these factors taken singly. Many quasi-problems disappear when this fact is fully understood; thus, the so-called Aryan question could never have been broached had the disputants recognized that there is no necessary correlation between race, speech, and culture. Language serves to express an infinitude of concrete experiences, but with a limited number of phonetic complexes. That is to say, it economizes the effort required in speech communication by classifying experiences from certain points of view. The categories thus established depend largely on the special interests of each people, and are accordingly distinctive of the several languages, or linguistic families. While in written languages the single word seems a sufficiently definite unit of speech, this does not hold for the languages of uncivilized tribes, where the interpretation of a sound, or series of sounds, as a distinct word frequently depends merely on its phonetic strength. The line between stem and affix is also often hard to draw; thus, in Algonkin dialects almost all verbs consist of several elements in conjunction, each in a definite position, but each group so numerous that it would be arbitrary to consider the one as stems and the other as affixes. In the matter of grammatical categories, it is interesting to note that modes of classification are quite different in North American languages from those employed in Indo-European speech. Thus, the Eskimo do not classify their nouns at all, while the Algonkin classify them not on the basis of sex gender, but as names of animate or inanimate objects, respectively. The idea of number is frequently not clearly expressed, though in some cases there is not only a plural, but also a dual, and even trial, number. Nominal cases are very rare, though case-relationship is sometimes expressed in the pronoun. Verbal categories also may differ widely in Indian tongues from those familiar to the student of European languages; sometimes there is but a single mood or tense, on the other hand there occur in other languages delicate differentiations in the expression of time and mode, such as tenses denoting the beginning or duration of an act. It has often been contended that Indians (and other

primitive peoples) are unable to form abstract concepts because of the lack of abstract terms in their speech. Boas shows that this conclusion is fallacious, inasmuch as Indians readily form abstract ideas and corresponding terms when the necessity arises; their apparent rarity is due to the fact that in ordinary Indian life such terms are not required. The relation of linguistic to other ethnological phenomena is of the greatest importance. Boas finds that both have developed unconsciously, but differ in that the categories of language hardly ever rise into the consciousness of the speakers while religious and social phenomena become the subject of conscious reflexion and interpretation. American languages have usually been defined as *polysynthetic*, i. e., as uniting by grammatical processes a large number of distinct ideas into a single word, and also as incorporating the object in the verb. Boas shows that the latter tendency is but weakly developed in the majority of North American languages, while polysynthesis is indeed very highly developed in Eskimo and Tsimshian speech, but is in other stocks reduced to a minimum. However, other traits appear, which, while not absolutely universal, nevertheless hold for many of the Indian linguistic families. Most important among these is the tendency to divide verbs into an active and a neutral group, these being distinguished by association with distinct sets of pronouns.

**BLACKFOOT CULTURE.** Wissler has taken up the question of the early habitat of the Blackfoot and the problems connected with their material culture. Contrary to Grinnell, he finds no evidence that the Blackfoot ever occupied other territory than their historic habitat in the northwesternmost part of the Plains area. Culturally, there is little in the material side of Blackfoot life to differentiate them from their neighbors of the Plains. Thus, nearly all their food habits are shared by the tribes of the Saskatchewan and Upper Missouri; it is only in a few utensil forms that they evince some individuality, while owing to their marginal position they have adopted some culinary methods from the inhabitants of the Plateau region. In dressing skins the Blackfoot likewise fall in line with other buffalo-hunting peoples, using such typical implements as the adze-shaped scraper and rubbing skins over twisted cords in the way peculiar to this geographical group. In transportation the Blackfoot use two types of travois, both the one with a netted hoop employed by the Dakota and Assiniboiné, and the form with a rectangular frame found among the Plains Cree, Gros Ventre, Arapaho and Sarcee. The form of their cradles allies the Blackfoot with their western neighbors, the Shoshone and Nez Percé. The Blackfoot resemble the Crow, Hidatsa, Sarcee, and Comanche in erecting their lodges on a foundation of four poles, while the other Plains tribes use three. A comparative discussion of Blackfoot clothing leads to the interesting result that the men's shirt was not used as an everyday garment throughout the Plains area, though as a dress shirt for gala occasions its use was general during the historic period. The wearing of shirts for ordinary costume occurs among the northwestern Plains tribes, some Shoshone and Salish, as well as among the Cree and eastern Dene, so that this custom may be reasonably regarded as a northern characteristic. Like several other tribes of the Plains, the Blackfoot employed a sinew-backed bow. The latter, however, is dis-

tinctive of the tribes to the West and must be regarded as intrusive wherever it occurs east of the Rocky Mountains.

**INDIAN AGRICULTURE.** The hitherto little-noticed subject of Indian agriculture has been discussed by Parker with special reference to the Iroquois use of maize. On the basis of modern botanical and archaeological investigations, Parker is able to refute the opinions occasionally expressed as to the non-American origin of Indian corn. Maize proves to be a development of a Mexican grass known as teosinte (*Euchlaena mexicana* Schrad.); a sport of this plant, by crossing with its normal ancestor, probably gave rise to our cultivated variety. The claim of the Indian race to having contributed this important cereal to the foodstock of the Old World civilization is thus vindicated. So far as the Iroquois methods of cultivation are concerned, the first step was to clear the land by girdling the trees to make them die and burning the underbrush. Certain fields were reserved for the use of the nation, but others were owned by individuals, whose plots were marked by posts painted with the owner's clan totem and individual name sign. For cultivation of the communal fields the women of each settlement elected a chief matron, who planned all the processes of planting, cultivation, and harvesting. In preparing the soil a hoe was used, the blade being of bone, antler, or wood. At planting time each community celebrated a thanksgiving festival accompanied by prayers and sacrifices. After the harvest in autumn, the maize was carefully stored away, the shelled corn in bark barrels, the braided bunches being hung up inside the houses.

**CULTURE OF THE DIEGUEÑO.** Waterman's researches among the Diegueño of Southern California are important as refuting the erroneous opinion that this Yuman-speaking people is allied in religion and mythology to the surrounding Shoshonean groups. This view is based mainly on the prominence of a cult centering in the use of jimson weed for the purpose of securing a vision. This cult, Waterman shows, has indeed been introduced by the Shoshoneans of California, but its presence among the Diegueño is recent, while the creation myth, the interpretation of large dry-paintings, the symbolism associated with the cardinal directions, and other features connect Diegueño culture with that of other Yuman tribes. The importance of initiation rites for both boys and girls at the time of puberty is very marked, and the annual mourning ceremonies found elsewhere in California are still practised.

**YAKIMA.** Archaeological investigations by Harlan I. Smith in the Yakima Valley established the similarity of the prehistoric culture of this region to that of recent times. The archaeological finds prove to be typical of the Plateau culture area. The strongest affinity of the Yakima sub-area is with the Thompson River region of interior British Columbia, while there is relatively less evidence of contact with prehistoric people of Puget Sound and the Pacific Coast of Washington.

**CENTRAL AND SOUTH AMERICA.** Additional reports of Dr. Lehmann's investigations establish the relationship of the Sumo and Mosquito languages. The Mosquito are great navigators and their cedarwood dugouts seem to connect them with the South American Indians. On the Pacific coast of Central America, favorable natural conditions have promoted the develop-

ment of a higher civilization, than along the Atlantic border. The influence of Mexican culture seems to have extended as far as Nicaragua and the Nicoya Peninsula. The ceramic and metallurgical products of southeastern Costa Rica and Chiriqui are connected with those of Colombia and Peru. This archaeological affinity is confirmed by the linguistic relationship obtaining between Talamancan and neighboring Panaman tongues on the one hand and the Chibcha languages of Colombia on the other. In the large lowland area of Bolivia east of the Andes, pioneer work has been done by Erland Nordenskjöld. In this area the Swedish archaeologist finds a culture practically independent of the Bolivian highland civilization. On the other hand, his ceramic finds seem to indicate a connection with Central America and the northernmost part of South America.

In a final report Professor Saville describes *The Antiquities of Manabi, Ecuador*. As compared with Esmeraldas, the Manabi culture differs in the rarity of stone implements, while the art of sculpture is more highly developed. Moreover, the corral type of house is missing in the province of Esmeraldas. In view of the proximity of Peru, the number of specimens indicating Peruvian origin is very small, proving that the influence of Inca culture on the coastal inhabitants of Manabi was slight. Only in the Island of La Plata, which was used as a place of worship, some foreign material from Peru was found, more particularly specimens of gold and earthenware. The Rio Guapi appears to mark the northern limit of the culture area dealt with by Professor Saville.

Our knowledge of Peruvian textiles has been enlarged by Dr. Schmidt's recent investigations. It appears that the textiles from Pachacamac manufactured during the "Tiahuanaco" period differed fundamentally from those of later times, both in structural technique and the absence of a loom, while they resemble in both respects the textiles of ancient Ica. This relationship between Ica and Tiahuanaco fabrics is accentuated by the exclusively geometrical character of the woven designs on both. The newly discovered weavings from Pachacamac, however, are distinguished by a wholly different style of ornamentation. Realistic scenes are represented either woven into the textiles or painted on plain cotton weavings. Fishermen in boats (*balsas*) form a favorite subject and the prominence of plant motives is especially noteworthy, distinguishing the art of this period and region from that of all others in South America. In some cases the weaver seems to have aimed at the depiction of everyday life, while other compositions suggest mythological motives.

#### AFRICA

**NATIVE CULTURE IN KAMERUN.** In Africa Dr. Ankermann's explorations have, for the first time, shed light on the ethnological conditions in the "grassy" (as opposed to the woodland) districts of Kamerun. Physically, the natives of this area are distinguished by tall stature, fairly well-developed beards, faces of at times approximately North African type, frizzy but rather long hair, permitting elaborate coiffures. Politically, the district is divided into a number of small states of which Bali and Bamum are the most important. Like other negroes, these tribes have a rather complex mythology in which animals play an important part, but the

religious practices seem to be divorced from the mythical heroes and centre in the worship of the ghosts of the deceased. In Bali the chief acts as high-priest, but ceremonial functions are also presided over by religious societies distinguished from one another by specific musical instruments, badges, and paraphernalia. The principal festival is celebrated at the beginning of the dry season and seems to have formerly inaugurated the period of predatory war-expeditions which coincided with this season. Other public ceremonies are intended to promote the growth of the crops. The houses are mostly rectangular in ground-plan, with pyramidal or dome-shaped roofs. Each wife occupies a house of her own, while the head of the family has a separate habitation. Economically, cattle-raising and the chase are entirely subordinated to horticultural pursuits. Pottery is very highly developed; the women manufacture earthen vessels while the men make earthen pipe-bowls. Some of the more highly ornamental ceramic products seem to be patterned on wooden forms manufactured in the same region, wood-carving having also attained a very high degree of perfection. While iron metallurgy is general throughout the region, the art of brass casting is confined to a few localities, the technique being *à la cire perdue*. Linguistically, all the tribes are of Bantu stock, but their speech has been considerably influenced by Sudanese contact. In their culture likewise the tribes of northwestern Kamerun present an intermediate type. Certain traits are derived from the Benue region, and the Bali men wear garments almost identical with the *tobes* of the Hausa. On the other hand, the carving on drinking-horns resembles that of the Bakuba (Congo) so closely as to eliminate the possibility of independent origin, and strangely enough a peculiar form of parrying-stick almost duplicates forms known from East Africa.

**WAREGA.** The Congolese Warega, whose territory extends from the Lualaba to lakes Tanganyika and Kiwu, have been described by Delhaise. Most interesting is the division of both men and women into social castes, entrance into a higher class being essentially dependent upon the wealth of the candidate, who is obliged to undergo a partly religious ceremony. These classes are genuine secret societies and by their activity in public life constitute a check on the chief's authority.

**BAKULIA.** Through Lieutenant Weiss's investigations the hitherto little-visited Bakulia of northern German East Africa have become better known. Owing to the frequent incursions of the Masai, the Bakulia villages are nestled among huge boulders which nearly shut out the view of them completely from the highways; they are further fortified with euphorbia hedges and at times with stone walls. The huts are round in ground-plan and have a separately thatched roof. In many traits the Bakulia ape the Masai, e. g., in the perforation of the ears for the suspension of huge ear-plugs. Economically they are cattle-raisers and agriculturists, the cattle being the humped variety, and the principal crops cultivated are millet and eleusine. Puberty ceremonies, which include surgical operations on both sexes, recall in part those of the Masai.

**THE KIKUYU.** Much new information on the Kikuyu has been placed on record by Mr. and Mrs. Routledge. The Kikuyu are an agricul-

tural Bantu-speaking people in many details influenced by the neighboring Masai. This influence is most clearly seen in their clothing and the forms of their weapons. Many curious customs seem to have been introduced from the same direction. Among these is the drinking of warm blood from living animals and the practice of spitting by way of benediction or for ceremonial purposes. The political organization was formerly extremely loose, the head of the family homestead exercising patriarchal powers. For military purposes a small number of these head-men sometimes united under a common leader. While bachelors' houses occur, they do not appear to correspond strictly to the Masai warriors' kraal. Age-classes, however, are rather prominent, and a formal initiation of boys and girls at the time of adolescence is indispensable. Each age-class is distinguished by certain special modes of dress or decoration; thus, permanent shaving of the head is a mark of old womanhood. The Kikuyu are skilled iron-workers. The ore is secured from a single quarry, where granite rock is broken down by a stream artificially turned from its natural course so as to yield the ferriferous sand. The presence of a single type of bellows—the triangular form of sewed goat skins—is interesting because the Masai also possess the second African form, a block of wood with skin-covered bowl-like depressions.

**BUSHMEN.** Dr. Pösch's studies of the remnants of the Bushmen race establish certain differences between the Bushmen of the Kalahari and their kinsmen in the Cape Colony. The former are more or less mixed with Hottentots and negroes, and their phonetics are distinguished by but four clicks, while the Cape Colony Bushmen speak dialects with six clicks, and differ culturally in the use of feathered arrows and the manufacture of pottery.

#### ASIA AND OCEANIA

**ASIA. PRIMITIVE METALLURGY.** The interesting question of the origin of iron-work has been resumed by Belck. Inasmuch as the accidental and occasional production of iron objects is relatively unimportant for the history of civilization, and because wrought-iron seems to be for many purposes too soft and too flexible to have supplanted the bronze implements of antiquity, Belck reduces the problem essentially to that of the origin of intentional *steel*-manufacture. This, he argues, must be referred to the scriptural Philistines, who imported the technique (which had probably been developed in Crete) into Palestine between the 14th and 13th centuries B. C. Belck is, however, inclined to regard China as a second independent centre for the development of iron-work. On the other hand, he does not assent to von Luschan's theory that African negroes originated the technique. He finds no proof whatever of the contention that these tribes practised metallurgy four or five thousand years ago; the dark-skinned human beings represented on Egyptian monuments as carrying bluish weapons may be meant for the dark-skinned natives of western Arabia and a part of the Sinai Peninsula rather than for negroes, and the blue color may represent certain varieties of bronze rather than iron; but even if von Luschan's contentions were correct, it would not follow that the bearers of iron implements had themselves manufactured the objects they carried.

**SAKAI AND MALAYS.** In eastern and central Sumatra, Moskowsky has studied the Sakai and Malay natives. The Sumatran Sakai seem to him related to the Sakai of the Malay Peninsula and the Veddahs of Ceylon. Somatologically he considers them as intermediate between *Homo primigenius* and modern man; but linguistically and culturally they have become completely assimilated with their Malay neighbors.

**OCEANIA.** A suggestive discussion by von den Steinen of the New Zealand ornaments known as *heitiki* is of considerable interest for the student of comparative art. The *heitiki* are small nephrite carvings of an oddly distorted human figure, which the natives wear on the breast suspended by a neckstring, depositing them with the dead at the first interment and restoring them to the nearest relative at the final burial ceremony. Von den Steinen suggests that these ornaments originated from nephrite adze blades, which were first perforated for use as pendants and at a later stage carved with the figure commonly elaborated by the New Zealanders on house-posts, war-canoes, weapons and implements. The curious inclination of the head to one side and other anomalies in the carving of the *heitiki* thus become intelligible as due to the limitations of the decorative field furnished by the adze blade.

In the Bismarck Archipelago and the Solomon Islands, Dr. Thurnwald has discovered two sub-racial types, which he distinguishes as Solomonians and Mountain Dwellers respectively. The latter, like the Baining of New Britain and certain tribes in the Admiralty Islands, speak a non-Melanesian language. Thurnwald's report is especially interesting with regard to the much-mooted question of totemism. The Solomon Islanders of Buin are divided into exogamous groups named for certain birds. These totems are not considered as ancestors, but as in some way associated with the several clans. Descent of the name is in the maternal line. Totems are not only never killed by the totemites, but it becomes the clansmen's duty to avenge their death; accordingly, all the totem birds are spared throughout Buin as none of the members wish to incur the wrath of their fellow-tribesmen. In Choiseul no such divisions occur; exogamy is of a local character, and seems to be less stringent. Thurnwald has also been able to supplement Parkinson's information with regard to the secret "Ingnet" society of the Gazelle Peninsula. All members are forbidden to eat certain animals, among which are the pig and several species of snake. Each novice receives at his initiation a stone fashioned into the shape of a man or animal. Each of these stones bears a distinctive name, which is shared by its owner. There is a mysterious connection between the stone and its owner; breakage of the former will cause the man's death. Other sacred objects acquired by the Ingnet members are wooden or earthen symbols of the spirits, which are used in magical practices; to secure their aid it is necessary to purchase their magical powers from the owner.

The most important contribution to Oceanian ethnography is Seligmann's *The Melanesians of British New Guinea*. In the area dealt with, the author recognizes two racial types: (1) the relatively tall, dark-skinned, frizzy-haired "Papuan" natives of the Torres Straits, the Fly River, and adjoining regions; (2) the smaller, lighter-colored "Papuo-Melanesians" ranging from Cape Possession to the extremities of the

British territory towards the east. The Papuan is more generally dolichocephalic, his head is higher, and there are prominent brow-ridges. The Papuo-Melanesian has a smaller nose; like the Papuan he is generally distinguished by frizzy hair, but curly and wavy hair is also occasionally found. The Papuo-Melanesians are again sub-divided into a western and an eastern (Massim) group, of which the former is distinguished by a large admixture of Papuan blood and by the number of mutually unrelated Papuan languages spoken by many of the tribes. With regard to all the Papuo-Melanesians, Seligmann agrees with Haddon that their presence is due to an immigration of Melanesians into the island. The clearest cultural difference from the Papuans seems to be the lack of the rigid seclusion ceremonies for adolescent boys. The most characteristic positive trait of the Massim people is a peculiar totem system with matrilineal descent. The members of each clan have not a single totem, but a series of totems, each representing a different class of the animal kingdom, though the bird totem is most prominent. Exogamy is strictly observed and formerly extended to the father's totem group. The relation of the group to their totems was not a distinctly religious one, more regard being commonly shown to the birds distinctive of one's father's clan. Carvings of totems on houses, canoe prows, and lime spatulæ show a noteworthy connection between totemism and art. A peculiar trait is the horror of dead people not belonging to a person's clan, the feeling being emphasized in the case of one's father. The manufacture of large built-up canoes is very distinctive of the Massim District, as is the absence of bows and stone-headed clubs, spears and swords of hard wood being the common weapons. The western Papuo-Melanesians are less uniform than the Massim tribes. Clans occur throughout with paternal descent, and except among the Motu exogamy prevails. Ceremonial structures called *dubu*, which serve as club-houses and council chambers, are very characteristic of this area. In some places they are merely open platforms supported by carved pillars, while in other places they are steeple-topped houses where skull trophies are stored. Wood-carving is the principal form of art industry throughout the region. Seligmann concurs with Haddon in the conviction that the geometrical motives used for decorative purposes originated from naturalistic representations by a process of conventionalization, though this thesis is more clearly established for the Massim District than for the remaining portion of the Papuo-Melanesian territory.

**SOCIETIES AND EXPEDITIONS.** A Congress of Americanists took place in September in the City of Mexico. It was followed by the establishment of an International School of American Archaeology in that city, at which scholars from the United States and Europe have been invited to give courses. Among the first lecturers chosen are Professor Seler of Berlin and Professor Boas of New York. The annual meeting of the American Anthropological Association was held during Christmas week in Providence R. I. The following officers were elected for the coming year: President, J. W. Fewkes; Vice Presidents, Alice C. Fletcher, R. B. Dixon, George B. Gordon, George A. Dorsey; Secretary, George G. MacCurdy; Treasurer, B. T. B. Hyde; Editor

John R. Swanton; Associate Editor, Paul Radin. The American Folk-Lore Society, which met in conjunction with the American Anthropological Association, re-elected the officers of the past year. The American Ethnological Society and the Anthropological Society of Washington have held their meetings in the customary way throughout the year.

The Bureau of American Ethnology supported expeditions in the Southwest (Dr. Fewkes), among the Winnebago (Mr. Radin), and a linguistic survey of eastern and western Algonkin tribes by Dr. Michelson. The Southwest has also been the field of operations of the School of American Archaeology under the direction of Dr. Edgar L. Hewitt, and of the American Museum of Natural History (Drs. Goddard and Spinden). The last-mentioned institution also equipped an expedition to the Crow and Village Indians (Dr. Lowie) and two trips by Mr. Alanson Skinner, one to the Menomini and Winnebago, and the other to the Seminole of Florida. The Field Columbian Museum continued to support Dr. Lewis's investigations in the South Seas and Mr. Cole's researches in the Philippines. Dr. Edward Sapir has been appointed ethnologist of the Geological Survey of Canada, and has paid a preliminary visit to the Nootka of British Columbia. Professor Marshall H. Saville has again visited Ecuador to resume his archaeological explorations as part of the George G. Heye expedition to that region.

**ANTIGUA.** A West Indian island, forming, with Barbuda and Redonda, a presidency of the Leeward Islands (q. v.). It is the seat of government of the colony. Area of Antigua, 108 square miles; of Barbuda and Redonda, 82½. Population (1901) (Antigua, 34,178; Barbuda, 775; Redonda, 120), 35,073. Capital, St. John, with 9262 inhabitants. Births (1908), 1250 (illegitimate, 1873); deaths, 1079; marriages, 165. Primary schools, 30, with 7384 pupils. Cultivated area, 18,475 acres; under sugar-cane, 15,977; cotton, 800. Sugar exported in 1908, 12,516 tons; cotton, 178,100 lbs. Imports, £179,532 (Great Britain, £71,671; British colonies, £30,889; other countries, £73,027; internal trade, £3945). Exports, £183,075 (Great Britain, £20,745; British colonies, £145,637; other countries, £12,724; internal trade, £3969). Tonnage entered and cleared, 722,862. There are 16½ miles of private railways; 200 of good roads. Post-offices, 12. Revenue for the year 1908-9, £51,502; expenditure, £49,964. Public debt, £135,140. St. John is the residence of the governor of the colony (1910, Sir Ernest Bickham Sweet-Escott).

**ANTIMONY.** There was no production of antimony ore in the United States during 1909. There was, however, a considerable quantity of antimonial lead produced as a by-product in the smelting of other metals and in the refining of pig lead by the electrolytic process. Besides the production of antimonial lead, a large quantity of antimony was recovered from various wastes, such as drosses, residues, old type, etc. The total production in 1909 was 1617 short tons, valued at \$252,252.

The imports of antimony and antimony compounds entered for consumption during 1909 amounted to 9,957,956 pounds. This included antimony metal and regulus.

According to the *Engineering and Mining Journal* there was no antimony ore smelted in

the United States, and no production of antimony ore in 1910 except in small lots for sample purposes. According to this authority there is only one manufactory of antimony oxide in the United States. This is at Elyria, Ohio, and operates on Chinese regulus. The oxide has a limited use as a substitute for tin oxide in ceramic and enamel work, selling for 8 cents a pound.

**ANTI-SALOON LEAGUE.** An organization founded in 1893 as the Anti-Saloon League of the District of Columbia, for the purpose of spreading Prohibition sentiment throughout the United States. From this body developed the national organization, which was founded in Washington in 1895, mainly through the efforts of Bishop Wilson of the Methodist Episcopal Church. The purpose of the League is the federation of churches of every name with temperance societies and other organizations opposed to the liquor traffic, and the concentration of these forces against the common enemy. It has no affiliation with political parties and works independently. The work of the League in 1910 will be found noted in the article PROHIBITION. Its official organ is *The American Issue*, published by Ernest H. Cherrington at Westerville, Ohio. It also publishes the *Anti-Saloon League Year Book* annually. The president in 1910 was Luther B. Wilson, and the vice-presidents, representing the different denominations, were as follows: Bishop G. M. Matthews, Rev. Father James M. Cleary, Rev. David J. Burrell, D.D., Rev. F. D. Power, D.D., Rev. W. B. Crumpton, D.D., Judge Charles A. Pollock, Rev. Washington Gladden, D.D., Rev. William L. McEwan, D.D., Rev. J. C. Barr, D.D., Bishop H. C. Morrison, Bishop Samuel P. Spreng.

**ANTITOXIN.** The value of antitoxin is so thoroughly established that its administration is now a routine procedure in diphtheria. Other uses have been discovered for it. Ricard and Micleon cured cases of severe hemorrhage in hemophiliacs by the injection of antitoxin. The remedy was also used locally in dressing bleeding wounds. It appears that antitoxin acts in a similar way to normal human blood serum in these idiopathic hemorrhages and supplies the clotting principle to the serum of "bleeders." See SERUM THERAPY.

**APPLES.** See HORTICULTURE.

**APPROPRIATIONS.** CONGRESSIONAL. See UNITED STATES, section Congress.

**APRICOTS.** See HORTICULTURE.

**AQUEDUCTS.** Important engineering works to supply water to the cities of New York, Los Angeles, Vienna, Manchester, and Liverpool were under construction during 1910 and are described below. Under WATER SUPPLY, etc., will be found discussed various methods of distribution and maintenance and other questions involved in this phase of municipal engineering.

**CATSKILL AQUEDUCT AND NEW YORK CITY.** The year 1910 witnessed further progress on this great undertaking and as the completion of the aqueduct proper may be considered to be reasonably in sight at the end of the year, an outline account of the entire scheme will be given here. The waters of Esopus Creek are to be impounded by the construction of dams that will form a lake 12 miles long and 3 miles wide at the broadest part, containing 130,000,000,000 gallons.

NEW YORK CITY WATER SUPPLY  
MASONRY PORTION OF OLIVE BRIDGE DAM, ASHOKAN RESERVOIR, CATSKILLS

34

From this Ashokan reservoir about 90 miles north of New York City and 9 miles west of the Hudson, the aqueduct is being built in a southerly direction, about 40 miles to the north side of Storm King Mountain; thence in a pressure tunnel under the river to Breakneck Mountain on the east side of the river; thence southerly 40 odd miles to Hill View reservoir, 92 miles from Ashokan. Hill View reservoir is situated 2 miles southeast of Yonkers and one-half mile north of the New York City boundary line. To follow the course outlined above, two large streams must be crossed before the gorge of the Hudson is reached, and beyond that, the mountains interpose barriers requiring several miles of tunnels, in addition to which the line must pass under Croton Lake and the city of Yonkers. Enormous and costly as the undertaking seems, it is justified by the constantly growing needs of New York, and it has been planned with the idea of supplying five hundred million (500,000,000) gallons a day uninterruptedly, regardless of drought or a series of dry years.

There are four characteristic, distinctive types of construction: cut-and-cover, that is, a concrete tunnel built in an excavated trench and covered with rock or earth; grade tunnel, bored through mountains and hills as the name implies, at the same grade or level as the adjacent aqueduct; steel pipe siphon, used to cross narrow valleys where the rock is not sufficiently solid to permit a deep conduit; and pressure tunnel, for carrying the aqueduct under the bed of large streams, rivers, lakes, or any other natural obstacle. Wherever possible, the cut-and-cover form has been used, and when completed there will be 55 miles of this, built of concrete, approximately horse-shoe shape in section, 17 feet 6 inches wide and 17 feet high inside. The exterior is covered with rock and earth and graded to a uniform slope. Of this kind of work, about two-thirds are finished.

*The Grade Tunnels* are numerous, 24 in all, and when finished they will make up 14 miles of the length of the aqueduct. They have somewhat the same section as the first type, 13 feet 4 inches by 17 feet high. The principal tunnels of the line are the Bontisou, through the Shawangunk range, and Moodna, aggregating 9.2 miles, west of the Hudson; while on the east side of the river the longest are Bull Hill, Garrison, Millwood, and Sarles. From 65 to 70 per cent. of these tunnels are bored through, if not finished.

*The Steel Pipe Siphon* has been used in several localities where the aqueduct must be carried under a valley or other barrier, yet where it was impossible to find sufficiently solid rock to allow tunneling. The pipes are made of  $\frac{3}{4}$  inch steel, riveted, lined with concrete 2 inches thick and are from 9 feet to 11 feet inside diameter. Externally, this type of construction is given additional support by a heavy layer of concrete. In order to carry the full capacity of water, three siphons will be placed side by side. There will be at least ten of these.

*Pressure Tunnels*, of which there are seven, are driven through rock at great depth and lined with concrete. They are 14 feet 6 inches diameter in the clear, and connect at each end with a vertical shaft in the adjoining section of the aqueduct. These tunnels are the Rondout, Wallkill, Moodna, Hudson, Breakneck, Croton Lake, and Yonkers, passing under streams and rivers as indicated by the names. The deepest of

these will be that under the Hudson, work on which was not fairly begun in 1910 owing to the delay caused by the difficulty of finding solid rock. A most careful series of borings was made to ascertain the depth at which solid rock might be found below the bed of the river; and it was not until the closing days of the year that it was announced by the engineers in charge of the work that the rock was found to be solid at a depth of 1100 feet below the water level at mean tide. This tunnel, then, will be 3000 feet long, and the assurance of its construction removes the last natural obstacle of any account on the route. The entire length of pressure tunnels on the work will be 17 miles.

At a point less than 30 miles from the city there will be a storage basin of 40,000,000,000 gallons, known as Kensico reservoir, that can be used in emergencies such as interruptions of the supply from Ashokan in the Catskills. About 15 miles farther south the aqueduct terminates in Hill View reservoir, referred to at the beginning of this article. It is of smaller capacity than Kensico, holding only 900,000,000 gallons, and is an equalizing reservoir, supplying the city mains as needed while keeping the flow through the main conduit above it more nearly constant. On the whole length of 92 miles, contracts aggregating more than \$71,000,000 were being worked in 1910, and on the 31st day of December were reported to be 40 per cent. completed. Plans for the pressure tunnel under Manhattan were officially approved in 1910, and it was expected that bids would be called for and contracts let at an early date in 1911. Owing to the difficulties of carrying on deep tunneling work in the midst of city traffic, the date of the ultimate use of Catskill water was a matter of uncertainty.

**LOS ANGELES AQUEDUCT.** Progress on the great Los Angeles aqueduct was rapid during 1910, and William Mulholland, chief engineer, reported that on December 31, 1910, of the 215.48 miles of aqueduct, 121.31 miles had been excavated, of which all but about 24 miles was then ready for use. Actual construction of conduit did not begin until October of 1908, so that the rate of progress can be appreciated. In point of distance the aqueduct at the end of the year was 56.21 per cent. excavated, and in point of expenditure about 79 per cent. completed. With the exception of 4.23 miles of tunnel still to be bored, the remaining distance was straight-away ditch construction which was being accomplished rapidly with steam and electric shovels. For the year 1910 the excavation amounted to 62.13 miles. If this rate of speed can be maintained, the completion of the aqueduct in the summer of 1912, or more than a year in advance of the engineering estimates, seemed an assured fact.

Estimates of cost of aqueduct construction called for an expenditure of \$24,500,000. These estimates were made by a Consulting Board of Engineers who brought in a report on the project December 26, 1906. At the end of 1910 it was found that the final costs would not exceed this amount and judging from the cost of the work then completed, would be somewhat less. With the exception of 10 miles of easy construction in the Antelope Valley, all the work was being done by day labor under the direction of the city's engineers. The amount \$24,500,000 did not provide for the hydro-electric development which was being undertaken under a sepa-

rate bond issue of \$3,500,000 voted in April, 1910, for that purpose.

Primarily the aqueduct was designed and was being built for the domestic water supply of Los Angeles, but the possibilities of electric power, 90,000 kilowatts of which were found available by proper development, made this phase of the project the most important from a financial standpoint.

**MANCHESTER AQUEDUCT.** In addition to that for New York, N. Y., and for Los Angeles, Cal., there were water-supply works in other parts of the world completed or nearly so that merit some attention. Thirlmere, a lake in the north-western part of England, that has supplied the city of Manchester with water for some years, is to be drawn upon to a still greater extent. A 7-foot diameter pipe-line is being constructed, which, when completed, will increase the supply to the city fifty per cent., and it is expected will be available in about two years. This aqueduct is about 85 miles in length.

**LIVERPOOL AQUEDUCT.** The works at Vyrnwy Lake in Wales, for the water supply of Liverpool, and which have been under construction for twenty years, furnishing an increasing quantity as the work progressed, are now finished, and about 65 million gallons a day are available.

**VIENNA AQUEDUCT.** In Austria, a new aqueduct that will supply Vienna with 44 million gallons a day will be finished in a few months. It will bring water from the Styrian Salza, a distance of 102 miles, and is also notable because a large portion of the water-shed is at an elevation of 7000 feet above sea-level. On one portion of the route there is a tunnel 3 miles long, and in another locality the aqueduct had to be carried on a structure 800 feet long and 75 feet high across a valley. There have been used for the undertaking, all told, 140,000 tons of concrete, 33,500 tons of cast iron main, and 2600 tons of cast iron pipe. See also WATER SUPPLY, WATER PURIFICATION, etc.

**ARABIA.** See EXPLORATION, paragraphs on Asia.

**ARBITRAL JUSTICE, COURT OF.** See ARBITRATION, INTERNATIONAL.

**ARBITRATION AND CONCILIATION, INDUSTRIAL. UNITED STATES.** The year 1910 was notable above all others of the decade for the wide-spread uneasiness among the workers. The fundamental cause of this was doubtless the continued rapid increase in the cost of living together with a moderate revival of business prosperity after the depression of 1908. While strikes were also more numerous, there is little doubt that more important labor disputes were settled without resort to industrial war than ever before. Even in many cases where strikes were begun, the trouble was quickly settled by conciliatory intervention before employers, employees or the public had suffered any severe loss. From the view point of the public the most notable instance of the value of conciliatory methods was the settlement of many disputes between the railway companies and their employees. The strike of the switchmen of the northwest was settled under the Erdman Act, in April. The decision, which was a compromise, slightly increased the wages of nearly 8000 men. About the same time, by resort to the provisions of the same Act, the members of the Brotherhood of Locomotive Firemen and Enginemen, numbering 27,000, employed on seventy-one western roads with a total mileage of 190,000,

secured an advance of 12½ per cent. in wages. On December 24, likewise under the mediation of the Commissioner of Labor and the Chairman of the Interstate Commerce Commission, 33,000 engineers belonging to the Brotherhood of Locomotive Engineers, and employed on sixty-one railroads centering at Chicago received an increase of ten and one-third per cent. in their wage scale. This was an average of about \$192 for each man, or a total of \$3,899,000 annually. These are only larger instances of the many which serve to show that the Erdman Act of 1898 is the most important piece of legislation yet enacted in the United States on this subject.

**MOVEMENT FOR COMPULSORY ARBITRATION.** The feeling, however, continues to develop that some plan more compulsory in nature should be provided, especially for public utilities. In Ohio the reign of terror attending the Columbus street-car strike (see STRIKES) led to a demand for compulsory arbitration; but this was found to be prohibited by the State constitution. At Los Angeles also a long trade war leading to plans for a vigilance committee resulted in demands for compulsory arbitration. In various States considerable favor for the plan embodied in the Canadian Industrial Disputes Investigation Act of 1907 was expressed. In California, Special Labor Commissioner Weinstock, after careful investigation of the methods employed in various countries, submitted an exhaustive report in which the Canadian plan was favored. Mr. Weinstock drew the conclusion that a thoroughgoing compulsory arbitration act would be obnoxious to American opinion; but that, with the increasing power of public opinion, the methods of public investigation with complete publicity of all conditions surrounding a dispute would be very effective. The Sub-Committee on Wages and Labor of the Commission on Congestion of Population, appointed by Mayor Gaynor in New York City, held many hearings on this subject and made extensive inquiry. As a result it drew up a plan based on the Canadian Act. This plan provided for an Arbitration Board to be composed of members selected by the employers' associations, by the labor unions, and by disinterested citizens appointed by the Mayor. This Board would have jurisdiction of wages, hours, materials, trade customs, and trade agreements. A bill based on the Canadian Act was presented in the Massachusetts Legislature. It was vigorously opposed by trade unions because they claimed the right to strike suddenly to be essential to their success. The Canadian unions had similarly opposed their law in 1907, but they approved it in 1910.

**RESULTS OF ARBITRATION IN NEW YORK CITY.** One of the most striking instances of the value of arbitration of trade disputes was shown by a summary of the first six years' experience under the plan of arbitration in the building trades in New York City. The agreement supporting this plan is adhered to by thirty-three employers' associations and thirty trade unions. Each of these sends two representatives to a General Arbitration Board. Disputes were forwarded to the secretary and were first handled by the executive committee of twelve, six representing each side; then by the special trade boards established by any employers' association and union; and finally, if necessary, by the general board itself. In six years, 2379

grievances were presented by the unions; of these 1621 were decided favorably to them; 24 were compromised; 494 were decided adversely; 43 were referred to trade boards; and 197 were abandoned. Of 274 grievances presented by employers 191 were decided favorably to them; 43 adversely; 7 were referred to trade boards; and 33 were abandoned. (For bricklayers' strike see STRIKES AND LOCKOUTS.) A summary of existing laws in the United States and elsewhere, and of the various means of avoiding trade wars, is given in *The Annals of the American Academy of Political and Social Science* for July.

**CANADA.** A summary of the results achieved under the Industrial Disputes Investigation Act of 1907 showed that, during the twenty-five years preceding, 97 per cent. of trade disputes had been settled by strikes or lockouts and only three per cent. by conciliation, while during the years since its enactment these percentages have been exactly reversed. During the second year of the law (1909) its resources were used twenty-five times, a satisfactory adjustment being made in twenty-four cases. In 1910 the law was subjected to its severest test by the dispute between the Grand Trunk Pacific Railway Company and its organized employees. The award of the investigation board, made on June 22, was nominally accepted by the company, but in its interpretation of the award the company stretched the terms "forthwith" and "immediate" to mean not earlier than January, 1913. The men then went out on strike (see STRIKES AND LOCKOUTS). This strike, lasting fourteen days, was ended largely through the intervention of the Minister of Labor on terms almost exactly equal to those set down in the award. While, therefore, the methods provided in the Act failed to prevent the strike, the speedy termination of the latter was primarily due to public recognition of the fairness of the award and public resentment at the stubbornness of the company.

**GREAT BRITAIN.** British employers and trade unions have slowly evolved a system of provisions for the peaceful settlement of disputes without much governmental interference. In September there were 262 conciliation and arbitration boards in existence, affecting more than 2,000,000 employees. Most of these provide for joint conferences of representatives of both sides. *Deadlocks* are avoided in more than one-half of these boards by reference to (1) an arbitrator appointed by the Board of Trade, (2) a permanent neutral chairman, (3) an arbitrator or umpire appointed for each special case, or (4) three arbitrators with authoritative decision by a majority. Moreover, many of the 1696 trade agreements, affecting 2,400,000 workers, favor conciliatory methods in settling differences, and provide penalties for sudden strikes or lockouts.

**FRANCE.** Immediately following the settlement of the spectacular strike of the railway employees which threatened great disaster to all lines of public activity, the government began the formulation of a measure to prevent strikes by the employees of public service corporations. On December 22, the text of the government measure was made public. It provided for the formation of a conciliation commission; if this should fail, compulsory arbitration is required. In case the settlement imposed undue expense upon the employing company it

is authorized to reimburse itself by higher charges or other means. The report accompanying the bill pointed out that strikes on public service utilities are crimes against society as now constituted and emphasized the evils of strikes in general. It declared that some means, however, must be provided whereby employees may secure an amelioration of their condition. Such means were found in arbitration and conciliation. The report also contained a review of the methods of arbitration and conciliation in different countries.

**NEW ZEALAND.** For thirteen years New Zealand was free from strikes; then in 1907 and 1908 it had four. These led to the new law of October, 1908, creating Councils of Conciliation in the various industrial districts, with final appeal to the Court of Arbitration. These Councils and the Court may prescribe minimum wages, give preference to trade unions, and make their awards applicable to all similar trades in a district, or even in the entire country. Reasons advanced for the success of the principle of compulsory arbitration in preventing strikes are that the decisions have been almost uniformly favorable to the unions; that the country has been prosperous; that population increases slowly and there has been no redundancy of labor; and that the plan of fostering trade unions has helped by centering labor class responsibility upon them, while at the same time opening them to all possible members and making their funds liable in case of strike. A report of the New Zealand Employers' Association in October declared that the demands of the unions were becoming more and more extreme and that there were indications that the stronger unions were adopting aggressive attitudes that would lead to the old order of trade disputes.

**ARBITRATION, INTERNATIONAL.** **THE FISHERIES AWARD.** The cause of international arbitration has been greatly strengthened during the year 1910 because of the successful termination before The Hague of the difficult and complicated century-long dispute between the United States and Great Britain concerning the North Atlantic Fisheries, and the prompt acceptance of the decision by the parties contestant. In fact, the case was unique because both parties to it were satisfied with the award. Counting the judges, senior and junior counsel, attorneys, secretaries, clerks and assistants of every grade, thirty-five persons were concerned in the case. The judges were five in number. The president of the tribunal was Dr. Heinrich Lammasch, an eminent Austrian publicist, who holds a professorship in the University of Vienna and is a member of the upper house of the Austrian Parliament. He bears no title, but was designated in the official record simply as Mr. Lammasch. Next in order of precedence in the protocol or bulletin of the proceedings came His Excellency, A. F. de Savornin Lohman, former Minister of State of the Netherlands and member of the second legislative chamber in that country. The third arbitrator was the Hon. George Gray, of Delaware, of the United States Circuit Court of Appeals. Canada was represented on the tribunal by Sir Charles Fitzpatrick, the Chief Justice of the Dominion Supreme Court. The fifth judge was Luis Maria Drago, formerly Minister of Foreign Affairs in the Argentine Republic, probably the most distinguished jurist that South America has so

far produced. The leading counsel on the American side was Senator Elihu Root, of New York, formerly Secretary of State. The leading counsel for Great Britain was Sir William S. Robson, the Attorney-General of England. An immense amount of documentary evidence was submitted.

Many of the documents antedated the American Revolution, and some of them went as far back as the seventeenth century. The adequate analysis, discussion, and consideration of them involved the exercise of the most painstaking industry and the highest legal and judicial ability.

Although the proceeding was officially designated an arbitration, it was really a stupendous lawsuit between nations, and its determination was controlled by the recognized rules of international and municipal law as applied to the facts found by the arbitrators, regardless of all considerations of diplomatic expediency. In the decision which the Court handed down, two points maintained by Great Britain were upheld, and five of those claimed by the United States. The seven questions arising out of the application of the Anglo-American Treaty of 1818 were:

First: Must any reasonable regulations made by Great Britain, Canada and Newfoundland in the form of municipal laws, ordinances, or rules (such regulations being appropriate or necessary for the preservation of the fisheries, desirable on grounds of public order and morals, equitable and fair as between local fishermen and inhabitants of the United States), be subject to the consent of the United States?

Second: Have the inhabitants of the United States, while exercising the liberty to take fish on the treaty coasts, a right to employ as members of their fishing crews persons not inhabitants of the United States?

Third: Can the liberties to take, dry and cure fish in treaty-designated places be subjected, without the consent of the United States, to the requirements of entry or report at customs houses or the payment of dues, or any similar conditions?

Fourth: Can restrictions be imposed upon American fishermen, making the exercise of the privileges granted them by the treaty to enter certain bays or harbors for shelter, repairs, wood, and water conditional upon the payment of light or harbor or other dues on entering or reporting at customs houses, or any similar conditions?

Fifth: What is a bay within the treaty's meaning?

Sixth: Does the treaty give the inhabitants of the United States the same liberty to take fish in the bays, harbors and creeks in Newfoundland as in Labrador?

Seventh: Are the inhabitants of the United States whose vessels resort to the treaty coasts to exercise the liberties referred to in Article I of the treaty entitled to have for those vessels, when duly authorized by the United States in that behalf, the commercial privileges on the treaty coasts accorded by agreement or otherwise to United States trading vessels generally?

The first and fifth questions were decided contrary to the claims of the United States. The award in favor of Great Britain on the first question, involving a seeming cession of sovereignty, was generally considered by many competent observers as the most important of

all. The other point decided in favor of Great Britain concerns the "headland doctrine," wherein the British contended that the three marine miles within which the United States had agreed not to take fish should be measured from an imaginary line drawn across the mouth of the bay, no matter how wide, from headland to headland. On the other hand, America contended that the line should follow the coast's sinuosities. Dr. Drago dissented from the majority judgment on this point and upheld the American contention.

On the other points the United States won. Hereafter the British cannot make our fishermen report to customs houses; they cannot impose on these fishermen light, harbor, or other dues; we may employ Newfoundlanders on our fishing vessels, and these vessels have the right to purchase supplies and to enjoy other commercial privileges. Moreover, the award provides that disputed fishing regulations shall be submitted to an impartial commission, composed of one expert from each country and Dr. Paulus Hoek, the Fisheries Adviser to the Dutch Government, and recommends that a similar commission be made permanent.

ORINOCO CLAIMS CASE. What has been known as the "Orinoco Claims Case" was decided September 20, three months after the Fisheries Case. The facts are as follows: The Orinoco Steamship Company, a company operating under a New Jersey charter, brought an action for damages against the Venezuela government for the repudiation by President Castro of an agreement giving the company certain exclusive privileges in that country. Damages to the extent of \$1,400,000 were claimed. The case was submitted to Dr. Charles Barge as umpire, who on February 22, 1904, awarded the company \$28,700. The company appealed to the United States government, which rejected the award on the ground that it was in violation of the principles of international law. After prolonged negotiations, Venezuela was finally induced by the late William I. Buchanan, who was sent as a special envoy to Caracas, to allow the whole matter to go to The Hague Court. The American government, represented by William C. Dennis, Assistant Solicitor of the Department, held that the Barge award was in many ways erroneous and unjust, and ought therefore to be declared null and void. On four points the Barge award was declared null. The Steamship Company was awarded \$46,867, with three per cent. interest since June 6, 1903, and \$7000 costs, to be paid by Venezuela in two months. Although the award was small and some of the American points were not sustained, the American representatives considered the decision a vindication of the American government's position in the matter. This case is regarded as especially interesting from the fact that it practically establishes The Hague Tribunal as a court of appeal, even though appeal to it, as in this instance, was by agreement of the parties.

BRAZIL AND BOLIVIA. An arbitral award between Brazil and Bolivia was published early in 1910. Some five years ago blood was shed in the zone contested by the two countries and war was at one moment feared. The matter was submitted to arbitration by the Treaty of Petropolis, November 17, 1903. The labors of the tribunal appointed under the treaty were suspended from May 20, 1906, to February 6,

1907, but by a protocol of that date it was decided to recommence those labors, the Apostolic Nuncio to Brazil being appointed President of the Tribunal, assisted by a Peruvian and a Brazilian delegate. The award finally made was sympathetically received by both nations.

**SWITZERLAND AND ITALY.** A dispute arose several years ago between Switzerland and Italy with regard to the deduction of 6 per cent. customs duty on wines imported from Italy. The latter wished to derive a profit other than that established by usage. She began in 1893, on the occasion of the renewal of the treaty, by prolonging for a month, from November 30 to December 31, the date when wines could be imported on the old conditions. Finally, in the last treaty, she modified the text specifying the conditions on which the Italian wine growers maintained they were now exporting their wines to Switzerland. The Swiss Fiscal Department was opposed to this interpretation, whence resulted a dispute which was tried by an arbitration tribunal consisting of two members, one an Italian, one a Swiss, and an umpire.

**THE ALSOP AND EMERY CASES.** There are pending two American arbitrations of considerable interest: The *Alsop case* had its immediate origin in the contract between one John Wheelwright, representing Alsop and Company (an association of American citizens doing business under the laws of Chile) and the government of Bolivia, by which Bolivia became obligated to pay sums aggregating 835,000 bolivianos, with interest at five per cent., and 270,000 bolivianos with accrued interest. The United States has contended for a great many years that Chile had become obligated to pay the full amount of this sum, and while Chile has admitted some liability, it contended that the liability was limited. The two governments not being able to agree upon this question of the liability of Chile, under all the circumstances of the case they agreed in a protocol signed at Santiago on December 1, 1909, to submit the whole matter to King Edward VII, as *amiable compositeur* to determine the extent of Chile's liability in this case.

The Emery case arose from the "clauidication" of a concession to cut and export timbers from Nicaragua held by the Emery Company, an American corporation. The United States contended that the action of the Nicaraguan government was improper, and Nicaragua alleged its propriety. After several months of negotiations the Nicaraguan government agreed to submit the matter to international arbitration. For more than two years the two governments endeavored to reach an agreement as to the terms of submission. An agreement was finally reached, and a protocol of arbitration was signed at Washington in which Nicaragua reserved the right to settle the case with the claimants through the Department of State within a certain period of time named in the protocol. Before the expiration of this time a protocol of settlement was signed by the representatives of the two governments.

**RUSSIA AND TURKEY.** Another great triumph for international arbitration has been in the recent agreement of Russia and Turkey to submit to The Hague the issues between them growing out of the indemnities Turkey agreed to pay Russia at the close of their last war, thirty-three years ago. From every point of

view this agreement is of very great interest and importance. This case and the "Savakar" question between Great Britain and France, soon to be tried, constitute the ninth and tenth cases to be submitted to The Hague Court.

**SOUTH AMERICAN BOUNDARY DISPUTES.** The important boundary dispute between Bolivia and Peru, arbitrated in 1909 by the President of Argentina, resulted in bitter feeling between Bolivia and Argentina because of the former's dissatisfaction with the award. The matter has now been happily adjusted and diplomatic relations between these countries have been resumed. South America the past summer was also the scene of a great achievement in mediation—the settlement of the acute boundary dispute between Ecuador and Peru through the mediation of the Argentine Republic, Brazil and the United States.

**COURT OF ARBITRAL JUSTICE.** The recently organized American Society for the Judicial Settlement of International Disputes has for its underlying purpose the promotion of the project to establish a judicial tribunal which will do for the civilized world what the ordinary courts of justice do for the individual and to encourage recourse to it when established. Such a tribunal is foreshadowed in the Court of Arbitral Justice adopted in principle by the Second Hague Conference. It differs materially from the existing Court of Arbitration at The Hague. The latter consists practically of a panel of judges to be drawn upon when it is desired to organize a tribunal of arbitration for some specific case. Courts of arbitration, so organized, in the opinion of the new society, have certain inherent weaknesses; their members are often nationals of the contesting countries with all the prejudices appertaining thereto; it is more or less difficult to fix upon arbitrators acceptable to both sides; an arbitration is costly and the expense is borne solely by the nations parties to the dispute; the court is dissolved after settling the case before it, and such a tribunal must lack continuity. A permanent court of justice, on the other hand, would gradually establish precedents by which it would be governed and would help to build up international law precisely as municipal law is built up to-day by the decisions of the ordinary courts of justice. It would gradually acquire a wide knowledge of international practice, and in time win the respect and confidence of the world just as the Supreme Court of the United States has won the confidence of the people of the separate States of the Union. Furthermore, its very existence would be an invitation to define more clearly international law and possibly to codify portions of it. An example in point is the fact that the establishment of an International Prize Court by the Second Hague Conference (1907) led to the holding of a convention in London (1908-9) to codify the law of prize. The expense of maintaining the Court of Arbitral Justice will be borne by the nations jointly. At a conference of this society, which took place in Washington, Dr. Charles W. Eliot, arguing in behalf of the judicial settlement of international disputes by a permanent court, emphasized the objections to international arbitration, saying, in the first place that the tribunal was special and temporary and secondly that its nature was not satisfactory. He said that to trust a single umpire was obviously risky and that arbitration practically

amounted to this, for it was customary for each of the disputing nations to name an arbitrator, the two thus named selecting a third, who therefore was virtually an umpire. The compromises attained were seldom satisfactory to either disputant. These remarks called forth some criticism, as they were held to imply that arbitration had been a failure. In reply it was said that it had, on the contrary, been a conspicuous and continuous success, more than 250 important controversies having been disposed of by means of it. At the meeting of the Lake Mohonk Conference it was announced that the Secretary of State had received in response to a circular note addressed to the nations, such favorable answers that he believed "a truly permanent court of arbitral justice composed of judges acting under a sense of judicial responsibility, representing the various judicial systems of the world, capable of insuring the continuity of arbitral jurisprudence, will be established in the immediate future, and that the third Peace Conference will find it in successful operation at The Hague." This proposal of Secretary Knox for a permanent international court made steady progress toward general acceptance during the year, Italy being the last to take affirmative action (December 16, 1910).

**THE CENTRAL AMERICAN COURT OF JUSTICE.** Organized in 1908, the Central American Court of Justice has had two cases submitted to it. In the first case, it sat in *judgment upon nations*, the first event of the kind in the history of the world. Honduras was plaintiff, accusing Salvador and Guatemala of protecting and fomenting a revolution against the government. According to the provisions of the convention establishing the Court, it was able, three days after the complaint was filed, to issue an interlocutory decree fixing the *status quo* and restraining the revolutionary movement pending decision of the case. Five months after the case was begun, judgment was rendered, the complaint being dismissed for want of sufficient evidence to support the allegations of Honduras. The second case was instituted in 1909 by an individual, Dr. Pedro A. F. Diaz, a citizen of Nicaragua, against the government of Guatemala, claiming damages for alleged arbitrary imprisonment by the Guatemala authorities, business losses and permanent injuries to health. The Court dismissed the case on the ground chiefly that Diaz should first have resorted to the local courts of Guatemala, and failing to obtain justice there, should have called upon his own government to support his claim. These cases have demonstrated, in the view of the Business Men's Committee of the Lake Mohonk Conference, first, the practicability of this calm, deliberate and orderly method of settling international difficulties, for the revolutionary movement quickly subsided, being held in check by the interlocutory decree until the Court rendered its final decision, which was acquiesced in and obeyed by all parties concerned; and secondly, that an international court can be so constituted that individuals as well as nations may resort to it.

**CARNEGIE PEACE FUND.** On December 14, 1910, Andrew Carnegie transferred to twenty-seven trustees a fund of \$10,000,000, to be devoted primarily to the establishment of universal peace by the abolition of war between nations and such friction as may impair the progress and happiness of man. The trustees

named are: Elihu Root, United States Senator, New York; Nicholas Murray Butler, President Columbia University, New York; Dr. Henry S. Pritchett, President of the Carnegie Foundation for the Advancement of Teaching; Joseph H. Choate, lawyer, ex-Ambassador to Great Britain; Albert K. Smiley, Lake Mohonk, educator and humanitarian; Dr. Charles W. Eliot, President Emeritus of Harvard University; James Brown Scott, Solicitor of the State Department; John W. Foster, lawyer, of Washington, D. C., ex-Secretary of State; Andrew J. Montague, lawyer, ex-Governor of Virginia; William M. Howard, lawyer, Congressman, Lexington, Georgia; Judge Thomas Burke, Seattle, Washington; James L. Slayden, Congressman, San Antonio, Texas; Andrew D. White, ex-Ambassador to Germany; Robert S. Brookings, lawyer, St. Louis; Samuel Mather, banker, steel manufacturer, Cleveland; J. G. Schmidlapp, railroad man, Cincinnati; Arthur William Foster, Regent University of California, San Francisco; R. A. Franks, banker, Hoboken, N. J.; Charlemagne Tower, ex-Ambassador to Germany and Russia; Oscar Straus, Ambassador to Turkey; Austen G. Fox, lawyer, New York; John L. Cadwalader, lawyer, New York; John Sharp Williams, Senator-elect from Mississippi; C. L. Taylor, of Pittsburg, chairman of the Carnegie Hero Fund Commission; George W. Perkins, of New York, financier and philanthropist; Robert S. Woodward, Washington, D. C., president Carnegie Institution, of Washington, and Cleveland H. Dodge, New York, secretary Carnegie Institution.

These twenty-seven representative men, in accepting the trust, on motion of Joseph H. Choate "Resolved, That the trust fund for the promotion of peace specified in the instruments subscribed to and delivered this day by Andrew Carnegie be, and is, hereby accepted for the purposes prescribed by the donor; *Resolved*, That in undertaking to hold and use, in trust, this munificent gift for the benefit of mankind, the trustees are moved by a deep sense of the sincere and noble spirit of humanity which inspires the donor of the fund. They feel that all thoughtful men and women should be grateful to him and should be glad to aid, so far as lies within their power, towards the accomplishment of the much-to-be-desired end upon which he has fixed his hope and to which he wishes to contribute. They are not unmindful of the delicacy and difficulty involved in dealing with so great a sum for such a purpose, wisely and not mischievously, and in ways which shall be practical and effective. They accept the trust in belief that, although doubtless many mistakes may be made, great and permanent good can be accomplished."

**LAKE MOHONK CONFERENCE.** The Sixteenth Annual Mohonk Conference on International Arbitration was largely attended. Its sessions were marked by the declaration of Secretary Knox already referred to and by the presence of the Dean of Worcester. In its declaration, the Conference reaffirmed its declaration of the previous year respecting the portentous growth of the military and naval establishments of the great powers, and called renewed attention to the fact that the rapid development of the instrumentalities of law and justice for the settlement of international differences furnishes to the statesmanship of the civilized world the long-desired opportunity of limiting by agreement

the further increase of armaments. The coming celebration of the one hundredth anniversary of the arrangement between Great Britain and the United States definitely limiting the naval force on the Great Lakes and the St. Lawrence to four hundred tons and four eighteen-pounders, calls renewed attention to the continued menace to the peace of the world caused by the prevailing conditions and emphasizes the fact, so well expressed by former President Roosevelt in his Christiania address, that with "sincerity of purpose the great powers of the world should find no insurmountable difficulty in reaching an agreement which would put an end to the present costly and growing extravagance of expenditure on naval armaments."

**CONGRESS OF CHAMBERS OF COMMERCE.** The Fourth International Congress of Chambers of Commerce and Industrial Associations was held in London, June 21st to 23rd, 1910. These congresses, held every two years, bring together the business forces of the world. They assure the concerted action necessary for the further advance of the peaceful intercourse of nations. The First International Congress of Chambers of Commerce and Industrial Associations was held at Liège, Belgium, in 1905. The three days' session was devoted to commercial associations, their organism and the ways and means of securing effective international action. It resulted in the creation of a permanent Committee of Congresses of Chambers of Commerce and Industrial Associations, and the decision to hold congresses every two years. The Second Congress was held at Milan, Italy, in 1906, and the Third Congress at Prague, Austria, in 1908. At these congresses the organization was perfected, by laws were adopted, the Permanent Committee was elected and special committees were appointed. Following is a translation of some of the resolutions adopted at the London convention: Establishment of a Fixed Date for Easter; Unification and Simplification of the Gregorian Calendar.

"It is desirable to establish a fixed international calendar."

"It is desirable to establish, by international agreement, a fixed date for Easter."

"The Congress instructs the Permanent Committee to invite one of the governments to convoke a diplomatic official conference with the object of establishing a fixed date for Easter and a fixed international calendar."

Development of Postal Unions and of the European Postal Union.

Enforcement of judgments and arbitration awards pronounced in foreign countries.

a. Judgments: "The Congress is of opinion that the enforcement of judgments in foreign countries, without revision, would be facilitated by agreements between countries which have reciprocal confidence in their judicial institutions, and whose legislation rests upon similar bases."

"In consequence of the diversity of legislation, agreements between two or several countries would be more easily attained than a universal convention, or one concluded between a large number of states."

b. Arbitration Awards: "The Congress desires the Permanent Committee to institute an inquiry into the conditions under which the arbitration awards are made in different countries, and would be grateful if His Britannic Majesty's Government would take the initiative as to such inquiry."

The next Congress will be held in Boston in 1912.

**INTERPARLIAMENTARY CONFERENCE.** The Sixteenth Interparliamentary Conference held at Brussels in the Palais de la Nation, the last of August, was an unusually interesting meeting of this great organization of three thousand statesmen. The parliaments of nineteen countries were represented. There were in all seven hundred and sixty-eight members present, more than filling the Senate Chamber, including the galleries. The Conference was opened by Auguste Beernaert, the veteran Belgian statesman, former president of the Chamber of Deputies, recipient of the Nobel prize, and subsequently presided over by Mr. de Sadeleer, ex-president of the Chamber of Deputies. In his opening speech, Mr. Beernaert said that the position of the Union had been materially strengthened since various nations had contributed towards its financial support. Though the results of its work had not yet been adequate, there was, he thought, ground for real encouragement, as arbitration and mediation formed to-day an integral part of international relations, rapprochements were being established between peoples, and the universal conscience was finding its mouthpiece in The Hague Conference, in its demand for reduction of armaments and the general application of arbitration to the settlement of disputes.

**PUBLICATIONS.** During the year 1910 the American Association for International Conciliation has published the following series of leaflets, to which a large circulation has been given: *The East and the West*, by Seth Low, (1910); *The Moral Equivalent of War*, by William James, (1910); *International Unity*, by Philander C. Knox, (1910); *The United States and Australia*, by Percival R. Cole, (1910); *The United States and Germany*, by Karl von Lewinski, (1910); *The United States and Mexico*, by James Douglas, (1910); *The International Duty of the United States and Great Britain*, by Edward D. Mead, (1910); *Opening Address at the Lake Mohonk Conference on International Arbitration*, by Nicholas Murray Butler, (1910); *An Economic View of War and Arbitration*, by John B. Clark, LL. D. (1910); *Peace Versus War: The President's Solution*, by Andrew Carnegie, (1910); *Conciliation through Commerce and Industry in South America*, by Charles M. Pepper, (1910); *International Conciliation in the Far East: A Collection of Papers upon Various Topics*, by Rt. Rev. L. H. Roots, Rev. Dr. J. H. DeForest, Prof. E. D. Burton, Rev. Dr. Gilbert Reed and Hon. John W. Foster, (1910); *The Capture and Destruction of Commerce at Sea, and Taxation and Armaments*, by F. W. Hirst, (1910); *Selections from Speeches Delivered in Congress on the Naval Appropriation Bills of 1906, 1908, 1909 and 1910*, by Hon. Theodore E. Burton, (1910).

In addition to carrying on a general propaganda the International School of Peace has been publishing a series of useful pamphlets and reprinting standard works. Among them are the following: Bloch's *The Future of War*, Sumner's *Addresses on War*, Channing's *Discourses on War*, Warner's *The Ethics of Force*, Bridgman's *World Organization*, Dodge's *War Inconsistent with the Religion of Jesus Christ*, Hull's *The Two Hague Conferences*, Scott's *The Texts of the Peace Conferences at The Hague*.

**ARCHÆOLOGICAL INSTITUTE OF AMERICA.** A learned society founded in Boston in 1879 and incorporated by Act of Congress in 1906. The purpose of the Institute is to promote archæological research by founding schools and maintaining fellowships, by conducting explorations and excavations and by aiding in those conducted by others, by publishing the results of archæological research, by holding meetings for the presentation and discussion of archæological subjects and by maintaining courses of the University of Michigan, was re-elected its activities in the various fields of archæological interest, especially Greek, Roman, Oriental and Renaissance. It has also conducted researches in the United States, Mexico and Central America. It publishes the *American Journal of Archæology*, which contains original contributions, reports and summaries of archæological work in all parts of the world, and a bibliography of archæological books. Of this journal, four numbers are published annually, together with a supplement which contains the annual reports of the institutes and of the schools. The schools maintained by the Institute are the American School of Classical Studies at Athens, established in 1881; American School of Classical Studies in Rome, organized in 1895; American School for Oriental Study and Research, founded in 1900; and the School for American Archæology, founded in 1907. The Carnegie Institution of Washington supports a fellowship in archæology in the American School of Classical Studies in Athens, and grants \$1500 annually for excavations. The Institution also maintains two fellowships for research in the American School for Classical Studies in Rome, and grants \$1000 annually for publication. The Institute holds annual meetings. The meeting in 1910 was held in Providence in conjunction with the meeting of the American Philological Association. The work of the society during the year was reviewed in a number of interesting papers. Work was done in excavation in Samaria, Sardis, Crete, Cyrene, Guatemala, and Southwestern United States. A paper was read by Frank J. Mather, Jr., of Princeton University, on Italian Paintings in America. Dr. Esther B. van Deman presented an original study of the technical characteristics of Roman brick work. Another paper of unusual interest was read by William H. Goodyear of the Brooklyn Institute of Arts and Sciences, dealing with recent studies of the Leaning Tower of Pisa. The needs of the Institute for an endowment were emphasized at this meeting. The American School in Palestine is greatly in need of a building for a working library and an annual income of at least \$16,000. Other schools are also in need of endowment funds. Professor Francis W. Kelsey, of the University of Michigan, was re-elected President, and Professor Mitchell Carroll of Washington, D. C., was elected General Secretary. William Sloane, of New York City, was re-elected Treasurer. On invitation of the American Institute of Architects the Institute will take up national headquarters in the historic "Octagon" in Washington. See ARCHÆOLOGY.

**ARCHÆOLOGY.** The year 1910 was marked by two notable undertakings by Americans in the field of archæology: at Cyrene (see below) the expedition sent out by the Boston

Museum of Fine Arts has made a preliminary survey with the view to excavating on that site, while Professor Howard Crosby Butler of Princeton University has actually made considerable headway in the excavation of the site of ancient Sardis. These excavations will be considered later in this report. On most of the important sites the work of past years has been continued and some work brought to a close.

**MESOPOTAMIA.** At Assur, the ancient capital of the Assyrian Empire, the Germans have conducted excavations on the northeast corner of the mound of the great temple of the god Assur. This temple was built by one of the earliest kings of the country, Uspia. Near by the palace of Shalmaneser I. has been discovered, and the temple of Anu and Abad has been shown to have been built by Assur-resi-isi, the father of Tiglath-Pileser I., about the year 1150 B. C. The temple was afterward rebuilt by Shalmaneser II. about the year 850 B. C. Not only has the building inscription of Assur-resi-isi been recovered, but the Germans have found as well that of Tiglath-Pileser, who boasts in his annals of having restored the building.

**SYRIA AND PALESTINE.** Scholars of the same nationality, that is, the Germans, have also been at work at Jericho where the great city wall has been unearthed. The workmanship of this wall displays an exceptional degree of engineering skill in the matter of laying the large stones in place. In addition to this the remains of a fine building, which seems to have been a citadel, were uncovered. In strata of late Jewish times—dating in the Hellenistic period—the excavators discovered jar handles that bore the divine name Yah or Yahu written in Aramaic script. In the Canaanite strata were encountered numerous infant jar-burials. The date of these is afforded by the fact that in company with them was found pottery of the Mycænan and Cypriote periods. From the archæological evidence afforded by the excavations, the deduction is drawn that the account of Jericho as given in the Old Testament is far from correct. The Canaanitish walls were not found to have been overthrown to any extent, nor were there any signs of any great conflagration. It will be recalled that Joshua (vi. 24) narrates that the vessels of iron were preserved by the Israelites, whereas it is now known that the Canaanites did not make use of iron. This is shown by the fact that no iron was found in the Canaanitish levels at Jericho. In addition to this there is no evidence to confirm the statement that Jericho was not rebuilt until the time of Ahab. On the contrary the archæological evidence proves that there was a continuous occupation of the city from the earliest times.

Of great importance are the results of the Harvard University excavations which were begun in 1908. This year the excavators continued their work on all the sites touched upon in the previous year, especial emphasis being laid on the palace which is located on the summit of the hill. Although this building has not yet been completely uncovered, it can be seen to have covered more than one and one-half acres. In it four building periods have been made out, which have been assigned tentatively to the times of Omri, Ahab, Jehu, and Jeroboam II. The assignment of the original building to Omri and Ahab seems to be confirmed by the discovery of an alabaster vase

bearing the name of a contemporary of the latter king, namely, Osorkon II. of Egypt. Of exceptional interest, however, was the discovery this summer of some seventy-five potsherds inscribed with records written in the ancient Hebrew language. That these records were originally placed upon these fragments is shown by the fact that in certain cases the writing is crowded to fit the space at the disposal of the scribe, and also by the fact that several fragments bearing different inscriptions came from the same vase. The script is the Phœnician, which was widely current in antiquity, and is very different from the square characters, so called, in which the existing Hebrew manuscripts of the Bible are written. That it is practically identical with the script used in the Siloam Tunnel settles the question whether that inscription can be as early as the time of Hezekiah. Since also it is the same as that employed on the Moabite stone there is reason for placing these ostraca in the eighth or ninth century B. C. Confirmation of this is afforded by the place of discovery which would lead to assigning them to the time of Ahab. The inscriptions on the potsherds are written in ink with a pen. Except in two instances the fragments seem to be dated, the date given being the ninth and tenth years. Since they referred to wine or oil, there was no need to give any month or day; the vintage sufficed. It is of interest to note that the names of gods appear only as elements in the formation of those of men. The recurrence of the name Baal in the formation of such names is to be explained by the fact that in the Book of Kings we find it recorded that in the reign of Ahab there was a great revival of the worship of Baal in Israel. This was probably due to the fact that Ahab's queen was from Tyre, where this cult was specially in vogue. The name of Israel's god is about as frequent as that of Baal. It occurs in the form Y H W and Y H. These inscriptions are the earliest instances of Hebrew writing known, and are more numerous by far than all the other known Hebrew inscriptions. Their importance therefore can easily be appreciated.

**EGYPT.** Much important archaeological work was done in this country during 1910. At Abydos, Naville and Hall have cleared the tombs of Den and Perabsen, and among other things recovered during the excavations were mud sealings of Perabsen and Sekhemb. In addition to this these scholars found many bone pins, a crystal vase which seems to prove that Dan is not Usaphais, and, incised upon pottery, the "hawk name" of a king which may prove to be that of a ruler of the first dynasty, which has not yet been recorded. To the north of the royal tombs were discovered many objects which belong in the time reaching from the sixth to the eighth dynasties. In this locality also came to light a cemetery of common people which belongs in early times. At Assasif the tomb of Menkheper-ra-senb, who was a high priest of the time of Thothmes III., was discovered. At Karnak the restoration of the Hypostyle Hall has been completed. From the territory between this hall and the Sacred Lake has been recovered a colossal statue of Useresen I. The statue is in fine condition.

The expedition of the Metropolitan Museum of Art continued to work at the temple of Hibis in the oasis of Kharga. The task undertaken was that of clearing out the tem-

ple, and the work was carried on in conjunction with the Egyptian government. The excavation began in December, 1909, and was first concerned with clearing out the portico of Nectanebo. After this the digging continued through the great eastern doorway. Here the Hypostyle Hall was found to be in a state of great confusion because of the blocks which had fallen down, so much so that the interior of the hall was filled to the height of several metres. During the work some interesting reliefs were discovered, among which was one showing Darius, who built the temple, in a boat picking papyrus flowers to offer to the god Min. Another relief shows the god Sutekh, a popular deity of the oasis, slaying the serpent of evil. Among other objects discovered were an isolated capital with the coloring preserved, and a fragment of a bowl which was dedicated in the reign of Apries—that is, about 588-589 B. C. This bowl appears to have been used in the temple and therefore argues for a temple at this place as early as the Saite times. At present there exist two stages of the temple earlier than the reign of Nectanebo, as well as evidence for many additions and changes, before unknown, dating from Ptolemaic times.

The English continued their work at Memphis. In part this has been experimental with the view to finding how much of the site ought to be cleared exhaustively. It was shown that about twelve feet of soil would have to be removed before coming to early dynastic remains. It was moreover demonstrated that the destruction of the ancient town of Memphis by the builders of Cairo was much more extensive than had been previously supposed. The chief results obtained this year from the temple consist in the remains of a large shrine of quartz built by Amenhotep III. From this were obtained two blocks with fine figures of the king and a goddess. From a shrine of Amasis was secured a perfect portrait head of the king, which appeared in a scene on this shrine. At the palace site, which was cleared last year, it was found that the foundations were of enormous depth and that the great court of Apries, which rises about forty-five feet in height, extends in its foundations to a similar depth below the surface of the pavement. From the palace came a curious lot of sweepings from a Persian office, with Aramaic labels which came off parcels from Syria and some dozens of sealings among them. These seals are for the most part Persian and Egyptian—one showing an alliance between a king of the Black Sea and the Hittites. A perfect Persian steel sword and a massive bronze corner of a cedar door were found.

At Meydum an important tomb was discovered. Excavation disclosed a passage thirteen metres long from which opened out a cross-shaped hall nine by six metres in ground-plan. In this hall was found a red granite sarcophagus which has proved to be the oldest granite sarcophagus known. The blocks which cover the hall as a roof are of huge size, being five and one-half metres long by two and one-half broad, by one thick, and computed to weigh about forty tons. The burial chamber is five metres high. Unfortunately the sarcophagus had already been plundered when it was discovered. The date of its manufacture is about one-half century before the date of the Great Pyramid. The chamber in which it reposed, already referred to is finer than that of any known

private tomb, and even exceeds those of many of the pyramids. The plundering of the tomb has evidently been done by some one who knew how to break into the place—probably one of the workmen employed in building the tomb. Another interesting discovery was made when the east face of the pyramid at Meydum was being cleared. Here blocks of stone were found with the month of the quarrying carved upon them. Since the season of working is fixed by the inundation of the Nile, it was a simple matter to arrange the shifting months of the Egyptian calendar by seasons. As a result the dating of the third to the twelfth dynasties as given by Manetho was found to be correct. So if we rely upon this authority as much after the twelfth dynasty as before, King Sneferu is to be dated 4700 B. C. If, however, he is arbitrarily rejected as an authority then this king is dated 3200 B. C.

At Quft (ancient Coptos) were discovered a quantity of stelai giving the names of kings of the eighth dynasty, hitherto supposed to have held merely nominal sovereignty to the south of the delta of the Nile. In the Valley of the Tombs of the Kings, Davis and Jones have opened several tombs, but they were for the most part empty.

ASIA MINOR. At Didyma the German excavations, which were begun in 1905, have now freed a large part of the old sanctuary of Apollo. The importance of the excavations here is shown by the numbers of inscriptions, accounts, etc., which throw light upon even the smallest details relating to the construction of the temple. At Pergamon the Germans have discovered a great sanctuary and temple of Demeter. From inscriptions it has been learned that the temple was erected about the year 262 B. C., in honor of Boia the mother of the Attalid dynasty, and that in Roman times a vestibule was added to the structure. Within the sanctuary were found altars belonging to Hermes, Asklepios, Helios, Zeus, and other gods. Besides this there came to light fragments of a statue dedicated to Demeter, a relief representing the goddess standing near an altar with a torch in her left hand, part of a statue of Asklepios, heads of Hermes, and Eros, and four portrait busts of Roman date.

Excavations on the much-coveted site of Sardis were begun in March by Professor Butler of Princeton University. The work has been the uncovering of the old city which lies between the Acropolis and the river Pactolus. This city on the western slope has been buried by erosion or landslide so that at the edge of the river the deposit is six metres deep. From this point up to the standing columns of the temple, the depth increases until at the latter point the depth is ten metres. Further up toward the Acropolis the deposit is even thicker. Fortunately, this long gradual slope has been sharply cut off at the edge of the river, so that a fine cross-section, or stratigraphical chart, has been afforded. The excavations began at hardpan in this face with a cut about thirty metres wide with the intention of making straight for the standing columns of the temple. Before long a pavement was encountered and other remains of the stratum of culture about a metre and a half above the original level. About twenty metres further on toward the temple a building much in the form of an elevated stoa came to light. The structure is believed to be of very ancient date. The whole structure was built of unevenly cut blocks of sandstone covered with a very fine hard coat of stucco very similar to that found on Mycenaean

sites. A fragment of a blue Persian tile, like the tiles from Susa, was found lying on the pavement of the building. To the north and south of this building were found bases that belonged to statues and stelai now disappeared. Further on, as the excavations proceeded toward the standing columns, the workmen came upon a solid pier of large blocks of white marble and then others of the same nature. These structures, about three metres square, proved to be the foundation piers of the columns belonging to the western porch of the temple. As the digging proceeded into the deeper soil, the building was found to be better preserved. Toward the end of the season's campaign a portion of the north wall of the opisthodomos was uncovered and found to be standing to the height of over two metres. This wall is of unusual thickness and bears on its inner surface a long Greek inscription which may be assigned to the third or fourth century B. C. From it we learn that the temple was dedicated to Artemis and not Cybele, and we have in it as well a *terminus ad quem* for the date of the building. By the end of the season seven piers had been uncovered on the southern flank of the temple, as well as much territory about the western end of the temple. The building proved to be a pseudo-dipteral octostyle structure. Traces of lime-kilns not far below the surface explain the bad condition of the temple at the end toward the river; apparently during Roman and Byzantine times this part of the structure had been used as a quarry. During the rainy weather in May a number of the tombs on the mountain side across the river were excavated. The steep face of the mountain is honey-combed with these tombs which were concealed from view by the soil that the wind and rain have carried over them. Those opened proved to belong to an ancient Lydian necropolis. Each tomb was approached by a *dromos* and closed by a door made of one large stone or a number of small ones. One of these bore three complete inscriptions in the Lydian script. The burial chamber, cut in the hard clay of the mountain, has a pointed, double-pitched roof, and double couches which were also cut out of the clay, located one on either side of the chamber and a third opposite the entrance. In one tomb, in place of this third couch, a staircase led down to another passage which ended in a second chamber similar to the upper one. Most of the tombs had been rifled at a very early date. In most of them were found non-Hellenic pottery of good quality, in some of the tombs bronze objects, and in one a ring with an Egyptian scarab. Alabastra of Egyptian form were found in several tombs, and in one which had not been previously opened three beautiful gold necklaces. These burials belonged to a period considerably earlier than that of anything unearthed in the excavations across the river.

GREECE. The Greek Archæological Society has carried on many minor excavations and has busied itself as well with restoring buildings. The Propylaea has come in for especial attention. The restoration of this building has been made possible by careful studies that have been made by members of the American school. Hill has demonstrated that the old Parthenon (which was in process of construction at the time of the Persian wars) had sixteen columns on the side and six on the end, instead of nineteen and eight as Dorpfeld believed. At Chæroneia the Greeks have been carrying on excavations. At Colonus,

**STEPS AND INNER ROW OF COLUMN BASES FROM THE WEST**

**PART OF WALL OF ACROPOLIS**

**EXCAVATIONS AT SARDIS**

৩৩৩

Svoronos, while investigating the topography of the hill of Colonus Hippias, has discovered the "chasm" in the sanctuary Erinyes, in which the scene of *Œdipus Coloneus* is laid. The "chasm," which is 15 metres in depth, was situated below the foundations of a small, modern house located on the ancient road which led from Thebes. After the chief landmark of Colonus had thus been identified the other precincts mentioned by ancient writers were easily discovered. It also proved possible to establish the site of the Academy. At Corinth the American School has devoted most of its time to the excavations at Peirene and the theatre. In the latter place more Greek seats have been found *in situ* buried in the foundation of the *diazoma* of the Roman structure. At the fountain of Peirene two of the four reservoirs belonging to the earliest fountain have been cleaned out as well as a large part of the supply tunnels. The basin is located inside a building which is covered by a corbelled vault constructed of heavy blocks, which recalled to the excavators the system of vaulting in the galleries of the Mycenaean fortress wall of Tiryns. It appears that the fountain-house of Peirene is actually of prehistoric date, for neolithic and geometric potsherds were found there in great quantities. The spring which supplies the fountain is a natural one. To the north of Peirene colonnades have been discovered which complete the boundaries of the rectangular court and have been identified with the Peribolos mentioned by the periegete Pausanias as containing the picture of "Odysseus slaying the suitors." Perhaps the most interesting of the new discoveries in Crete is the finding of the late Minoan I cemetery at Gournia by Seager. The type is one previously unknown. It lies near the sea below the town of Gournia on the side of the hill by the name of Sphoungaras. The earliest graves discovered belonged to the usual Middle Minoan II type and contained the regulation pottery, vases of stone, and gold ornaments similar to those previously found at Moklos (recorded in the YEAR BOOK for 1908). Most of the burials—about one hundred fifty in number—were of such a character as to make the cemetery interesting. The bodies were found to be buried in inverted jars with the knees drawn up to the chin. In order to accomplish this the corpse had first been bound in a cramped position and then inserted into the jar head foremost. In no case was there evidence of burning. The date of the necropolis, that is, the Late Minoan I and Middle Minoan III periods was afforded by the character of the decorations painted upon the vases and by the objects found with them. The cemetery is somewhat earlier than the chamber tombs at Knossos. At Vrokastron, a hill about a thousand feet above the sea near Gournia, the Americans also unearthed part of a town the remains of which range from Early Minoan to the Geometric periods. In the level of the latter period iron was found in the same abundance as bronze. At Tylissos, a place about four hours west of Knossos, the excavation on the site of a Minoan building, begun in 1909, has been continued. In the rectangular structure near by, measuring 25.70 m. by 65.70 m., two steatite tables of offerings were found together with horns of oxen, deer, and wild goats, as well as many bones and teeth of pigs. At Hagia Triada near Phaistos, the Italians have made new excavations of an extensive character. The most important result of this work has been the dis-

covery of a great portico with eight rectangular piers of which the bases, built of limestone, are still preserved. At either end of this portico was located a staircase which led to an upper story. Of all the places in Crete, Knossos still continues to be of great interest. Under the southern porch of the palace there has been uncovered a huge rock-cut cistern, some ninety-five feet in circumference and fifty-six feet in depth, with a spiral staircase cut in the wall some nine feet from the bottom. Since nothing which makes it possible to descend to a point later in date than Middle Minoan I vase-fragments was recovered from the cistern, it is clear that the cistern is of Early Minoan date. It shows to what degree of culture the Cretans had attained at this time. Near the great Royal Tomb at Isopata more graves have been discovered. Here were obtained the most important results of the season's campaign. For six chamber tombs, belonging to the most flourishing period of the later palace were located. This dates them in the second half of the fifteenth century B. C. Although the tombs had previously been pillaged, the finds were of great importance. Late Minoan II style vases were obtained, and a small gold ring with two goddesses clasping hands and standing in front of their shrines. Besides this there turned up a new class of vases painted with unfixed colors and destined for funeral purposes. Perhaps the most important feature attaching to the tomb, called the "Tomb of the Double Axes" by Evans, is its religious character. In the burial chamber, about six m. square, the grave is sunk in a raised platform while all around the chamber run benches cut in the rock. The ritualistic double axes and the remains of a steatite rhyton suggest that originally the chamber was fitted out as a shrine for the cult of the dead. A comparison of the finds with those of the Germans at Tiryns shows that the Mycenaean culture is a parallel development with and not the mother of the Late Minoan culture.

At Delos the French have shown that the sanctuary of the foreign gods has two divisions—one for Syrian and one for Egyptian deities. The Egyptian temple and altar, dating at the end of the second century B. C., replaced sanctuaries of Serapis, Osiris and Anubis mentioned in inventories of the second Athenian league.

On June 17th, Dorpfeld made a discovery at Leukas which seems to back up his Ithaka theory, for he found a great area of seven circles of graves. In the largest of these circles (about nine m. in diameter) was located a fine burial of Homeric times, from which were obtained forty-nine gold beads, a silver arm-band, a quantity of obsidian knives and eight clay vases of every possible shape—among others a cask 1.10 m. tall in which the whole interment was placed. The cask was covered by a second.

In Northern Greece members of the British School examined two mounds, one at Tsangli, the other at Rachmani; the former was about two hundred by two hundred and ten m. in area with ten m. of deposit, the latter smaller in size. From these and previous results it is now possible to make four prehistoric periods for Thessaly. These are Neolithic I with red-on-white painted pottery, Neolithic II, Chalcolithic, and Early Bronze age, with unpainted pottery. The latter part of this is contemporary with Late Minoan II and III. At Sparta the British School put in a short season, which was

chiefly devoted to the excavation of Mycenaean remains on the hill of the Menelaion. A large number of late Mycenaean houses were found and from one of the best preserved were recovered some fine kraters and curious clay sealings used to close the mouths of wine jars; they had been tied in place with rushes and then stamped with a seal. Nothing of Greek date was found. The large Mycenaean town on this hill was probably destroyed by a fire at the beginning of the Iron Age. Sparta was refounded on the classical site.

At Thebes a Mycenaean cemetery has been discovered about the sanctuary of Apollo, and in the excavation of the temple countless Geometric clay objects were found. The work of the Germans at Tiryns shows that the excavations of Schliemann were incomplete. The most important finds made this year were remains of mural paintings, including parts of horses, a fragment of a cult scene, two warriors with lances, a charioteer, and particularly some fragments belonging to a boar hunt, in which white dogs are attacking boars caught in a net.

CYRENE. In June, 1910, the Archæological Institute of America obtained from the Turkish government a firman which allowed it to conduct excavations on the site of ancient Cyrene. About November 1st. the expedition under the leadership of Mr. Richard Norton reached the site of the proposed excavations, and in spite of all obstacles, such as the difficulty of obtaining efficient workmen and of transporting supplies from Malta—the nearest possible point—a good beginning was made during the months of November and December. The hill which rises above the fountain, believed by Norton to be the ancient Acropolis, was attacked with the result that various walls both of Greek and of Roman workmanship were uncovered and many small objects brought to light. Although as yet no finds of great value have been made, the excavators feel that there is every reason to look for discoveries of the greatest importance as the work progresses.

Cyrene was found by the expedition to be much as when left by Smith and Porcher, who made desultory excavations on this place. Their work, of course, has been somewhat overgrown. Of the inscriptions recorded by these men some have disappeared and some now remain in place. The extent of the town is at present one of its most striking features. According to Norton, a circle of a radius of five miles drawn from the Acropolis as a center would probably not include all the terraces, tombs, buildings and reservoirs in sight. These remains belong to all ages and until further work has been done it will be impossible to make any archæological division of the city. Except below the fountain the site is apparently not deeply buried.

ITALY. At Pompeii much attention has been devoted to the preservation of the houses discovered 1902-1905, and a certain amount of digging has been done in a pre-Roman necropolis. At Ostia much of the city has been examined, and a street leading to the theatre with a portico on its west side has been cleared. On the property of the King of Italy was found one of the three public baths mentioned by Pliny. In Rome the excavation of the Basilica Emilia has continued, and the Republican house near the Arch of Titus cleared. On the site of the Villa Spithoever a fine stretch of the wall which enclosed the city in the 5th century B. C. has been

lately excavated. It is of gray-green tufa and surely older than the so-called Servian wall.

GERMANY. At Alzei a late Roman fort dating from the fourth century A. D., of stone and in the form of a perfect square one hundred and sixty-five m. wide has been excavated. The walls are of a uniform thickness of three m. They were defended by numerous semi-circular towers, but lacked a ditch. Along the west wall were discovered barracks of which one was heated by a hypocaust.

FRANCE. The results of the excavations at La Turbie—above Monaco—have just been made known. This work was conducted at the Trophy of Augustus which was erected to commemorate the victory of that emperor over the people of the Alps. The structure is three stories high with a colonnade around the top one. The trophy which is 46.10 m. in height is the largest known, and is thought by Dieulafoy to have been based, as concerns its design, upon the Mausoleum at Halicarnassos. For an account of the Holm expedition in China see EXPLORATION.

ARCHÆOLOGY. AMERICAN. SEE ANTHROPOLOGY AND ETHNOLOGY.

ARCHER, WILLIAM. See LITERATURE, ENGLISH AND AMERICAN, section *Political and Social Science*.

ARCHER-HIND, RICHARD DACRE. An English classical scholar, died, April 1910. He was born in 1849 and was educated at Trinity College, Cambridge, where he graduated in 1872. From 1875 to 1903 he was a classical lecturer at this University. His publications include, the *Phædo* (1883) and *Timæus* (1888), of Plato and various classical papers. He was co-editor of the *Cambridge Compositions* (1900) and of *Translation into Greek* (1905).

ARCHITECTURE. The world's record of architectural achievement for the year 1910 appears to be of an average character, both in quantity and in quality, though with possibly less than the average number of important structures begun and a few of the first importance completed.

GENERAL CONDITIONS DURING THE YEAR. Substantial progress has been made on a number of buildings of the first rank begun in previous years, such as the Campanile of San Marco at Venice, the great monument to Victor Emmanuel at Rome, the Cathedral of Liverpool, the Cathedral of St. John the Divine in New York, the Public Library in the same city, and some others; while the volume of new work of secondary importance, both public and private, and of domestic architecture has apparently been fully up to the average of past years. The year closed with the entire civilized world at peace, except for the armed suppression of revolts and rebellions in Turkey and Mexico; and, in spite of the universal complaints of high prices and the increased cost of living, the year has been on the whole marked by general prosperity. Although it both began and ended in Great Britain with the excitement of a political campaign involving fundamental constitutional questions, there does not appear to have been any serious check to building activity throughout the kingdom.

PROMINENT FEATURES. Among the most noticeable features of the year's record were the completion and opening of the International Exhibition at Brussels, Belgium, the sudden destruction by fire of a considerable part of its buildings and exhibits and the energetic restora-

tion and reopening of a portion of the destroyed section; the completion of the brick work of the Venetian Campanile; and the completion and opening of the vast Pennsylvania railway terminal in New York. An important international exhibition in Buenos Ayres, and a new and interesting architectural activity in South Africa also deserve notice.

**CITY PLANNING AND IMPROVEMENT.** Of greater significance, however, than any of the material achievements of the past year, has been the remarkable and, indeed, unprecedented manifestation of interest in city planning and municipal improvement of all kinds. This movement has not been confined to any one country or even to one continent. At one and the same period, besides numerous local conferences and conventions on this general subject, there were planned for the fall of 1910 two great international congresses, one in New York, the other in London. The New York project was fortunately abandoned early in the year, and the field was left clear to the British organizers, thus avoiding what would otherwise have been a very embarrassing rivalry and conflict of interests. The London conference is noticed below; it attracted the widest possible attention and doubtless did more for the interests of municipal improvement than any and all previous efforts to arouse and educate public sentiment in this direction.

**UNITED KINGDOM.** In England no great architectural undertaking has been started during the past year. The most important works under continuous prosecution were the Cathedral of Liverpool and the London County Council Hall. The Lady Chapel of the Liverpool Cathedral has been dedicated—the first completed portion of the gigantic design of Gilbert Scott, destined to be the greatest or at least the largest of English Cathedrals. Severe criticism of the original plan has led to changes whose wisdom is questioned by many, particularly the substitution of a single massive central tower for the twin towers originally proposed. The choir will constitute a vast hall for preaching, but its enormous dimensions and its height of one hundred and forty feet to the ridge of the vault threaten the complete acoustic failure of this grandiose structure.

Meanwhile the University of Liverpool has completed a very handsome and extensive block of buildings for its engineering laboratories, in a style monumentally ornate though hardly suggestive of their particular purpose and function. Birmingham has placed itself on record as the first city to profit by the Housing and Town Planning act of 1909, in the laying out of the Harborne and Quinton District. This act is destined to have a far-reaching and beneficial influence upon the growing towns of Great Britain, especially in controlling the development of their suburban districts. At Manchester a new departure in English Y. M. C. A. architecture is seen in the new Young Men's Christian Association building by Messrs. Woodhouse, Corbett and Dean, a ten-story edifice of concrete construction throughout. The extreme character of the designs of a country house and of several shops by Edgar Wood, in the same city, approaching in eccentricity and originality some of the most outré examples of the *Art Nouveau* in Vienna and Bohemia, seems to indicate a greater readiness to forego all precedent and accept innovations than is generally to be looked

for in an English city. At Belfast (Ireland) an important competition was held for new buildings for the Medical School for Queen's University. The winning design, by W. H. Lynn, R. H. A. of Belfast, shows an interesting treatment of an irregular block enclosing a large quadrangle.

In Edinburgh the most important architectural event was a competition for a large hall for public concerts, to be known as Usher Hall. The successful design, by Stockdale Hanson and Sons and H. H. Thompson, is in process of erection. The award aroused some criticism, and the selected design was certainly less interesting in external architecture than some of the others; but was probably, all things considered, the best solution of the difficult problem of a concert hall to seat 3450 auditors. In the same city the new chapel to St. Giles's church was carried well on toward completion by its architect, R. S. Lorimer (not H. T. Oliver as reported in the *YEAR BOOK* for 1909).

In London the great County Hall has not yet begun to appear above ground, owing to the extensive preliminary works necessitated by its site to the southeast of Westminster Bridge. The embankment six hundred feet in length along the Thames has been completed in granite in the same general style as the Thames Embankment proper, under the direction of Mr. Fitzmaurice, O. M. G., and the foundations have been laid and the superstructure begun, of the County Hall, from the plans of Mr. Ralph Knott.

Next in importance to this, among works in progress during 1910, should be mentioned the extensive additions to the British Museum now being carried out from the designs and under the superintendence of Mr. Burnett of Glasgow. The old building, ill-planned behind its impressive Ionic colonnaded facade, is being completely remodeled and greatly enlarged, and when completed will form one of the finest architectural compositions in London.

An interesting and extensive architectural project has been undertaken by representatives of French interests in London, to be erected on Aldwych, the curved thoroughfare laid out a few years since to connect the Kingsway with the Strand. It will occupy an entire block, and is to contain a theatre for French drama, an exhibition hall, an elaborate French club-house, shops and many other features which will make it a notable artistic commercial and social center. The building, from the plans of Ernest Girard, will have a frontage of over six hundred feet, and will cost at least \$4,000,000. Unfortunately its exterior design is far from being worthy of the splendid architectural opportunity offered, or of the best traditions of French art.

More interesting architecturally as well as structurally, though of relatively small size and cost, is the church of St. Barnabas, Dalston, N. E., erected wholly of reinforced concrete from designs by Professor C. H. Reilly of the Liverpool School of Architecture. The entire structure, walls, floors, vaulted roof and dome, is of ferro-concrete construction, carried out with boldness and perfect artistic sincerity.

The completion from designs by Walton and Godfrey, and the inauguration of the new Crosby Hall in Chelsea, on the site of the historic sixteenth century house of the same name, was another item of interest in the year's record of the metropolis.

The creation of "garden towns," "garden

suburbs" and "garden villages" has taken on an extraordinary extension both in and out of London, and it would be impracticable even to catalogue the names of those begun, continued or finished in 1910. A few named at random are one at Hull, one in Hempstead, London, one at Ilford completed, and one at Kingston, one begun at Romford, and so on.

**INTERNATIONAL TOWN PLANNING CONFERENCE.** By far the most notable architectural event of the year in London was the International Town Planning Conference opened October 18th, under the auspices of the Council of the Royal Institute of British Architects, under the presidency of Leonard Stairs, with John Burns as Honorary President, Sir Aston Webb as Chairman of the Executive Committee, and J. W. Simpson as Secretary General. Delegates from all the principal nations took part in the Conference, those from the United States including among others Daniel H. Burnham of Chicago and Mr. Mulford Robinson. Germany, France, Belgium and Sweden were especially well represented among the European nations, and the papers and discussions were admirable in their scope, thoroughness, variety and breadth of view. The topics treated included not merely the architectural and other æsthetic aspects of city planning, but those relating to circulation, hygiene and the economic and governmental phases of the problems involved. It became clear that in the scientific study of these problems, as well as in the number and extent of the enterprises of city improvement undertaken or completed, the German Empire now leads the world. But Sweden, Belgium, Italy and France have made important and valuable contributions to the development of the science and art of town planning, and great Britain has made extraordinary strides in the same direction during the past few years. City Planning constitutes a distinct department of instruction in the School of Architecture of Liverpool University, and the Town Planning Act of 1909 is already bearing practical fruit in projects for municipal and suburban improvement throughout the United Kingdom.

The United States appeared to advantage so far as the widespread interest and activity in and for town improvement are concerned, and in the quality of some of the particular schemes presented at the Conference; but as a whole we are behind most of the European nations both in results thus far achieved and in the general recognition of the scientific principles that should underlie the whole movement. An important and most interesting feature of the Conference was the magnificent collection of plans and drawings exhibited in the Burlington House galleries.

**GERMANY.** The remarkable activity in German city-building and improvement, alluded to above, still continues. New railway terminals, bridges, town halls and municipal theatres have been projected, begun, carried on or completed, and there has been an unusual number of competitions for the remodeling of existing suburbs, or the laying out of new ones. Greater Berlin in various districts, Munich, Cologne, Düsseldorf, Nuremberg, Essen, and Ulm have all recorded during the year some enterprise of this sort, more or less important. An especial effort is being made to relieve congested districts and encourage the building of cottage-settlements for the laboring and wage-earning classes. As

examples of the general movement, Schöneberg in Greater Berlin has adopted a definite plan of improvement and development and has awarded the prize for a design for a new Rathaus (Town-hall) to Berger & Neidenorff, Cologne, beside plans for new suburbs, has adopted designs and begun the erection of a new bridge across the Rhine and of a new School of Industrial Art; the latter by Frantz Brantzky of Cologne is, like so many recent public buildings in Germany, positively ugly in exterior aspect, but well planned and scientifically arranged. In Stuttgart the first and second prizes were equally divided between Schlösser, Weirther & Bercher, and Lemp & Riethmüller, for an extensive block of buildings for the General Railroad Offices as the result of an important competition. Frankfurt announced an interesting competition for the architectural treatment of the inner end or head of the harbor. Darmstadt has begun the erection of an extensive municipal bathing establishment, a class of buildings in which the Germans are only rivaled by the English. Here again an interesting plan is housed in a dull and commonplace exterior. Among other undertakings of the year may be mentioned the new Kaiserbrücke (Emperor's Bridge) at Bremen, a Catholic church at Essen, a National Bismarck Monument at Bingen, and perhaps a score of "Bebauungsplänen" or plans for laying out streets, districts or whole suburbs, among which we can only mention as examples those for the new Bennigsen street in Hannover by Usadell of that city, and for the remodeling of the Kleberplatz in Strassburg.

**AUSTRIA.** In Vienna a beginning has been made of the remodeling of the square in front of the Church of San Carlo Borromeo. A new theatre, the Urania, has been erected in connection with a Urania club-house. A credit bank at Laibach from designs by Fr. Krasny; the rebuilding of the ground formerly occupied by the barracks at Lintz from designs by R. Traska; a picture-gallery by H. Ried of Vienna at Reichenberg and many buildings of more or less importance, public and private banks, clubs, schools, theatres, churches, townhalls, and mansions, in Bohemia, belong to the record of 1910 without deserving separate mention. Bohemia continues to be the field for the wildest eccentricities of the *Moderne Kunst* or *Art Nouveau*, which seems to rejoice in bare and ugly exterior, devoid of cornices, moldings and every feature which can impart charm or even interest to the design. Occasionally, however, the decorative sculpture by the very brutality of its modeling, succeeds in attracting attention and even admiration.

**FRANCE.** There seems to be less activity in France than in Germany, Austria and England, and even Paris offers a small showing for the year. The flood which so seriously damaged the city in January, when the Seine reached a higher level than at any time on record since the end of the seventeenth century, may account in part for this reduced activity. A new building or "Annexe" for the Department of Posts and Telegraphs, in the Cité Martignac, by Fr. Le Cœur, appears to be the most important of the new buildings of the year. Apartment-house building continues on the same lines as in other recent years, with much charming decorative detail, but with little improvement in the handling of the general composition. Not a little new work is being done in the old Latin Quarter, which is gradually losing its pictur-

esqueness. A new Students' Club is among the interesting structures in that district. The great campanile of the Sacré Cœur church on the heights of Montmartre has been carried up thirty or forty feet higher; it is to be completed by 1912.

Elsewhere in France there is little to chronicle, besides the usual grist of provincial theatres, small parish churches, hospitals and schools. A new château at Villers aux Erables by A. Guilbert is one of the most interesting of works of the second grade of importance in a refined and pleasing version of the Louis XVI. style, free from the aberrations of the New Art. Not strictly architectural, but architecturally interesting, is a railway bridge over a branch of the Rhone near Montargis, consisting of a single arch of masonry with a span of two hundred and sixty-two feet and an elevation of two hundred and four feet above the Varleérine River.

An interesting feature of the year's record is the proposal, somewhat widely discussed, to reduce the numbers of the vast army of official architects holding government appointments which are often sinecures but which confer official and social standing upon the incumbents.

**BELGIUM.** In Belgium the most notable buildings of the year were those for the International Exhibition at Brussels. The main palace, by Ernest Acker, in an unaffected Renaissance style wholly free from "modern" eccentricities, presented an elegant if not altogether imposing façade of eight hundred feet. Among the numerous special buildings the most interesting were that of the Dutch Government, more picturesque than almost any building in Holland, and the striking "New Art" building of the Herstal Arms Works, with its effective towers. The calamitous fire which in August destroyed the British section and large parts of the French and Belgian sections of the main palace, has already been referred to. It has aroused much discussion of the whole question of the construction and material to be used in exhibition buildings and in the stalls and display structures which they contain. A great new hotel, the Palace on the Place Rogier, by Leuer and Ponepe, was the most important permanent edifice of the year in the Belgian capital, which with Antwerp and some other cities was also engaged during the year in planning and executing comprehensive schemes of municipal improvement. Antwerp has planned, among other things, a new boulevard and ring of buildings on the site of the old fortifications.

**ITALY.** In Italy, the past year has witnessed in Rome the advance by a long stage towards completion of the Victor Emmanuel monument, including the setting up of the colossal equestrian statue of the King. The Palace of Justice has been completed, and much work done on the coming Exhibition of Fine Arts to celebrate the semi-centennial of Italian independence. The United States building for this exhibition, an interesting colonial design by Carrère and Hastings, with extensive gardens behind it, was begun and is attracting much admiring attention. At Turin work was begun on the buildings for the industrial exhibition of 1911. Milan reports continued work on the Sacred Heart Church and the laying out of an extensive garden suburb; Venice, the completion of the brick-work of the campanile of St. Mark, ready for the open belfry and its square spire.

**SWITZERLAND.** At Geneva a handsome new Museum of Art and History has been erected from designs by the architect of Camoletti.

**RUSSIA.** There has been a remarkable building activity in St Petersburg. The year's record is of seven hundred new buildings, mostly residences, costing sixteen millions of roubles. In the same city was held the first Russian Congress of Architects, which opened in December under the patronage of the Grand Duchess Maria Pavlovna.

**ARCHÆOLOGY OF ARCHITECTURE.** In the archæology of architecture in Europe, including the maintenance and restoration of ancient buildings, the most notable event has been the controversy over the state of the Leaning Tower or Campanile at Pisa. A government commission, as the result of recent measurements compared with those recorded in past times, reported a dangerous increase in the inclination of the tower, with the consequent necessity of costly and difficult engineering work to save it from destruction. Professor W. H. Goodyear, of the Brooklyn Institute, N. Y., however, pointed out in a series of minutely exhaustive articles, that the commission had made but a cursory examination both of the building and of the records, and by a most remarkable analysis both of their figures and of the records claimed to have proved that there has been not the slightest settling in seventy years. These articles have attracted world-wide attention, and the general conclusion seems to be that the American expert has proved his case. At Winchester (England), the underpinning of the defective foundations of the Cathedral has been carried out with great success under the architect, Mr. T. G. Jackson, R. A.; but the difficult problem of restoring the south transept front to verticality has not yet been attacked.

In France the restoration of the abbey of Fontevault has progressed under Mr. L. Magne, and has laid bare a number of tombs of the Plantagenets.

**UNITED STATES.** While the volume of building has not equaled that of 1909, in which the full tide was reached of reaction from the panic of 1907, it was nearly equal to that year's product. Thus in September, the building permits issued in fifty-eight cities were for buildings aggregating in cost \$49,000,000, as against nearly \$52,000,000 in September, 1909, a falling off of about six per cent. This is probably fairly representative of the year's record generally. In New York this record will fall little short of \$200,000,000.

**MUNICIPAL IMPROVEMENT.** The activity in municipal improvement continues unabated, especially in the Western and Central States. Thus Cleveland is rapidly progressing with the monumental layout of 1905, and is actually reaping a profit from it in the form of greater economy in the total ultimate cost of buildings and grounds as compared with the old-time scattered purchase of sites for public buildings. Denver has purchased land for the execution of an interesting civic-centre scheme, and Milwaukee, Minneapolis, Columbus, O., San Diego, and Los Angeles, Cal., in the West, Roanoke, Va., and Greenville, S. C., in the South, and Buffalo, Rochester, Philadelphia and Hartford, are all actively prosecuting their enterprises in the same direction. One-half mile of the new Philadelphia Parkway has been completed, and Buffalo has purchased land for a new central rail-

way station and civic square. At Los Angeles there was held a conference on city improvement. Washington, D. C., gave out to competition the designing of three important buildings to stand upon the stately Mall, respectively for the departments of State, Justice and Commerce and Labor.

Among other important enterprises involving the architectural and landscape treatment of large areas may be mentioned the finely monumental plan by Cass Gilbert for the development of the University of Minnesota, following the usual American system of isolated buildings without enclosed courts, and a competition for a garden village for a Masonic Home at Elizabethtown, Pa.

**NEW YORK.** In New York the great Public Library was brought to entire completion except as to some of the interior decorations; the choir of St. John's Cathedral was completed and the furnishings (organs, stalls, etc.) partly installed; the foundations of the great Municipal Offices nearly completed—a gigantic and complex work of engineering; and the magnificent Pennsylvania Terminal brought to completion. This superb structure now stands without a rival in the world among buildings of its kind. The buildings of the Union Theological Seminary (Allen & Collens) were completed and dedicated; they are a distinct architectural adornment to the upper section of Manhattan. In the near neighborhood, Columbia University completed and opened Kent Hall for its Law School, and began the erection of a new Hall of Philosophy, both buildings by McKim, Mead & White.

Among new office buildings the most noticeable were the thirty-one story Whitehall building (Clinton & Russell), and the thirty-two story Liberty Tower (H. I. Cobb). Work was begun on the fifty-four story Woolworth building (Cass Gilbert) which will surpass the Metropolitan Tower in height and will, it is to be hoped, mark the extreme limit of height for such buildings. There has been a remarkable development of business building along Fourth Avenue, and of apartment house building in the neighborhood of Columbia University.

**OTHER CITIES.** In Washington the year witnessed the completion of two interesting buildings; the handsome structure by Kelsey and Cret for the Pan-American Union, and the building for the Society of the Daughters of the American Revolution by E. P. Casey. In Baltimore the new Walters Museum was opened, an unusually elegant design by Delano & Aldrich; and Pittsburg announced the award to Cram, Goodhue and Ferguson of the competition for the First Baptist Church. Another important competition was that in Oakland, Cal., for a new City Hall, awarded to Palmer & Hornbostel, for a striking design recalling somewhat that for the New York Municipal Offices.

In St. Paul and Minneapolis there was considerable important work recorded for 1910; in the first-named city, a building for the Y. W. C. A. by Clarence Johnston, the Hotel St. Paul by Reed & Stern, and a Masonic Temple by Bieker & Orth; in the second, the Plymouth Building (Long, Lamoreaux & Long), St. Mark's Protestant Episcopal Cathedral by E. H. Hewett, a very interesting domical chapel and crematory in Lakewood Cemetery by H. W. Jones, and by the same architect a fine warehouse for Butler Bros. In the same State, Duluth erected from

plans by D. H. Burnham a striking and dignified County Court House.

The record from Chicago includes the completion of the City Hall by Holabird & Roche, forming with the Court House, reported in 1907, a single columnar design, colossal in scale, occupying an entire block; the La Salle Hotel by the same architect, the new Northwestern Railroad Station by Frost & Granger, and many large commercial buildings. From other cities the following buildings have been reported among many others of perhaps equal importance: At Hartford (Conn.), the Morgan Memorial by B. W. Morris; Chelsea (Mass.), a new City Hall by Peabody & Stearns; Portland (Maine), the competition for the New City Hall awarded to Carrere & Hastings, Stevens & Stevens; West Point, completion of the impressive Chapel for the Military Academy (Cram, Goodhue & Ferguson); Louisville (Ky.), a group of buildings for the Presbyterian Theological Seminary and a Christian Science Church, both by McDonald & Dodd; San José (Cal.), the State Normal School by W. D. Coates—a somewhat interesting essay in the *Art Nouveau* spirit; Far Rockaway (N. Y.), the Sage Memorial by C. & G. Crane; Garden City (N. Y.), Doubleday & Page's Printing Works, with garden surroundings, by Kirby & Petit. Louisiana announced the passing of an Architects' Registration Law.

**OTHER COUNTRIES.** Australia has chosen a site for a new capital at Canberra, N. S. W., and begun measures for a competition for the layout of the new city. In South Africa, at Bloemfontein, new Law Courts by Hawk & McKinlay, and at Pretoria, Union Government Buildings, by H. Baker, were under erection or recently completed; and the cities of Khartum and Omdurman were being replanned and rebuilt on approved modern lines. In Asia, Calcutta reported the erection of a new Government Press Building at a cost of six and one-half lakhs of rupees; Karachi, a new Municipal Building, by J. E. Wynnes of Edinburgh; and Nagoya (Japan), the holding of an important Industrial Exhibition.

In South America the greatest activity seems to have been in the Argentine Republic, greatly stimulated by the centennial celebrations of the independence of the Republic and by the Exhibition at Buenos Ayres. Besides the buildings of that Exhibition, there was heavy expenditure upon the improvement of the splendid Plaza de Congreso; costly high school buildings were begun at Parana, Santiago de Estero and five other cities, in addition to one completed at Buenos Ayres; and at Samborombón Bay, at the mouth of the Plata, the execution of a vast scheme was begun for the building of a new harbor, town and railway terminal from designs by an English architect, Mr. Peache.

The necrology of 1910 includes the death in England of George Aitcheson, W. R. A., Past President of the Royal Institute of British Architects, at the age of 84; in the United States, of W. G. Preston, F. A. I. A., and of I. M. Clark, A. I. A., both at Boston; of Alfred Stone, F. A. I. A., at Providence; of G. W. Thompson, A. I. A., at Nashville, Tenn., born in England in 1835, the designer of many Catholic churches and schools; and of S. A. Treat, A. I. A., at Chicago, at the age of 71. The death of C. W. Clinton, F. A. I. A., of Clinton & Russell, at New York at the age of 72, removed

one of the charter members of the American Institute of Architects, and one of the greatest of all American designers of office buildings.

**ARCTIC CLIMATE.** See GEOLOGY.

**ARCTIC EXPLORATION.** See POLAR RESEARCH.

**ARGENTINA.** A South American republic extending from the South Atlantic westward to Chile and northward to Bolivia. The capital is Buenos Ayres.

**AREA AND POPULATION.** The republic consists of 14 provinces, 10 territories, and the federal district (city) of Buenos Ayres; the aggregate area is estimated at 1,139,000 square miles. The census of 1895 showed a population of 3,954,911; official estimate of December 31, 1908, 6,489,023; December 31, 1909, 6,805,684. About two-thirds of the inhabitants are foreign-born and children of foreign-born parents. Of the total at the end of 1909, 5,060,900 were reported as of Argentine nationality (by law children born in the republic of foreigners are Argentine); Italian, 843,540; Spanish, 424,086; French, 104,990; British and Irish, 26,324; Austrian, 24,785; German, 23,450. The population per square mile in the most densely inhabited provinces (excluding the federal district) was in 1908: Tucumán, 32.8; Santa Fé, 16; Entre Ríos 14.1; Buenos Ayres, 13.9; Corrientes, 9.8; Córdoba, 8.8. The most important cities, with populations on July 1, 1909, are: Buenos Ayres, 1,200,000 (1,228,955 on September 30, 1910); Rosario, 172,000; Córdoba, 95,000; La Plata, 95,000 (97,006 on June 30, 1910); Tucumán, 66,000; Santa Fé, 48,000; Mendoza, 39,000; Bahía Blanca, 37,755. The over-sea immigrants in 1909 numbered 231,084; of these, 93,528 were Italians, 86,798 Spaniards, 16,475 Russians, 11,765 Syrians, and 4120 French. From 1867 to the end of 1909, the total over-sea immigration amounted to 3,409,340. The notable influence of Italy upon the republic may be inferred from the fact that of the total number 1,892,721 were Italians; Spaniards numbered 882,271, French, 192,436, Russians, 93,349, Austrians, 64,252, Syrians, 60,359, Britons, 44,871, and Germans, 43,856. To the immigrant the government furnishes free transportation to that part of the country where he may choose to settle.

**EDUCATION.** Primary instruction is free, secular, and nominally compulsory. In 1904 about one-half of the inhabitants over six years of age were illiterate, but statistics relating to 1909 show a considerable improvement in the literacy of children of school age (6 to 14). Children of school age in May, 1910, are reported at 1,200,212. There are reported 6371 primary schools, public and private, with 659,460 pupils. Secondary education is controlled by the Federal government. There are 26 lycées, with about 5800 students, and 45 normal schools, with about 4300. In addition some 20 special and technical schools have an enrollment of about 7000. For higher education there are national universities at Buenos Ayres and Córdoba and provincial universities at Santa Fé, La Plata, and Paraná, having an aggregate of some 6000 students. Of these, in 1909, 4364 were enrolled at Buenos Ayres, which is the largest university in South America. The state religion is Roman Catholicism, but religious toleration prevails.

**AGRICULTURE.** During the last 15 years agricultural development has proceeded at an ex-

traordinary rate, though, chiefly on account of drought, the crop returns for the year 1908-9 (the last for which official reports are available) show in general some decrease as compared with those of the preceding year. For 1895 there were reported under cultivation 4,892,004 hectares (1 hectare=2.471 acres), of which 2,040,683 were sown to wheat and 1,244,184 to corn. For the crop year 1908-9, the total area under cultivation was 15,830,563 hectares. Of these, 6,063,100 hectares were sown to wheat, 5,895,373 being harvested and yielding 4,250,086 metric tons; 1,534,300 were sown to linseed, 1,496,691 being harvested and yielding 1,048,852 tons; 2,973,900 were sown to corn, yielding 4,500,000 tons; 441,570 were sown to oats, yielding 464,252 tons; there were sown to wheat, linseed, oats, barley, millet, and rye a total of 8,242,690 hectares, of which 7,797,137 hectares were harvested, yielding 5,739,794 tons. Values of the three most important crops, in thousands of gold pesos, have been as follows for crop years:

Crops	1895-6	1899-1900	1908-9	1909-10
Wheat .....	34,006	70,272	194,356	178,036
Corn .....	24,416	22,743	87,437	113,850
Linseed .....	7,726	11,170	52,063	56,533

In the production of wheat Argentina ranks sixth among the countries of the world, the crop of 1908-9 being about 5.3 per cent. of the world's production; in corn, third (being exceeded by the United States and Austria-Hungary), the yield being about 4 per cent. of the world's production; in linseed, first, the Argentine production being over 35 per cent. of the total. For the crop year 1909-10 there were under cultivation 18,775,672 hectares, as compared with 15,830,563 for 1908-9, although the aggregate sown to wheat, corn, linseed, and oats, 10,869,750 hectares, showed a decrease of 3.2 per cent. The areas sown to the various crops for 1909-10 were: wheat, 5,836,550 hectares; corn, 3,005,000; linseed, 1,455,600; oats, 572,000; grapes, 122,469; sugar (cane), 70,750; barley, 60,011; potatoes, 48,514; millet, 27,922; beans, 26,000; alfalfa, 4,706,530; cultivated grasses, about 2,100,000. Estimates of production in the crop year 1909-10 are: Wheat, 3,825,000 metric tons; corn, 4,500,000; linseed, 800,500; oats, 591,000. On March 17, 1910, the President of the Republic laid the foundation stone of a barrage on the Neuquén River to regulate for irrigation purposes the waters of the Rio Negro.

**STOCK RAISING.** The number of live stock and their values in gold pesos are stated as follows for 1908: Cattle, 26,116,625—413,021,767 pesos; horses, 7,531,376—90,563,807; mules, 465,037—9,926,873; asses, 285,088—1,256,178; sheep, 67,211,754—126,437,993; goats, 3,945,086—3,661,609; swine, 1,403,591—8,895,960. The total value of these animals was 651,764,187 pesos, as compared with 378,926,803 pesos in 1895. Returns of the meat-packing industry for 1909 showed in the freezing and salting establishments a slaughter of 1,150,202 cattle, 2,985,970 sheep, 25,751 hogs, and 666 horses. The salting establishments are in Entre Ríos. What may be termed the neighboring salting establishments of Uruguay slaughtered 754,300 cattle in 1908 and 664,700 in 1909, and of Brazil (Rio Grande), 425,000 in 1908 and 660,500 in 1909.

Isabel of Spain and President Montt of Chile were among the visitors at Buenos Ayres. No Brazilian representative, however, was present, which was one of many signs of strained relations with that country. The explosion of a bomb at the Colón Theatre at Buenos Ayres on June 25 injured several persons. The government took prompt measures against the anarchists and about 100 were arrested on suspicion. A law was enacted empowering the police to transport any anarchist now in their hands. In July diplomatic relations were broken off with Bolivia on account of Bolivian criticism of the Argentine President's award in the boundary dispute between Bolivia and Peru, but they were resumed in December.

The International Agricultural Exhibition was opened at Buenos Ayres in the first week of July. The Exposition of Hygiene and the Railway and Land Transport Exhibition illustrated the recent progress of the country.

The budget presented in August showed a surplus of \$30,000,000 pesos paper, and estimated the revenue for the next year at \$152,000,000, being an increase of \$19,000,000. Another trans-Andine railway to connect northern Argentina with Chile was authorized by Congress in September.

The new President announced a new Cabinet in October.

**ARGENTINE EXPOSITIONS.** See EXPOSITIONS.

**ARGON.** See ATOMIC WEIGHTS.

**ARGYLL, DUKE OF.** See LITERATURE, ENGLISH AND AMERICAN.

**ARIZONA.** A Territory of the Mountain Division of the United States. Its area is 113,956 square miles, of which but 116 square miles are water. The capital is Phoenix.

**POPULATION.** The population of the Territory according to the figures of the Thirteenth Census was 204,364, as compared with 122,931 in 1900 and 88,243 in 1890. The increase in the decade 1900 to 1910 was 66.2 per cent. The population of the larger cities and towns will be found in the article on UNITED STATES CENSUS.

**MINERAL PRODUCTION.** The chief product of the mines of the Territory is copper, although gold, silver and lead are also produced in considerable quantities. The production of copper in 1909 was 291,110,298 fine lbs., as compared with 289,523,267 lbs. in 1908. This gives Arizona second place in the production of copper, being surpassed only by Montana. The production in 1910, according to the preliminary figures of the United States Geological Survey exceeded the output of 1909, and gave Arizona first place among the copper-producing States. The Bisbee district was the largest producer with an output of approximately 145,000,000 lbs., as compared with about 130,000,000 lbs. in 1909. There were produced in the Territory in 1905 1465 tons of lead and 2862 tons of spelter. In 1910 the value of Arizona's gold production, according to the preliminary figures of the United States Geological Survey was \$3,375,256, as compared with a value of \$2,626,800 in 1909. The silver production was 2,835,641 fine ounces in 1910, as compared with 2,523,600 fine ounces in 1909. Arizona also produced clay products, precious stones, tungsten, and a small quantity of zinc.

**AGRICULTURE.** The acreage, production and value of the principal crops in 1909-10 are shown in the following table:

		Acreage	Prod. bu.	Value
Corn,	1910....	12,000	390,000	\$429,000
	1909....	13,000	417,000	417,000
Spring Wheat,	1910....	17,000	379,000	455,000
	1909....	16,000	400,000	556,000
Oats,	1910....	4,000	160,000	144,000
	1909....	4,000	148,000	117,000
Barley,	1910....	34,000	1,224,000	1,102,000
	1909....	32,000	1,280,000	1,126,000
Hay,	1910....	116,000	244,000	3,172,000
	1909....	109,000	360,000	4,608,000

a Tons.

The area of the agricultural land in the Territory is 1,500,000 acres, but the area actually under cultivation is little in excess of 200,000 acres. Cultivation is carried on chiefly by irrigation. For an account of the various projects for the reclamation of arid lands, see IRRIGATION. The cultivation of oranges has been carried on with success and fruits of all kinds, both temperate and sub-tropical, are grown on a small scale. Sugar beets also have been grown successfully and about 4000 acres are under cultivation in this crop. Ostrich raising is an important industry and there was a marked increase in this industry in 1910. Over 6000 birds are kept in the Salt River Valley, more than 80 per cent. of all the ostriches in the country. As to the farm animals, the numbers of cattle and sheep raised in the Territory have increased considerably in the last few years, the increase of sheep being nearly 50 per cent. in the last three years. The wool clipped in 1910 amounted to 4,950,000 pounds.

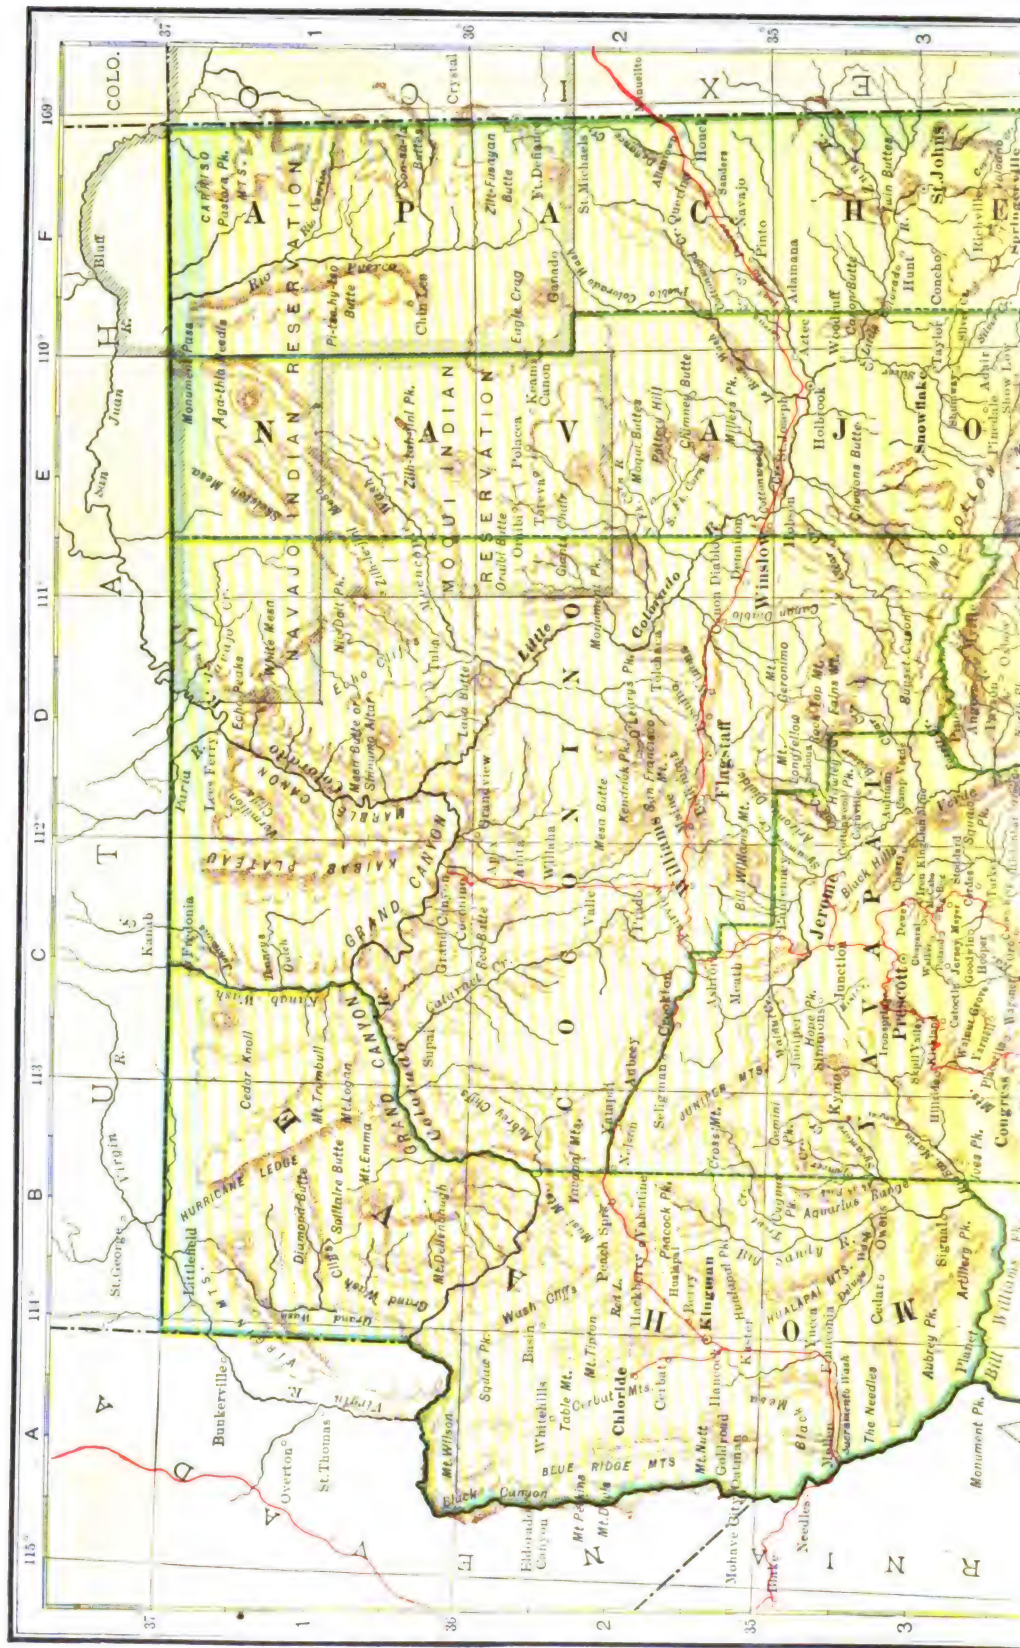

**EDUCATION.** The school children in the Territory between the ages of 6 and 21 in the school year 1909, the latest year for which statistics are available, numbered 36,729. The enrollment was 27,639 and the attendance, 17,863. The average monthly salary of male teachers was \$104.64 and of female teachers, \$79.61. There are normal schools at Tempe and Flagstaff.

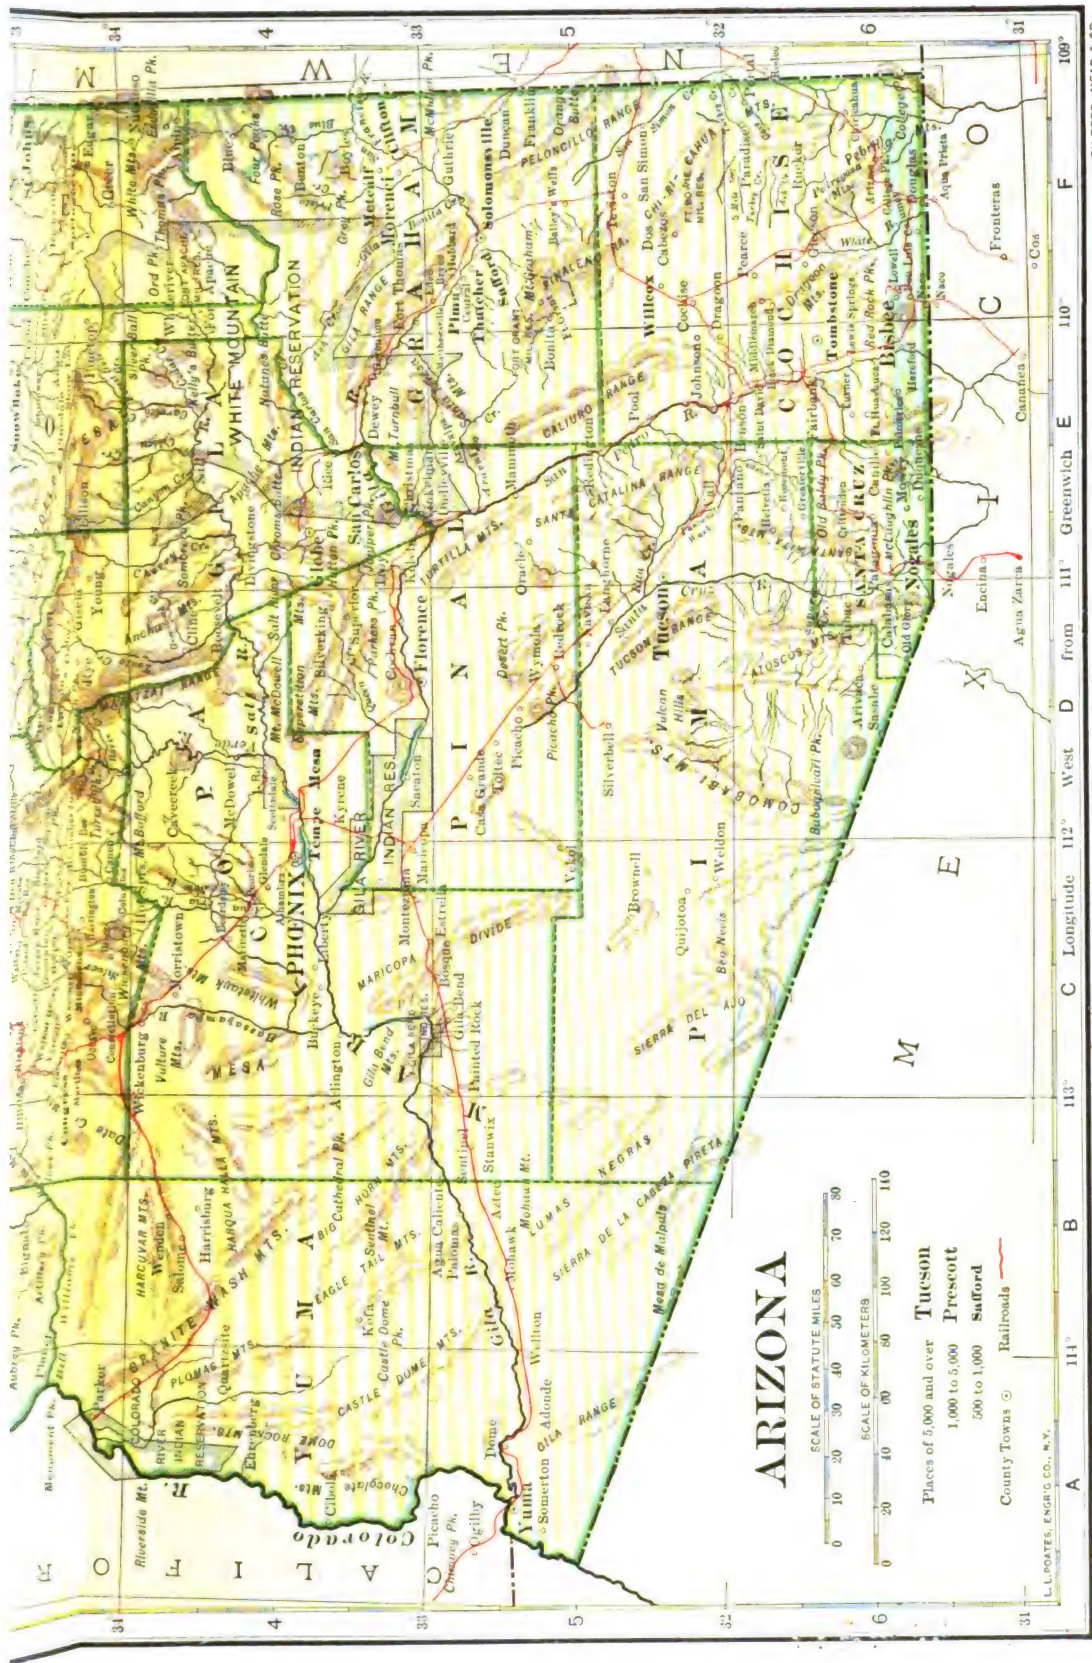

**FINANCE.** At the close of the fiscal year 1910 the cash in the territorial treasury amounted to \$507,721, an increase for the year of \$145,277. The revenues amounted to \$1,121,381 and the expenditures to \$976,103. The territorial debt is \$956,972, and there is owing to cities and counties \$2,098,303, making the total debt of the Territory \$3,055,275.

**CHARITIES AND CORRECTIONS.** The correctional and charitable institutions of the Territory include the Territorial Prison at Florence, Asylum for the Insane and the Territorial Industrial School at Benson. A Home for Aged and Infirm Pioneers is also maintained.

**POLITICS AND GOVERNMENT.** By the approval on June 20, 1910, of the Enabling Act, the citizens of the Territory were assured of the final consummation of their long struggle for admission to the Union as a State. By the provisions of this Act the Governor of the Territory was to call for an election to elect delegates for the preparation of the Constitution within thirty days of its approval. This election was held on September 12. The result of the election for delegates showed that the Territory, unlike New Mexico, was Democratic in its political complexion. Forty-four Democrats and eight Republicans were elected delegates to prepare the Constitution. The chief issue in the campaign for the election of these delegates was the initiative and referendum. This measure had the support of the Democratic party in the Territory and it is thus assured a place in the Constitu-

COPYRIGHT, 1907, BY DODD, MEAD & CO.

tion. The convention had sixty days for its session. In thirty days more the citizens of the State voted for a ratification of the Constitution.

The indications from the proceedings of the convention were that the Constitution would contain, in addition to the initiative, referendum and recall, other provisions even more radical. It was well known that President Taft had strong objection to such a Constitution, as he had already strongly opposed the Constitution of Oklahoma, upon which the Arizona Constitution was, to some extent, based. For this reason there were fears that the Constitution might not be accepted by the President and Congress. No elections were held in Arizona for territorial officers during the year as by a previous Act of Congress the former officers continued until the final acceptance of the Constitution. The fact that the legislature of the new State will be Democratic insures the presence in the Senate of two additional Democratic Senators.

**ARKANSAS.** One of the West South Central Division of the United States. It has an area of 53,335 square miles, of which 810 square miles are water. Its capital is Little Rock.

**POPULATION.** The population of the State, according to the Thirteenth Census was in 1910, 1,574,449, as compared with 1,311,564 in 1900 and 1,128,211 in 1890. The growth in the decade 1900 to 1910 was 20 per cent. The State ranks twenty-fifth in point of population, the same relative rank which it held in 1900. The population of the larger cities and towns will be found in the article UNITED STATE CENSUS.

**AGRICULTURE.** The acreage, production and value of the principal crops in 1909-10 are shown in the following table:

		Acreage	Prod. bu	Value
Corn,	1910....	2,884,000	69,216,000	\$40,145,000
	1909....	2,800,000	50,400,000	36,288,000
Winter Wheat,	1910....	195,000	2,710,000	2,547,000
	1909....	151,000	1,721,000	1,893,000
Oats,	1910....	172,000	4,730,000	2,176,000
	1909....	164,000	3,739,000	2,266,000
Rye,	1910....	2,000	24,000	24,000
	1910....	60,000	2,400,000	1,680,000
Rice,	1909....	28,000	1,120,000	1,008,000
	1910....	31,000	2,604,000	2,213,000
Potatoes,	1909....	83,000	2,310,000	2,125,000
	1910....	210,000	284,000a	3,124,000
Hay,	1909....	198,000	248,000	2,678,000
	1910....	900	585,000b	93,500
Tobacco,	1910....		815,000c	
	1909....		859,720	

a Tons. b Pounds. c Bales.

**MINERAL PRODUCTION.** The most important mineral product of the State is coal. There were produced in 1909, 2,377,157 short tons, having a spot value of \$3,523,139, an increase of 298,800 short tons in quantity and \$23,069 in value over 1908. Mining in the State in 1909 was not satisfactory either to the operators or the miners. Competition with petroleum and natural gas resulting from the development of the Louisiana and mid-continent fields adversely affected the market for Arkansas coal, and since 1907 has reduced the price from \$1.68 to \$1.48 a ton. In addition to this, whatever benefit may have been gained in 1909 by the recovery from the depression of 1908 was largely offset by a drought which lasted from the 1st of June to the middle of November. This not only created a crop shortage in the State, but affected the demand for fuel and caused a great scarcity of water at the mines and raised the cost of produc-

tion by increasing the expense of providing water for the boilers. There was no shortage of labor in the mines of the State during 1909. According to the reports of the State inspector in the last six months of 1909, 12 men were killed and 34 injured in the coal mines of the State. There is a considerable quantity of iron produced in the State as well as lime and limestone. In 1909 there was a small quantity of lead smelted. There was also a small production of spelter in 1909.

The acreage of corn in the State has almost been doubled within eight years. The acreage in 1910 was slightly in excess of that in 1909, while the production in the former year surpassed that in the latter year by nearly 20,000,000 bushels. A considerable area in the southwestern part of the State is devoted to the cultivation of rice. The acreage in 1910 showed a great increase over that of 1909, while the production more than doubled.

**EDUCATION.** The total school population of the State on June 30, 1910, was 573,842, while the enrollment was 390,987 and the average daily attendance was 255,135. The permanent school fund of the State amounts to \$1,134,500. The funds available for educational purposes in 1910 amounted to \$4,530,131 and the expenditures to \$3,187,082.

The first compulsory attendance laws enacted in the State became effective at the beginning of the school year 1909-10. Two acts were passed by the last General Assembly; one required a minimum attendance for one-half the school term between the ages of 8 and 16 years, and is effective in 31 counties; the other makes the age limit 8 to 14, effective in 9 counties. This leaves 35 counties without compulsory law. These measures resulted in a marked increase in the attendance in both the town and rural schools where these laws applied. The General Assembly also appropriated \$160,000 for the establishment of four agricultural schools in the State, one in each of the four districts. Measures were also enacted making possible consolidation of school districts.

An Education Commission made investigations during the year of the school system of the State and the laws under which it is organized. The first meeting of the commission was held on July 28, 1910, and a preliminary report was issued at the close of the year. The association made many important recommendations leading to the improvement of the educational system and administration in the State. A complete report will be issued later.

**POLITICS AND GOVERNMENT.** The biennial session of the legislature began in January, 1911. This was the first legislature to meet in the new State capital.

**CONVENTIONS AND ELECTIONS.** Governor George W. Donaghey, who was nominated for a second term in the Democratic primary held in March, 1910, over C. C. Kavanaugh, was elected Governor in the September election by a vote of 101,557 to 39,880 for Andrew I. Roland of Hot Spring county, the Republican candidate. The Socialist candidate, Dan Hogan, got 9194 votes. In the March primary the following Democratic candidates for Congress were nominated, all of whom were elected at the November election: First District, R. Bruce Macon; Second District, W. A. Oldfield; Third District, J. C. Floyd; Fourth District, Ben Cravens; Fifth District, H. M. Jacoway; Sixth

District, Joseph T. Robinson; Seventh District, W. B. Goodwin. At the September election an amendment to the Constitution providing for the initiative and referendum was adopted by a vote of 91,383 for to 39,080 against. A constitutional amendment to give cotton mills certain exemptions from taxation got 74,132 votes for to 54,485 votes against, but failed for the want of a constitutional majority.

**OTHER EVENTS.** The Arkansas Supreme Court on February 14, 1910, in case of Arkansas Stove Company v. State, held that the Act of February 1st, 1909, "requiring corporations to pay their employees semi-monthly, is not invalid as restricting the right of such employees to contract with such corporations, and that the Act does not deny the equal protection of the law, since all corporations of the class affected are treated alike under like circumstances."

**STATE OFFICERS:** Governor, George W. Donaghy; Lieutenant-Governor, J. T. Robertson; Secretary of State, Earl W. Hodges; Treasurer, John W. Crockett; Auditor and Insurance Commissioner, J. R. Jobe; Attorney-General, Hal L. Norwood; Superintendent of Education, Geo. B. Cook; Commissioner of Agriculture, Fred H. Phillips; Commissioner of Public Lands, R. G. Dye—all Democrats.

**JUDICIARY:** Supreme Court: Chief Justice, Edgar A. McCulloch; Justices, Samuel Frauenthal, C. D. Wood, William F. Kirby and Jesse C. Hart; Clerk of the Court, P. D. English—all Democrats.

**STATE LEGISLATURE, 1911.** Senate, Democrats, 34; Republicans 1; House, Democrats, 95; Republicans 5; joint ballot, Democrats, 129; Republicans, 6. Democratic majority, Senate, 33; House, 90; joint ballot, 123.

The State representatives in Congress will be found in the article UNITED STATES, section Congress.

**ARMIES.** See MILITARY PROGRESS and articles on countries.

**ARMY MANŒUVRES.** See MILITARY PROGRESS.

**ARSENIC.** The only arsenic produced in the United States in 1909, as in 1908, was that recovered in the form of white arsenic as a by-product in smelting. During the year white arsenic was saved at three smelters, at Everett, Washington, at Anaconda, Montana, and at Midvale, Utah. The total quantity of arsenic saved by these three smelters during 1909 was 1214 short tons, valued at \$52,946. The average price received from the companies ranged from 2.05 to 2.44 cents per pound. The prices around New York averaged three cents per pound. The imports of white arsenic in 1909 amounted to 4036 short tons, valued at \$303,728. There were also imported 183,705 pounds of Paris green and London purple valued at \$20,370. The imports came from Canada, Europe and Mexico.

According to the *Engineering and Mining Journal* the total production of white arsenic in the United States in 1910 amounted to 1326 tons. The producers continued to be the same as mentioned above. The Mexican mines worked only on the richest flue dusts and by no means up to their full capacity. In Canada there were three producers. See ATOMIC WEIGHTS.

**ARSENO-BENZOL** (dioxydiamidoarsenobenzenol; salvarsan; amido-arseno-benzol; "606"). A new arsenic compound discovered by Ehrlich and Hata and believed to be a specific for syphilis.

It was by far the most important contribution to the drug treatment of the disease during the year 1910, and bids fair, according to the most reliable observers, to equal quinine as a benefaction to the human race. Although discovered in 1907, it was not until last year that definite clinical results were announced. The drug owes its popular title "606" to the fact that during several years of experimenting with arsenical compounds, it was the 606th to be tried by the investigators. According to patent specifications, the substance is obtained from nitrophenol arsenic acid, and has the structural chemical formula:  $\text{NH}_2 \cdot \text{OH} \cdot \text{C}_6\text{H}_4 \cdot \text{As} \cdot \text{AsO}_3 \cdot \text{H}_2$ . It is one of the same series of arsenical compounds as atoxyl, advocated by Robert Koch several years ago as a specific for sleeping sickness. Since the recent discovery by Schaudin that syphilis was due to a spirillum, the *Spirochæte pallida* or *Treponema pallidum*, a new impetus was given to the search for a specific against this scourge of the human race. That such a specific is supplied by Ehrlich's remedy all observers seem agreed. It is claimed that a single dose causes the total disappearance of spirochetes from the tissues within a few days, and that healing of ulcerations and other lesions often begins within twenty-four hours. Parasyphilitic diseases, such as locomotor ataxia, as well as the acute and chronic stages of syphilis, are said to be materially benefited. Relapsing fever, another protozoön disease, due to the spirillum of Obermeier, is also cured, according to Iversen, by the new remedy, all spirilla disappearing from the blood after one injection. Whether or not the cure of either disease is permanent, the future alone will show. At any rate, the discovery was received on the Continent with remarkable enthusiasm, and the results thus far reported border on the marvelous. The drug is not yet on the market nor available for general use in America. Considerable care is necessary in its administration. Severe reaction, temporary blindness, convulsions, and other unpleasant symptoms and a few deaths have attended its use, but whether these were due to the drug itself or to a faulty method of preparing it with impure methyl alcohol, is not yet decided. Ehrlich strongly advises against using the remedy except in patients who are sound except for the spirochete infection. Syphilitic nursing infants are best treated through the mother. The drug does not pass through the milk, but "antibodies" are formed in the mother which are equally effective and much safer.

**ARTS AND LETTERS, AMERICAN ACADEMY OF.** A body founded in 1898 by the action of the American Social Science Association, which, at its annual meeting nominated a small group of authors and artists to constitute a national institute of arts and letters. The qualification for membership in this body was to be a notable achievement in art, music or literature, and the membership was limited at first to 150, but afterwards to 250. When the institute had included in its membership a large proportion of the most notable artists and authors of the United States, it declared its purpose of proceeding to an organization of an Academy of

Arts and Letters, the members of which should be chosen from the members of the institute. Seven members were chosen from the National Institute of Arts and Letters and provision was made for a progressive responsibility in the choice of those to be elected later. The first seven members were selected in 1904 and were William Dean Howells, Augustus Saint-Gaudens, Edmund Clarence Stedman, John La Farge, Samuel Langhorne Clemens, John Hay and Edward A. MacDowell. These were empowered immediately to elect eight more members and they chose Henry James, Charles Follen McKim, Henry Adams, Charles Eliot Norton, J. Q. A. Ward, T. R. Lounsbury, Theodore Roosevelt, and Thomas Bailey Aldrich. These fifteen members then proceeded to elect five more, Joseph Jefferson, John S. Sargent, R. W. Gilder, H. H. Furness and John Bigelow. These twenty representatives then elected ten additional, raising the total membership to thirty. The new members chosen were Winslow Homer, Carl Schurz, A. T. Mahan, Joel Chandler Harris, D. C. French, John Burroughs, J. F. Rhodes, E. A. Abbey, Horatio W. Parker and William M. Sloane. The constitution of the Academy declares that its aim is to represent and further the interests of the fine arts and of literature. Fifty is established as the limit of its membership. Elections have taken place at intervals, first to enlarge the membership, and then to fill the vacancies which have been caused by death.

The Academy held a meeting of great interest in December, 1910, at the New Theatre in New York City. This was the second public meeting, the first having been held in Washington in 1909. The President, William Dean Howells, in his opening address defined the scope of the institution. One of the most interesting features of the session was a paper on *Reminiscences of Alexander Dumas*, read by John Bigelow, who shortly before had celebrated his 93d birthday. Mr. William C. Brownell presented the subject of *Criticism*, and Dr. Nicholas Murray Butler made an address on the subject, *The Revolt of the Unfit: Reflections on the Doctrine of Evolution*. At the conclusion of the session the gold medal of the National Institute given annually for work of distinction in some field of art or letters was presented to James Ford Rhodes, the historian, by Dr. Henry van Dyke, the President of the Institute. Other speakers were Percy Mackaye, Hamlin Garland, Loreda Taft, Brander Matthews and William M. Sloane. Hamilton W. Mabie read a series of commemorative papers on members of the Academy who had died during the last few years. The living members in 1910 were as follows:

Edwin Austin Abbey, Charles Francis Adams, Henry Adams, John Bigelow, Edwin Howland Blashfield, William Crary Brownell, John Burroughs, George Washington Cable, George Whitfield Chadwick, William Merritt Chase, Kenyon Cox, Henry van Dyke, Daniel Chester French, Horace Howard Furness, Basil Lanneau Gildersleeve, Arthur Twining Hadley, Thomas Hastings, Thomas Wentworth Higginson, William Dean Howells, Henry James, Robert Underwood Johnson, Henry Cabot Lodge, Thomas Raynesford Lounsbury, Hamilton Wright Mabie, Alfred Thayer Mahan, Brander Matthews, John Muir, Thomas Nelson Page, Horatio William Parker, James Ford Rhodes, Theodore Roosevelt, John Singer Sargent, William Milligan Sloane, Francis Hopkinson Smith, Abbott Handerson

Thayer, Elihu Vedder, Andrew Dickson White, Woodrow Wilson, George Edward Woodberry.

The deceased members are: Thomas Bailey Aldrich, Samuel Langhorne Clemens, Francis Marion Crawford, Richard Watson Gilder, Daniel Coit Gilman, Edward Everett Hale, Joel Chandler Harris, John Hay, Bronson Howard, Joseph Jefferson, Henry Carey Lea, Edward A. MacDowell, Charles Follen McKim, Donald Grant Mitchell, Charles Eliot Norton, Augustus Saint-Gaudens, Carl Schurz, Edmund Clarence Stedman, Mrs. Julia Ward Howe, William Vaughan Moody, John Quincy Adams Ward, Winslow Homer, John La Farge.

**ASBESTOS.** The United States has for years led all other countries in the manufacture of asbestos goods, but the raw asbestos for factories has been almost wholly imported from Canada. According to the United States Geological Survey a change appears to have taken place in this condition, in view of the decided increase in 1909 in the production in the United States of a grade of asbestos which is only comparable to that of 1909. Prior to 1908 all of the asbestos mined in the United States was of the amphibole type, but in 1908 and 1909 the output not only increased four-fold over that of 1907, but the increase was almost wholly in chrysotile asbestos. Apart from the increased production in the United States, the principal feature in 1909 was the combination of interests. A number of chief producers whose mines were located in Canada and largely owned in the United States entered into the formation of The Amalgamated Asbestos Corporation, Limited, and will, it is believed, have a controlling interest in the production and sale of asbestos. The total production in the United States for 1909 was 3065 tons, an increase of more than 200 per cent. over the output of 1908. Practically only two States, Vermont and Georgia, furnished asbestos to commerce during 1909, both with increased production. Georgia furnished the amphibole and Vermont the more valuable chrysotile type, and a small quantity was reported from Idaho and Wyoming.

The value of the imports of asbestos in 1909 was \$1,233,659 of which \$993,278 was for unmanufactured asbestos and \$240,381 for manufactured asbestos. The greater portion of the amount imported was from Canada, but a small amount was imported from Germany, United Kingdom, Russia and Italy.

**FOREIGN PRODUCTION.** There were produced in Canada in 1909 63,349 short tons valued at \$2,284,587. In addition there were produced 23,951 tons of asbestic valued at \$17,188. There were ten companies working in the asbestos district of Canada, with 19 quarries and mills, employing in the summer season over 3000 persons.

Russia is becoming an important producer of asbestos, but owing to difficulties of mining and transportation in the Urals, where the mines occur, only the better grades reach the general markets. The production was about 15,000 short tons in 1909.

The production of asbestos in South Africa showed an increase in 1909. It amounted to about 2000 tons.

Deposits of asbestos are reported to have been found in Australia. A small quantity is mined in Japan, France, Italy, Corsica, Greece, Turkey, and Ceylon.

**ASTRONOMY.** The year 1910 will be memorable as the year of Halley's Comet and the Daylight Comet. The expectations of the general public, however, were hardly realized in the case of the former. The photographic exploration of the heavens proceeded with customary vigor, but was not rewarded with so many or such important discoveries as have marked the past few years. The falling off in the number of new minor planets announced was especially noticeable. Among the more striking discoveries of the year were three new stars, *Nova Sagittarii* No. 2, *Nova Aræ*, and *Nova Lacertæ*. The results of the observations on Mars during the opposition of 1909 were made known, and indicated that some remarkable changes had taken place in the configuration of the planet's surface, but the question as to whether the canals are objective or subjective phenomena is still unsettled.

THE CONFERENCE OF THE INTERNATIONAL UNION FOR SOLAR RESEARCH, which was held at Mount Wilson, California, on August 31 and September 1 and 2, was an event of great importance. Among the most important business transacted by the Conference was the establishment of a system of secondary standards of wave-length; a resolution to include the whole field of astrophysics within the scope of the Union's activity was also adopted.

THE SUN. In 1907, Halm published the results of his spectrographic determination of the period of rotation of the sun, and called attention to certain irregularities in the displacement of the spectrum lines at the sun's limb. Some of the lines were found to have suffered a displacement which was independent of that due to the rotation. Professor W. S. Adams, who has been investigating this phenomenon for several years, published the results of his observations with the Mount Wilson 30-foot spectrograph used in connection with the great tower telescope. He found that the lines of scandium, titanium and vanadium were less displaced than those of iron and nickel, and that the lines of elements of very high atomic weight, such as lanthanum and cerium, showed very small displacements. The lines showing small displacements were in general those which

were considerably strengthened at the limb, the intensification being probably a temperature effect. Comparison of laboratory spectra with those of the sun indicated that the relative displacements were caused by pressure, a conclusion which was recently confirmed independently by Perot.

Dr. Nordmann, revising his earlier calculations of the intrinsic brightness of the sun, found for its value 100,500 decimal candles per square centimetre, or only one-third of the value previously found by him.

A total eclipse of the sun took place on May 9. Although Tasmania was the only country passed over by the line of totality, and the conditions for viewing the eclipse were very unfavorable on account of the low altitude of the sun at the instant of totality, Mr. Frank McClean fitted out an expedition for the purpose of observing the eclipse. The expedition, however, was a total failure owing to the unfavorable weather, which completely prevented the observers from seeing the sun.

Very little activity of the solar disc was recorded during the year; the sunspot cycle having apparently settled definitely towards its minimum. However, one large group of spots, the length of which was about one-seventh of the solar diameter, or 120,000 miles, was developed during the latter half of February, but did not persist very long. At one time the group was easily visible to the naked eye. Several groups of moderate size were also observed about the middle of May.

Dr. Frederick Slocum, of the Yerkes Observatory, recorded the appearance of two remarkable prominences on the sun's limb in March and April. The first, which was first seen on March 4, was remarkable from the fact that it lasted until April 28, a period of about fifty-five days. Its height varied between 8000 miles and 50,000 miles. The other prominence was first noticed on March 24 and lasted about 24 hours only; but, during its brief existence, it appears to have been the seat of unexampled activity. When first photographed, it had a height of about 30,000 miles, and rapidly grew until it reached a height of over 200,000 miles, when the whole mass became detached and floated away, leaving no trace.

JUPITER. Attention was directed in the YEAR BOOK for 1909 to Professor Lowell's confirmation of Mr. Scriven Bolton's discovery of a network of wisp-like lacings connecting the north and south equatorial belts. In June, 1910, Professor Lowell announced that similar networks had been observed at his observatory at Flagstaff, Arizona, between all the belts of the planet.

Mr. Scriven Bolton recorded the recurrence of the acceleration of the Red Spot due to the rapid passage of the Great South Tropical Dark Area past the Spot. He also called attention to a new formation on the surface of the planet in the shape of an oblique belt stretching across the whole zone between the S. Temperate and the S. S. Temperate belts.

MARS. The favorable conditions obtaining during the opposition of this planet during 1909 led to a number of important observations and discoveries. The observers, however, are still divided into two camps—those who consider the canals as purely objective phenomena, due possibly to the agency of intelligent beings, and those who look upon them as largely subjective,

and due to the physiological merging of alignments of spots into apparently continuous lines on the planet's surface.

One striking phenomenon, viz., the apparent veiling of the surface of the planet, was noticed by all observers during the earlier part of the opposition. As the result of this veiling, many of the details of the surface could not be distinguished during the summer months. It was suggested by M. Antoniadi, of the Juvisy observatory, that the indistinctness of the markings was caused by the interposition of very light cirrus clouds of yellow color in the atmosphere of the planet. As it seems to be generally conceded that some aqueous vapor is present in the Martian atmosphere, Antoniadi's suggestion would appear to be warranted.

Professor Lowell recorded the occurrence of the first snowfall of the Martian Antarctic region on November 17, 1909, or nearly two months after the summer solstice. Several new canals, notably two lying to the east of the Syrtis Major, were also discovered by him, and their occurrence was later confirmed by several European observers.

An interesting theory as to the origin of the various features of the surface of Mars was published by Krebs in the *Astronomische Nachrichten*. He suggested that the various new features discovered in 1909 were due to volcanic action, and that the network of canals was analogous to the network of seismic and volcanic tectonic lines of the earth's surface.

**NEW STARS.** Three new stars were discovered this year. Two of these, *Nova Sagittarii* No. 2 and *Nora Aræ*, were found by Mrs. Fleming on plates taken at Arequipa during the early part of the year. *Nora Aræ* increased in brilliancy from the twelfth to the sixth magnitude between March 19 and April 4. Its brightness then began to decline, and about the end of the year it was only of the tenth magnitude. The third new star, *Nora Lacertæ*, was discovered by the Rev. T. E. Espin, of Walsingham, England, a few days before the end of the year. When it first appeared, it was possible to observe it with the naked eye, but it soon began to lose in brilliancy.

**COMETS.** The periodic comets due to return in 1910 were Tempel II, D'Arrest's, Swift's (1895 II), Brooks's (1889 V), and Faye's. The discovery of Halley's Comet, which was due to pass through perihelion this year, was noticed in the *YEAR BOOK* for 1909. Of the above comets all but Tempel's and Swift's were reported.

Comet Tempel II, with a period of 5.28 years, was first observed at Milan in July, 1873. It was seen again in 1878, 1894, 1899 and 1904, its last perihelion passage having occurred on November 10, 1904. It should therefore have been seen in February of this year, but failed to reappear.

Swift's Comet (1895 II), with a period of 7.06 years, was also due at perihelion at the beginning of the year, but, owing to its being unfavorably placed for observation, it was not detected.

D'Arrest's Comet, first discovered in 1851, was seen in 1857, 1870, 1877, 1890, and 1897, but, on account of its unfavorable position, was not found in 1903. Its period is 6.67 years. This year it was first detected by M. Gonnessiat at Algiers on August 26. It appeared as a feeble nebulosity with a slight central condensation of the fourteenth magnitude.

Brooks's Comet (1889 V), with a period of 7.1 years, was discovered by Messrs. Aitken and Wilson at Mount Hamilton on September 28. Its magnitude was 13. According to an ephemeris published by Dr. Bauschinger, it was nearest to the earth about the beginning of August, but it will not pass through perihelion until January 8, 1911. This comet is of special interest owing to its having once thrown off four fragments some of which became brighter than the parent body. At the time of its last perihelion passage on December 6, 1903, it was single.

Faye's Comet, originally discovered in November, 1843, made its last perihelion passage on March 19, 1896. Although it had been observed at all of its previous reappearances, it was not seen in 1903. Its period is 7.44 years. Its orbital eccentricity is exceptionally small, and its perihelion distance is great, being about 1.7 times the mean distance of the earth from the sun. It is also remarkable as having been the first comet whose period was determined directly by calculation instead of by comparison with the records of its earlier apparitions. When first observed by Cerulli at Teramo on November 8, it was a body of about the tenth magnitude and had a faint condensation. Its perihelion passage took place on September 15.

The above comets are designated 1910c, 1910d, 1910e, respectively.

Two new comets were discovered: First, 1910a. When first discovered by three railway officials at Kopje, Orange Free State, in the early morning of January 16, this comet already had a head five minutes in diameter, and a well-developed tail, fan-shaped in appearance and about one degree in length. It was distinctly visible to the naked eye. It increased rapidly in brightness until it became as bright as Mercury and could easily be seen when within 4 degrees of the sun. It passed through perihelion on January 17. In a few days it became a brilliant object in the evening sky, but it very soon decreased rapidly in brightness. Owing to a mistake in the telephonic message by which its discovery was announced at Johannesburg, it was at first known as Drake's Comet. It is remarkable that on several previous occasions the reappearance of Halley's Comet has been marked by the apparition of another bright comet. 1910a is known as the Daylight Comet, also as the Worrrell-Innes Comet, after two astronomers who made the first announcement of its position. 1910b, a comet of the eleventh magnitude, was discovered by the Rev. Joel H. Metcalf at Taunton (Mass.) on August 9. It presented no remarkable features, declining rapidly in brightness after discovery.

On February 20, the announcement of the discovery of a new comet, almost coinciding in position with Halley's Comet, was made by M. Pidoux of the Geneva Observatory. No confirmation of the report could be obtained from any other observatory, and the announcement was attributed to some curious mistake on the part of M. Pidoux. During its short life this comet was known as 1910b, the designation afterwards assigned to Metcalf's comet.

Daniel's Comet (1909e), which was at first supposed to belong to the family of comets associated with the planet Uranus was shown on closer observation to belong to the Jovian family of short period comets.

**HALLEY'S COMET.** As already recorded in the YEAR BOOK for 1909, Halley's comet was first detected photographically by Wolf at Heidelberg on September 11, 1909, almost exactly in the position predicted by the English astronomers, Cowell and Crommelin. It was not until more than a month later that it was observed visually.

The past apparitions of the comet have been so often associated with events of world-wide importance, and on several occasions it has been such a brilliant object in the heavens, that popular interest became greatly aroused in anticipation of the present reappearance. Observations of the spectrum of the comet showed the presence of cyanogen in the tail, so that when it was announced that the comet would probably transit across the sun's disc on May 18 and that it would approach so close to the earth that the latter would probably be enveloped by the tail, a good deal of fear on the part of the more ignorant was excited, and many curious devices for escaping the deadly cyanogen gas were reported.

During January, photographs taken at the Lick Observatory showed the presence of a tail about a degree in length. At the beginning of February, there was a very fine sharp nucleus of stellar form and the tail formed a narrow sharply-defined cone. A little later, probably owing to a sudden burst of activity, the tail consisted of several fine streamers radiating from the head. By the middle of February, the comet had increased in brightness to such an extent that it could be distinguished with the naked eye. During the latter part of March and the first two weeks of April, it was so near the sun as viewed from the earth that it was invisible. When it became visible again, it was situated in the morning sky. It passed through perihelion on April 19, at which time the head appeared about as bright as a star of the second magnitude. As the date of its transit across the sun's disc approached, the comet increased in brightness, and the tail lengthened until on May 13 it stretched through an arc of forty degrees. In spite of the most elaborate preparations for the observation of the transit, the head of the comet could not be detected as it passed over the sun's disc. On May 19, it was confidently expected that the comet would be seen in the evening sky, but Professor Barnard reported that he saw the tail shortly before sunrise. Stretching through an arc of more than 100 degrees, it presented a glorious spectacle. It was not until May 20 that the comet appeared in the west, and it was then so diminished in size and splendor that it proved to be a great disappointment to the many who had waited until then to see it. The weight of evidence is in favor of supposing that the tail was so greatly curved that its passage past the earth was delayed by from 40 to 60 hours. As by that time the earth was some four million miles south of the plane of the comet's orbit, it is extremely probable that the tail did not envelop the earth at all, or at least only in its outer portion. After May 20 the comet lingered in the sky for a few weeks as a naked-eye object, but it soon became too faint to be distinguished except with the aid of a telescope. The attempt to connect the comet with terrestrial phenomena occurring during its transit failed. See article on METEOROLOGY.

Considering the long period—some 2000

years—during which the comet has returned regularly to the sky, it is highly probable that the nucleus contains a large amount of solid matter, for only a solid could lose the amount of matter which must have been poured forth by the head of the comet during that time. The solid matter must, however, be in comparatively small masses, for otherwise it would have been visible while crossing the sun's disc.

A series of photographs of the comet taken about May 23 by Professor Lowell showed the presence of four knot-like formations in the tail which were probably due to separate outbursts of energy. Measurements from plates taken at different times showed that these knots were moving away from the head at the rate of 13.6, 17.2, 19.7 and 29.7 miles per second respectively, showing that the velocities of the particles as they receded were being accelerated.

The following list gives the recorder returns of Halley's comet, with the dates of perihelion passage as computed by Cowell and Crommelin:

B. C.	240	May 15	A. D.	912	July 20
	163	May 20		989	Oct. 9
	87	Aug. 15		1066	Mar. 27
	12	Oct. 8		1145	Apr. 6
A. D.	66	Jan. 26		1222	Sept. 10
	141	Mar. 25		1301	Oct. 22
	218	Apr. 6		1378	Nov. 8
	295	Apr. 7		1456	June 8
	373	Nov. 17		1531	Aug. 25
	451	July 3		1607	Oct. 26
	530	Nov. 15		1682	Sept. 14
	607	Mar. 26		1759	Mar. 12
	684	Nov. 26		1835	Nov. 15
	760	June 15		1910	Apr. 19
	837	Feb. 25			

It is worthy of note that the period of revolution just completed was the shortest of record.

**COMETS' TAILS.** The well-known fact that, in the neighborhood of perihelion, the tail of a comet is directed away from the sun led Kepler, almost three hundred years ago, to the idea that the tail was due to a pressure exerted by the sun's rays upon the vapors given out by the head of the comet. Additional weight was given later to the idea by Fitzgerald who sought to explain the repulsive effect by Maxwell's light-pressure. In so doing, he considered that the gaseous molecules behaved in respect to light waves like absolutely black spheres of considerable size. It was shown by Schwarzschild, however, that for small spheres diffraction would become significant, and he calculated the effect of the pressure of light on small perfectly reflecting spheres. The general problem was solved by Debye, so that it became possible to submit the effect of light-pressure on cosmical dust, first suggested by Arrhenius, to accurate quantitative measurement. This was done by the American physicists, Nichols and Hull, in masterly experiments. From its spectroscopic behavior, however, it is evident that the matter in a comet's tail does not consist of small solid particles, but of separate fluorescing gaseous molecules, which must be treated as resonators with selective absorption. By a series of very ingenious and delicate experiments, which he described in the *Astrophysical Journal*, Lebedew succeeded in showing that a translatory force is exerted by a beam of light upon a gas, and that it is directly proportional to the amount of incident energy and to the coefficient of absorp-

৯৭৬

tion of the gas. Although the numerical values found for gases at atmospheric pressure cannot be applied directly to such extremely tenuous gases as are known to exist in the tails of comets, still they form a striking confirmation of the theory and afford a basis for its further elaboration.

**MINOR PLANETS.** The extraordinary activity in the photographic exploration of the heavens, which resulted in the discovery of between three and four hundred minor planets during the years 1903, 1907 and 1908, appears to have well nigh exhausted the number discoverable in this way. In 1909 the number of minor planets announced as new amounted to only 92, or about fifty short of the number announced in 1908. The year 1910 witnessed a still further reduction in the number of discoveries, only 46 having been reported. These were provisionally designated by the letters JH to LC. Of the total number, 23 were reported from the Königstuhl Observatory, Heidelberg, by Professor Max Wolf (3) and his assistants, Helffrich (17), and Ernst (3). Of the remaining 23, no less than 16 fell to the share of the Rev. Joel Metcalf of Taunton (Mass), four to Cerulli of Teramo, and one each to Palisa of Vienna, Baillaud of Paris, and Davidson of Greenwich. Of the three discoveries by Wolf, two, JL and JN, were found to be identical with (294) *Felicia* and (273) *Atropos* respectively, while two of those announced by Cerulli, viz., KR and KZ, proved to be (216) *Kleopatra* and (62) *Erato*, respectively. KY, reported by Metcalf, was doubtfully identified with (580) 1905 SE. The number of new discoveries not certainly identified with the discoveries of previous years was therefore 42. From past experience some of these will in all probability prove to be bodies already known, but it is beyond doubt that the total number of known minor planets is now considerably in excess of seven hundred.

Permanent numbers ranging from 675 to 691 were assigned to the following minor planets:

1908 DU (=675).

1909 FN (=676). FR, FS, FY (*Pax*), GW, GZ, HA, HC, HD, HE, HF, HG (*Tinette*), HH (*Mélanie*), HJ, HZ (*Wratislavia*), JG (=691, *Lehigh*).

In addition to the planets in the above list which have been named, the following have also received names: (671) 1908 DV=*Carnegie*, 1908 CS=*Nesstor*, and 1910 KU=*Interamnia*.

1909 HL has been identified with (138) *Tolosa*.

**MOUNT WILSON SOLAR OBSERVATORY.** Professor George E. Hale, in his annual report to the Carnegie Institute of the work accomplished at this observatory, gave a summary of the principal results obtained by himself and his assistants. Among the more noteworthy of these results may be mentioned the following: The existence of magnetic fields in sunspots, to which reference was made in the YEAR BOOK for 1908, has been established beyond doubt through the detection of all the characteristic phenomena of the Zeeman effect. These magnetic fields are in all probability due to the rapid revolution of electrically-charged particles in the sunspots, which thus form electrical vortices. The rotation in these vortices was found to be in opposite directions in the northern and southern hemispheres, although some exceptions to the rule were detected. A new index to the solar activity was obtained

from the areas of the calcium flocculi as determined by the spectroheliograph. These, when compared with the simultaneous variations in the earth's magnetic intensity, gave reason for supposing that there was some general relationship between the solar activity and the terrestrial magnetic activity, but no quantitative relationship could be detected. It was found that the "flash" spectrum, of the lower chromosphere, hitherto photographed only during a total eclipse of the sun, could be photographed in full sunlight, whenever the instrumental and atmospheric conditions were favorable, with the 30-foot spectroheliograph of the tower telescope. On account of the high dispersive power of this instrument, a far higher degree of accuracy than has been possible from eclipse observations has been obtained in the measurements of the wave-lengths of the lines.

The performance of the 60-inch reflector, which was completed and first used for visual and photographic observation in December, 1908, was found to surpass all expectations. Photographs of nebulae made with it brought out many details hitherto undetected, notably a remarkable spiral structure near the center of the Great Nebula in Andromeda. This nebula was found to give a distinct solar spectrum, and, as it is known to be enormously distant, it was suggested that it consisted possibly of a countless swarm of solar stars, so closely crowded together as to be indistinguishable with any telescope. Other investigations on the *Andromeda* nebula and on distant star clusters confirmed Kapteyn's observation that there exists a selective absorption of light in space, violet light being slightly more absorbed than red light as it is transmitted through space. The degree of redness, as expressed by the difference in brightness estimated photographically and visually, was found to increase by one per cent. (equivalent to a stellar magnitude of nine thousandths) for a distance of 100 light years. As the results obtained with the *Andromeda* nebula and with three star-clusters were of entirely different orders of magnitude, the estimation in this way of the relative distances of objects whose parallaxes and proper motions are too small to be detected seems to be one of the possibilities of the near future. Photographs of stellar spectra made with an 18-foot spectrograph and the 60-inch reflector, were on a sufficient scale to permit the determination of the pressure in the atmosphere of Arcturus. Observations on the spectrum of the zodiacal light showed strong evidence in support of the theory that the light is merely reflected sunlight.

**INTERNATIONAL UNION FOR COÖPERATION IN SOLAR RESEARCH.** The fourth meeting of the Union was held at Mount Wilson, California, on August 31, and September 1 and 2, under the auspices of the Solar Observatory of the Carnegie Institution. It was attended by a large number of the leading astronomers and solar physicists of both Europe and America. The business of the meeting was devoted chiefly to the discussion and adoption of the reports of the various committees. Of first importance was the report of the committee on the determination of standard wave-lengths. This committee, adopting as its primary standard the wave-length of the red cadmium line as determined by Michelson and more recently confirmed by Fabry and Perot, has established a

system of secondary standards of extreme precision, and has taken steps for the immediate determination of a set of intermediate tertiary standards which may be relied upon for comparison or interpolation by observers even when using prismatic dispersion. It was recommended that, in the region of the spectrum in which three independent measurements by the interferometre method, are available, i. e., between  $\lambda 4282$  and  $\lambda 6494$ , the arithmetic mean of the three measurements should be adopted as a definite international standard of the second order, provided that there is sufficient agreement between them. In this way, a list of forty-nine secondary standards was made up, the values adopted being based upon the determinations of Fabry and Buisson at Marseilles, Eversheim at Bonn and Pfungst at Baltimore. As an indication of the degree of accuracy attained, it may be mentioned that the average differences of the three determinations were, in most cases, not more than one part in a million. In the neighborhood of the sodium line, where the character of the iron lines is not satisfactory, the use of certain barium lines as additional standards was proposed. It also recommended that the secondary system be extended so as to include lines of longer and shorter wave-length than those included in the region referred to above. The new system of standards will be known as the International System, the unit on which it is based being called the "international Ångström" (I. A.), as defined by the conference of 1907. The committee on the investigation of sun-spot spectra recommended that, notwithstanding the progress of photographic work in this field, visual observations of spot spectra should be continued upon a revised and extended plan. Other important recommendations were made by the committee on measurement of solar radiation, on the determination of solar rotation by means of the displacement of lines, on the organization of eclipse observations, and on spectroheliograph work. It was voted to extend the scope of the Union's activity so as to include general astrophysics. The next conference of the Union will be held at Bonn in 1913.

**MOTION OF THE SOLAR SYSTEM.** In a contribution to the *Astrophysical Journal*, Professors Frost and Kapteyn discussed the sun's velocity through space as derived from the radial velocities of Orion stars. They found evidence of the two streams of stars which for some years have been the subject of the researches of Kapteyn and others. The velocity relative to the stars near the apex was found to be 18.38 km. per second, while relative to the stars near the antapex, it was 28.38 km. per second. The mean of the two velocities was 23.3 km. per second.

Professor Boss published the results of his investigation of the proper motions of more than 5000 stars uniformly distributed over the whole sky, and deduced therefrom the position of the solar apex. This was found to be in R. A., 270.52°, decl. = +34.28° for the epoch 1875. By making other selections of stars, such as those of different magnitudes, or of proper motion, he found no sensible modification of these values. Professor Boss claimed that his results strongly discounted the idea of there being two great definite streams as held by Kapteyn, Eddington, Dyson and others, and that the motions of the stars are quite haphazard in their distribution.

**OTHER EVENTS.** The Janssen Medal of the French Academy of Sciences was awarded to Professor W. W. Campbell of the Lick Observatory for his spectroscopic discoveries and his numerous investigations in that branch of astronomy.

**BOOKS.** Among the more important works published during 1910 may be mentioned the following: Lowell, *The Evolution of Worlds*; Newcomb, *Popular Astronomy*; Mason, Smith and Elkins, *Parallax Investigations*; Perrine, *Determination of the Solar Parallax*; Dyson, *Astronomy, A Handy Manual*; Brown, *Halley's Comet; Its History*.

**ASTROPHYSICS.** See ASTRONOMY.

**ATHENS.** See ARCHÆOLOGY.

**ATHLETICS.** **TRACK AND FIELD.** Several new records were made in track athletics in 1910. The best work was done by the two runners—George V. Bonhag and Melvin W. Sheppard, both members of the Irish-American A. C. Between them they set up new figures for nearly every distance from 500 yards to 5 miles. The majority of these distances are not regarded as "standard," as they do not usually appear on athletic programmes. Sheppard's most notable feat was the running of 1000 yards in 2 minutes 12 2-5 seconds, excelling by 3-5 seconds the time made by "Lon" Meyers in 1881. Bonhag's best performance was on the indoor tracks. He ran 2 miles in the record time of 9 minutes 14 1-5 seconds. T. S. Berna of Cornell University ran the same distance out doors in 9 minutes 26 3-5 seconds, also establishing new figures. Among the sprinters, the best showing was that of R. C. Craig of the University of Michigan, who at the intercollegiate games held at Philadelphia covered 220 yards in 21 1-5 seconds, equalling the world's record made by B. J. Wefers in 1896. Leland S. Scott of Stanford, Cal., raised the pole vault record for height to 12 feet 10 7-8 inches and M. J. McGrath threw the 56-pound weight to a height of 16 feet 6 1-4 inches.

The senior championships of the American Athletic Union were held at New Orleans on October 14 and 15. The Irish-American A. C. of New York won, scoring 49 points as against 48 totalled by the New York A. C. Other teams and their scores were: Chicago A. A., 18 points; Olympic A. C., San Francisco, 9; and Illinois A. C., Chicago, 6. The Irish-American A. C. was also victorious in the junior championships, held at the same place and time, with a total of 51 points. The Chicago A. A. finished second. The contest for the all-round championship of the Union took place at Chicago on August 13. It was won by F. C. Thomson of Los Angeles, who scored a total of 6991 points. The record for this event is held by Martin J. Sheridan, who in 1909, made 7385 points.

The thirty-fifth annual track and field meet of the Inter-Collegiate Amateur Athletic Association was held on Franklin Field, Philadelphia, on May 27 and 28. The largest number of points was scored by the University of Pennsylvania, which had a total of 27 1/2. Yale was a close second with 25 1-2 while Michigan took third place with 20. Other colleges scoring points were: Princeton, 17; Cornell, 14; Harvard, 13 1-2; Syracuse, 8; Amherst, 6; Brown, 3; Dartmouth, 3; Columbia, 2 1-2; and New York University, Bowdoin and Wesleyan 1 each. Only one new record was made, that being the per-

formance of R. C. Craig in the 220 yard run, which has already been referred to and which bettered the former intercollegiate figures by 1-5 second.

The University of Notre Dame won the tenth annual meeting of the conference colleges, held at Champaign, Ill., on June 4, scoring 29 points. Other point winners were Leland Stanford, 17; Chicago, 13; Illinois, 12; California, 12; Washington, 10; Oberlin, 10; Wisconsin, 9; Minnesota, 5; Kansas, 5; Iowa, 3; Colorado College, 3; Western Reserve, 2; South Dakota, 1.

A noteworthy feature of the English championships which were held at Stamford Bridge, London, on July 2, was the showing made by F. L. Ramsdell, the University of Pennsylvania athlete, who captured both the 100-yard dash and the 220-yard run. Another outsider, K. de Szathmary of Hungary, won the pole vault contest. Of interest abroad also was the international meeting between athletes representing Scotland and Ireland, which took place at Ibrox Park, Glasgow, Scotland. Of the eleven events contested, Scotland was the victor in nine.

**ATOMIC WEIGHTS.** In the fall of 1910 the International Committee on Atomic Weights adopted the following values for general use during the year 1911:

Element.	Symbol.	Atomic weight.
Aluminum	Al	27.1
Antimony	Sb	120.2
Argon	A	39.88
Arsenic	As	74.96
Barium	Ba	137.37
Bismuth	Bi	208.0
Boron	B	11.0
Bromine	Br	79.92
Cadmium	Cd	112.40
Cæsium	Cs	132.81
Calcium	Ca	40.09
Carbon	C	12.00
Cerium	Ce	140.25
Chlorine	Cl	35.46
Chromium	Cr	52.0
Cobalt	Co	58.97
Columbium	Cb	93.5
Copper	Cu	63.57
Dysprosium	Dy	162.5
Erbium	Er	167.4
Europium	Eu	152.0
Fluorine	F	19.0
Gadolinium	Gd	157.3
Gallium	Ga	69.9
Germanium	Ge	72.5
Glucinum	Gl	9.1
Gold	Au	197.2
Helium	He	3.99
Hydrogen	H	1.008
Indium	In	114.8
Iodine	I	126.92
Iridium	Ir	193.1
Iron	Fe	55.85
Krypton	Kr	82.92
Lanthanum	La	139.0
Lead	Pb	207.10
Lithium	Li	6.94
Lutecium	Lu	174.0
Magnesium	Mg	24.32
Manganese	Mn	54.93
Mercury	Hg	200.0
Molybdenum	Mo	96.0

Neodymium	Nd	144.3
Neon	Ne	20.2
Nickel	Ni	58.68
Nitrogen	N	14.01
Osmium	Os	190.9
Oxygen	O	16.00
Palladium	Pd	106.7
Phosphorus	P	31.04
Platinum	Pt	195.2
Potassium	K	39.10
Praseodymium	Pr	140.6
Radium	Ra	226.4
Rhodium	Rh	102.9
Rubidium	Rb	85.45
Ruthenium	Ru	101.7
Samarium	Sa	150.4
Scandium	Sc	44.1
Selenium	Se	79.2
Silicon	Si	28.3
Silver	Ag	107.88
Sodium	Na	23.00
Strontium	Sr	87.63
Sulphur	S	32.07
Tantalum	Ta	181.0
Tellurium	Te	127.5*
Terbium	Tb	159.2
Thallium	Tl	204.0
Thorium	Th	232.4
Thulium	Tm	168.5
Tin	Sn	119.0
Titanium	Ti	48.1
Tungsten	W	184.0
Uranium	U	238.5
Vanadium	V	51.06
Xenon	Xe	130.2
Ytterbium (Neoytterbium)	Yb	172.0
Yttrium	Yt	89.0
Zinc	Zn	65.37
Zirconium	Zr	90.6

\* Browning's and Flint's investigations led to their announcement in 1910 of 124.3 as the final figure, but at the September meeting of the International Committee on Atomic Weights it was decided that this required further corroboration and that the old figures should be used during 1911.

**AUCKLAND, N. Z.** See BRIDGES.

**AUCKLAND PIER.** See DOCKS AND HARBOURS.

**AUSTIN, H. H.** See LITERATURE, ENGLISH AND AMERICAN, section *Travel and Description*.

**AUSTRALIA, COMMONWEALTH OF.** A British dependency consisting of a federation of six original states. The temporary seat of the Federal government is Melbourne, Victoria. The permanent capital will be laid out at Canberra in the state of New South Wales.

**AREA AND POPULATION.** The estimated area of the commonwealth in square miles and the population (exclusive of aborigines), according to the census of March 31, 1901, and the latest estimates available, are shown in the following table, by states:

States	Sq. mi.	Pop., '01	Pop., '09-'10
New South Wales	310,372	1,354,846	1,662,367*
Victoria	87,884	1,201,070	1,297,557†
Queensland	670,500	498,129	578,548†
South Australia	903,690	363,157	412,808†
Western Australia	975,920	184,124	282,856*

Commonwealth	2,974,681	3,773,801	4,421,000†

\* June 30, 1910. † Dec. 31, 1909. ‡ On Dec. 31, 1909, 4,374,138.

The aborigines are thought to number about 30,000. Capital cities, with estimated population, including suburbs, December 31, 1909: Sydney, N. S. W., 605,900; Melbourne, Victoria, 562,300; Adelaide, S. A., 184,393; Brisbane, Q., 143,077; Perth, W. A., about 55,000; Hobart, T., about 45,000. Population of other cities, with suburbs (1908): Newcastle, N. S. W., 64,270; Ballarat, V., 48,063; Bendigo, V., 44,510; Broken Hill, N. S. W., 41,610; Geelong, V., 28,361; Launceston, T., 24,536; Charters Towers, Q., 20,976. In the table above, the figures for South Australia include those of the Northern Territory (est. area, 523,620 square miles; est. population December 31, 1908, 3360). In 1910 the Federal Parliament passed a bill providing for the transference of the Northern Territory from the jurisdiction of South Australia to that of the Commonwealth and pledging the Federal government to build a railway connecting the South Australian system with Port Darwin. The territory of Papua (q. v.), or British New Guinea, is an Australian dependency.

For 1908 the number of births, deaths, and marriages and the excess of arrivals over departures were as follows:

	Births	Deaths	Mar.	Exc. A.
N. S. W.....	42,525	16,090	12,642	12,906
Vict. ....	31,101	15,767	9,334	—1,751
Qu. ....	14,828	5,680	4,909	3,276
So. A. ....	9,756	3,834	3,112	1,209
No. T. ....	34	83	10	—155
W. A. ....	7,754	2,882	2,012	2,105
Tas. ....	5,616	2,129	1,432	—1,669
Total .....	111,613	46,465	32,551	15,921

Totals for 1909: Births, 114,071; deaths, 44,172; marriages, 33,775; excess of arrivals over departures, 28,933.

**EDUCATION.** Public education is under the control of the separate states. Primary instruction is free and compulsory. The statistics by states are as follows:

*New South Wales* (1909): State schools, 3215, with an enrollment of 238,514 pupils and an average attendance of 160,080. State expenditure on education, science, and art, £1,314,402. The University of Sydney, with 1324 students, in 1909 receives a state subsidy. Private schools, 789, with 58,361 pupils; 18 schools not included above, with 1721 pupils; and various business schools. *Victoria* (1908): State schools, 2017; enrollment, 233,893; expenditure (1908-9), £963,615. There are various institutions for special and technical instruction, and the University of Melbourne, with 1059 students in 1909. *Queensland* (1909): Public schools, 1164; teachers, 2521; enrollment, 106,772; average attendance, 69,755; expenditure, £361,053. Grammar schools, 10; teachers, 69; pupils, 1218; government aid, £10,354. Private schools, 158; teachers, 688; pupils, 14,745; average attendance, 12,579. *South Australia* (1909): State schools, 690; teachers, 1438; enrollment, 59,622; expenditure, £161,146. Private schools, 200; teachers, 718; pupils, 9321. The University of Adelaide had 697 students in 1909. *Western Australia* (1908): State schools, 423; enrollment, 30,010. There are a few technical schools, etc. State expenditure (1909-10), £184,694. Private schools (1907), 102; enrollment, 7639. *Tasmania* (1908): State

schools, 365; enrollment, 27,760; private primary schools (1907), 204; enrollment, 8630. There are a number of superior and technical schools.

**MINERALS.** Australia is rich in many minerals and ores, but her gold production is of preponderating importance. The output of gold in 1909 and from the beginning of gold mining to the end of that year was as follows: New South Wales, £869,546, and from 1851, £57,189,272; Victoria, £2,778,956 and, from 1851, £285,100,389; Queensland, £1,935,178 and £70,225,250; Western Australia, about £6,773,500 and, from 1886, about £91,741,900. Gold production in 1908: N. S. W., 224,792 fine oz., valued at £954,854; V., 670,910 oz., £2,849,838; Q., 465,085 oz., £1,978,554; W. A., 1,647,911 oz., £6,999,882; S. A. proper, 2898 oz., £12,300; Northern Territory, 5644 oz., £23,943; Tasmania, 57,085 oz., £242,482; total Commonwealth, 3,074,325 oz., £13,058,853; total in 1909, 2,961,665 oz.

Mining statistics by States: *New South Wales* (1909). Total value of minerals raised, £7,403,210, of which coal accounted for £2,618,596, silver, silver-lead, and ore £1,653,615, and gold £869,546. *Victoria* (1908). Total value, £3,031,044 (gold £2,849,838, coal £64,953); total value to end of 1908, £289,019,563 (gold £282,321,433). *Queensland* (1909). Total value £3,656,564 (gold £1,935,178, copper £853,196, coal £270,726, tin £244,927, silver £99,093, lead £68,543); total in 1908, £3,844,487 (gold £1,975,554, copper £882,901, tin £342,191). *Western Australia*. Various ores occur, but the only mining of great importance is that of gold, notably at the Coolgardie group of mines. Gold production in 1908, 1,647,911 oz.; 1909, 1,595,269 oz.; first seven months of 1910, 855,372 oz.; total, from 1886, 22,460,339 oz. *South Australia*. Copper, gold, silver, lead, coal and other minerals occur. Total production in 1907, £913,863 (copper £714,525, gold £36,602). Gold in 1908, £36,243. *Tasmania*. The most important minerals are shown in the following export values for 1908: Copper, £545,327; tin, £400,196; silver, £370,477; gold, £292,691.

**AGRICULTURE.** Land under tillage, exclusive of grass-grown lands, in the year 1908-9: New South Wales, 2,713,971 acres; Victoria, 4,496,183; Queensland (1908), 650,472; South Australia proper, 3,442,295; Western Australia (1908), 494,987; total, 12,067,354. The following tables show the acreage and production of the principal crops in 1908-9 (for Queensland the calendar year 1908):

	Wheat		Oats	
	Acres	Bu.	Acres	Bu.
N. S. W.....	1,394,056	15,483,276	59,881	1,119,113

	2,927,184	10,547,951	87,044,061	695,772

The production of butter in the Commonwealth in the year 1909-10 is stated at 153,730-522 pounds; cheese, 15,712,141; the wool export, at 677,195,061 pounds.

Potatoes, 128,631 acres, 396,920 tons (Vic., 152,840; Tas., 117,786); hay, about 2,446,500 acres, about 3,096,915 tons; vines, about 61,000 acres, about 6,537,000 gals. of wine; green forage, 871,728 acres. The following figures, subject to slight revision, show production in the Commonwealth in the year 1909-10: Wheat, 90,413,597 bushels (acreage, 6,580,473); oats, 14,716,345 bu.; corn, 10,658,393 bu.; hay, 3,150,000 tons; potatoes, 378,877 tons; sugar-cane, 1,294,575 tons

Some details by States are: *New South Wales*. In 1909-10, 3,174,691 acres were under cultivation, the chief products being: Wheat, 28,532,029 bu.; corn, 6,986,000; oats, 1,966,186; potatoes, 89,000 tons; tobacco, 6494 cwt.; sugar-cane, 131,081 tons; citrus fruits, 654,001 cases; wine (1909), 736,262 gals. Livestock (December 31, 1909): 604,776 horses; 794,543 dairy cattle; 2,223,161 other cattle; 46,187,678 sheep; 237,849 swine. Animal products (1909): Wool, 370,808,000 lbs. (stated as in the grease), valued at £13,128,000; tallow, 638,400 cwt., £795,700; butter, 62,865,608 lbs.; cheese, 4,775,268 lbs. *Victoria*. In 1909-10: Under cultivation, 4,834,285 acres (2,097,162 wheat, 384,226 oats, 864,359 hay); wheat yield, about 28,940,000 bu.; wine, 991,941 gals. Figures for various crops, not given in above tables, for 1908-9: Rye, 32,504 bu.; peas and beans, 197,807 bu.; potatoes, 152,840 tons; onions, 487,680 cwt.; hay, 1,415,746 tons; 561,679 cwt. (205,300 for wine); wine, 1,437,106 gals. Livestock, March 31, 1910: 442,829 horses; 625,063 dairy cows (producing during the year past 55,166,555 lbs. butter and 5,025,834 cheese; other cattle, 924,577; sheep, 12,937,983; swine, 217,921. Slaughter in 1908: 3,309,865 sheep and lambs, 279,710 cattle and calves, 225,162 swine. Wool production, 88,434,296 lbs. in 1906-7, 93,082,341 in 1907-8, 87,536,451 in 1908-9 (stated as in the grease). *Queensland*. The following figures relate to the calendar year 1909. Under cultivation, 738,447 acres (of which 131,657 fallow); wheat, 117,160 acres, 1,571,589 bu.; corn, 132,313 acres, 2,508,761 bu.; potatoes (about one-half sweet), 10,706 acres, 26,576 tons; sugar-cane, 128,178 acres (of which 80,095 crushed), 1,163,569 tons of cane, 134,584 tons of sugar (151,098 in 1908); bananas, 4994 acres, 1,396,567 bunches; pine-apples, 2161 acres, 712,474 doz.; oranges, 3298 acres, 396,599 bu. Livestock: 555,613 horses, 4,711,782 cattle, 19,593,791 sheep, 124,803 swine. Wool production, 129,668,298 lbs. (stated as in the grease). Slaughter, 185,220 cattle, 553,742 sheep, 9514 calves, 12,118 lambs, 37,205 swine. *South Australia*. Area under cultivation in the

year 1909-10, 3,754,094 acres (of which 1,395,798 were wheat, 424,448 hay, 85,346 oats, 41,895 barley, 8131 potatoes, 20,353 vines, 1,198,450 fallow). Wheat yield, 25,133,851 bu. Wine export (1909), 1,045,678 gals. Various fruits are produced. Wool export (1909), 46,523,849 lbs. *Western Australia*. This State owes its development chiefly to the gold mines, and its agriculture is hardly comparable with that of the states treated above. The wheat acreage, however, increased from 284,357 in 1908-9 to 448,918 in 1909-10. Tasmania. Figures for acreage and production in 1910 are not available. In the preceding year 269,446 acres were under crop, and 491,423 under artificially sown grass.

COMMERCE. Imports and exports of the Commonwealth have been valued as follows:

	1904	1908	1909
Imports .....	£37,020,842	£49,786,798	£51,171,896
Exps. domestic .....	55,100,167	62,118,903	.....
Exps. foreign .....	2,385,748	2,192,155	.....
Exps. total ....	57,486,919	64,311,058	65,318,836

The total imports and exports in 1907 were valued at £51,809,033 and £72,824,247 respectively. Leading imports in 1907 and 1908:

	1907	1908
Metal manufactures .....	£5,004,983	£4,948,342
Cottons and linens .....	3,626,658	8,270,147
Machinery, etc. ....	2,760,211	2,587,253
Apparel, etc. ....	3,255,058	2,381,520
Iron and steel .....	2,388,697	2,267,983
Woolens .....	2,349,285	2,006,880
Drugs, chemicals, etc. ....	1,840,933	1,916,680
Timber .....	1,632,055	1,894,340
Silks (incl. velvets) .....	1,753,908	1,812,786
Paper .....	1,233,504	1,383,449
Oils .....	1,049,491	1,036,652
Spirits .....	1,023,984	1,028,825
Sacks, etc. ....	1,113,197	988,166
Tea .....	1,152,727	972,756
Gold bullion .....	1,426,827	950,575
Ry. iron, rails, etc. ....	628,931	792,928
Tobacco .....	753,809	778,314

The more important exports in 1907 and 1908 were valued as follows:

	1907	1908
Wool .....	£28,391,830	£22,914,236
Gold specie .....	5,411,572	10,438,665
Wheat .....	4,801,722	3,098,591
Butter .....	2,890,261	2,387,450
Copper and ore .....	3,601,812	2,223,544
Gold in matte .....	.....	2,218,859
Skins and hides .....	2,782,805	2,195,053
Gold bullion .....	4,036,067	1,670,314
Spelter, etc. ....	1,478,664	1,512,328
Coal .....	1,299,052	1,348,926
Lead—pig and in matte ..	1,549,022	1,346,488
Mutton .....	1,377,502	1,219,107
Silver bullion .....	1,191,907	1,076,069
Flour .....	1,296,252	1,034,308
Tin and ore .....	1,444,953	1,023,440
Timber .....	776,921	1,017,548
Silver in matte and ore ..	.....	987,415
Tallow .....	1,017,047	785,996
Leather .....	526,229	532,782

For 1909 figures (subject to revision) for the largest exports are: Wool, £25,483,112; gold, £8,950,051; wheat and flour, £7,858,164.

Imports from and exports to the country commercially most important, in thousands of pounds sterling:

	Imports		Exports

**MANUFACTURES.** The following figures, relating to 1908, show the number of establishments, the number of hands employed, and the salaries and wages paid: Working in wood, 1322, 21,310, \$9,352,658; metal works, machinery, etc., 1548, 48,505, \$24,629,205; food and drinks, 2253, 40,652, \$14,864,476; clothing and textiles, 2681, 70,075, \$16,327,165; books, paper, printing, etc., 998, 21,448, \$9,243,753; vehicles, saddlery, harness, etc., 1105, 10,784, \$3,697,951; heat, light and power, 313, 5786, \$3,499,966; ship and boat building, 76, 2278, \$1,340,613; drugs, chemicals and by-products, 153, 3086, \$1,167,691; all other, 2415, 33,602, \$12,653,843; total: establishments, 12,859; hands, 257,526; wages, \$96,777,321; value of lands and buildings, \$130,848,558; value of machinery, etc., \$126,337,766.

**SHIPPING.** In 1907, vessels entered in overseas trade, 2210, of 4,472,066 tons, and cleared, 2184, of 4,350,800 tons; in 1908, entered, 2022, of 4,295,679 tons (2,377,121 British), and cleared, 2029, of 4,285,472 tons (total entered and cleared, 8, 581,151); in 1909, total, 8,516,751. The chief ports in order of their volume of trade are Sydney, Melbourne, Adelaide, Brisbane, Fremantle, Hobart, and Albany.

**COMMUNICATIONS.** The following table, relating to the government railways for the year ended June 30, 1908, shows the mileage open, together with the total cost of construction and equipment, and the receipts and working expenses (in thousands of pounds sterling):

	Miles	Cost		Rec'ts	Exps.
		1907	1908		
N. S. W.....	3,472.5	45,683	4,944	2,715	
Vict. ....	3,896	41,929	3,873	2,436	
Qu. ....	3,359	22,576	1,951	1,054	
S. A. ....	1,879	13,910	1,741	970	
N. T. ....	145.5	1,180	14	14	
W. A. ....	1,943	10,733	1,502	1,008	
Tas. ....	463	3,978	278	202	
Total .....	14,658	139,988	14,304	8,398	

Reported government mileage open, June 30, 1909, 15,064; in addition, 1332.5 miles of private lines (of which 798 in Western Australia); total, 16,396.5. Plans were making in 1910 for the construction of a trans-continental railway. Telegraph (1908): Lines, about 49,750 miles; wires, about 161,800 miles; offices, 3411. Post-offices (1908), 7780.

Further details: *New South Wales.* On June 30, 1910, government railway, 3643 miles; private, 81.5 miles; other private lines connected with mines, 190 miles; post-offices, 2397. *Queensland.* On December 31, 1909, government railway, 3532 miles; telegraph lines, 10,439 miles; wires, 22,197 miles; post-offices, 1378. *South Australia.* On December 31, 1909, government railway, 1888 miles (and 145.5 miles in the Northern Territory).

**FINANCE.** Commonwealth revenue and expenditure for fiscal years ended June 30: 1908, £15,019,034 and £6,162,129 respectively; 1909, £14,349,835 and £6,419,364; 1910, £15,538,440 and £7,407,866. Surplus is paid over to the states. In the fiscal year 1910, £11,593,050 was derived from customs and excise. There is no Federal debt.

State finances relating to fiscal year ended June 30, 1909 (Queensland, December 31):

	Rev.	Exp'nd.	Debt.
N. S. W.....	£13,625,071	£12,882,607	£90,307,419
Vict. ....	8,247,684	8,240,177	54,567,197
Qu. ....	4,884,310	4,809,960	41,568,827
S. A. ....	3,551,189	3,259,417	30,436,183
W. A. ....	3,816,316	3,906,744	21,951,753
Tas. ....	934,405	960,237	10,134,914

In the fiscal year 1910, revenue and expenditure in New South Wales were £14,540,073 and £13,038,150 respectively, and the public debt at end of the year, £92,525,095; in Western Australia, £4,274,422, £4,060,620, and £23,287,453. The state debts have been incurred largely for the construction of railways and other public works.

**ARMY AND NAVY.** The military establishment comprised 12,000 as a garrison force in peace and war, and a field force with a strength of 6500 light horse, 24 guns, and 7500 infantry with 36 guns, and a war establishment of double that number. The total, including the garrisoned troops, would have in time of peace, a strength of 26,000 and in time of war, 40,000. In addition there would be the following partially trained troops: light horse, 7000 (approximately); cadets, 9103, and rifle club members, 28,721. The Australian Defense Act of 1909 aimed to enforce the principle of compulsory service between the ages of 12 and 26 in three classes: first, junior cadets, 12 to 14; second, senior cadets, 14 to 18; and third, troops of the National Guard, 18 to 26. The numbers in these services were not determined because the carrying out of the Defense measure was held in abeyance until Lord Kitchener should inspect Australian military conditions and offer his advice as to a plan. This advice was given in 1910,

and for an account of the plans under consideration, see below, paragraphs on *History*.

The Commonwealth navy consisted of 11 small cruisers distributed as follows: Queensland, two harbor defense vessels, one second-class torpedo boat and one picket boat; South Australia, one small cruiser and one second-class torpedo boat; Victoria, one armor-clad vessel of 3480 tons, two first-class torpedo boats and two second-class torpedo boats. In 1909 contracts were placed in Great Britain for three torpedo boat destroyers, and the first of these was launched on the Clyde in February, 1910, and the second in April. In 1909 the Commonwealth government offered the Imperial navy an armored cruiser of the improved *Indomitable* type. Work was begun on the vessel in June, 1910. It was to be named the *Australia*.

**GOVERNMENT.** The executive authority is vested in a Governor-General, who is appointed by the Crown and is assisted by a responsible ministry. The legislative power devolves upon a parliament of two houses, the Senate (36 members, 6 from each state) and the House of Representatives (75 members). The states are represented in the lower House in proportion to population. Members of both Houses are elected by universal adult suffrage. There are separate state parliaments, which are elective; but the state Governors are appointed by the Crown. Governor-General in 1910 (from September 8, 1908), the Earl of Dudley. Ministry (constituted April 29, 1910): Prime Minister and Treasurer, Andrew Fisher; Minister of Defense, George Foster Pearce; Trade and Customs, Frank Gwynne Tudor; Foreign Affairs, Egerton L. Batchelor; Home Affairs, King O'Malley; Postmaster-General, J. Thomas; ministers without portfolio, Edward Findley and Charles E. Frazer.

#### HISTORY

**RECENT POLITICAL EVENTS.** After the general election of December, 1906, Mr. Alfred Deakin, who had been chief of the Cabinet since July, 1905, continued in office. The Deakin government was obliged to depend on the Labor Party for support. This alliance lasted till November, 1908, when, the Labor members having withdrawn, the Deakin Ministry was overthrown, and a Labor Ministry under Mr. Fisher as Premier succeeded, but on the opening of Parliament, May 26, 1909, the Fisher Ministry was in turn defeated by a coalition of the three opposition groups. This new coalition Ministry under Mr. Deakin, consisting chiefly of Moderates, succeeded at the end of May. The policy of the Deakin government comprised the following features: The maintenance of the present protective tariff; a Federal Interstate Commission, to decide questions of wages referred to it by the State arbitration courts or wage boards; universal military training; coast defense; recognition of Imperial responsibilities; and postponement of the financial question impending between the states and the Commonwealth. It also promised the appointment of a High Commissioner to London. Important questions before the country in 1909 were those of military and naval defense and of a new fiscal arrangement between the Commonwealth and the states. As to military defense the government's plan comprised compulsory training of cadets between the ages of twelve and twenty and of citizens, the cadet training to begin in 1911 and the citizen training in 1912. The militia was to be

recruited only from these trained bodies. A naval defense bill framed in accordance with the advice of the Imperial Conference of 1909 and providing for one *Indomitable*, three protected cruisers, six destroyers, three submarines, and auxiliary vessels, was passed by Parliament toward the end of 1909; also a Naval Loan bill authorizing a loan to carry out this shipbuilding programme. A new fiscal arrangement with the States was necessary because payments under the "Braddon Clause" of the constitution would cease in 1911. This clause provided that during the first ten years of the Commonwealth the states should receive at least three-fourths of the Commonwealth's customs and excise revenues and as much more as the Commonwealth did not use. At the Melbourne conference of the State Premiers in August it was agreed that instead of three-fourths of the revenues the states should receive 25s. per capita of population. A Financial Arrangement bill providing for the necessary amendment of the constitution to admit of this per capita payment and also to authorize Federal assumption of state debts was thereupon drawn up by the Commonwealth government and was passed by Parliament in November.

**GOVERNMENT POLICIES.** On February 7, 1910, the programme of the government was discussed in a speech by Premier Deakin, in which he emphasized the duty of electors to vote for the financial agreement between the states. He said that upon the ratification of the present States' Debt bill a Royal Commission would consider the best means of consolidation, and that the result would be a decrease in the interest. He declared that the government hoped for further preferential trade treaties. A bill would be proposed providing for the appointment of an interstate commerce commission, with duties corresponding to those of the British Board of Trade. A bill for taking over the Northern Territory would again be brought in by the government. As to the land defense plan, the government was taking measures to bring it into effect, and in accordance with Lord Kitchener's advice, favored the building of transcontinental railways to Perth and Port Darwin. Military and naval colleges and small arms and cordite factories were being established. The postal contract with Great Britain, which had recently gone into effect, was working well. Lord Kitchener's recommendations for Australian defense were published in February. His scheme comprised an army of 80,000 men on a peace footing, consisting of 40,000 in garrison and 40,000 mobile troops, a war strength of 107,000, the establishment of a military college like West Point, and the division of the country into military areas, each to provide a quota. The total cost during the seventh year after the plan went into effect was estimated at £1,884,000. As to the financial agreement between the states the government answered its critics in the Labor party, saying that the policy of that party tended to starve the state finances by its tendency toward unification, its centralizing industrial legislation and its seizure of state sources of income by taxing land.

**GENERAL ELECTIONS.** The main contentions of the Labor Party in the general elections, which were held on April 13, were the application of the principle of "new protection" by means of the Federal Arbitration Court, the nationalization of monopolies, and the imposi-

tion of a graduated land tax. It also bitterly attacked the government's scheme for turning over from the Commonwealth to the states for an indefinite period an annual sum amounting to 25s. per head of the population, proposing instead a limitation of 10 years. On the other hand, the government offered a promise of anti-trust laws in place of the nationalization of monopolies and demanded that the new protection be secured through the Interstate Commission instead of the Federal Arbitration Court. Other features of the Labor programme were the maintenance of a White Australia; the establishment of a citizen defense force based on compulsory service and an Australian squadron to be built out of the revenue; a Commonwealth bank; the restriction of public borrowing; a navigation measure on the principles of the bill framed by the previous Fisher Ministry; the amendment of the Arbitration act, and insurance against unemployment. The additional features of the government's programme were special insistence on the Interstate Commission, tariff readjustment, preferential arrangements with other colonies, the defense scheme, the assumption of the Northern Territory, the establishment of a Federal agricultural bureau, the building of transcontinental railways, the navigation measure as amended by the Board of Trade, an electoral bill aiming at majority rule and measures for the codification and unification of the commercial law.

The results of the election were as follows: Labor Party, 44; Fusion, 20; Independent Liberals, 2; total, 75. Thus the Labor Party obtained a majority of 10 in the Senate and 13 in the House. On the meeting of the Cabinet on April 19, Mr. Deakin, the Prime Minister, resigned, and on the following day, Mr. Fisher, the labor leader, was sent for to form the new Ministry. Two questions were submitted by referendum: The first, whether the Commonwealth should assume the states' debt, was answered affirmatively, and the second, relating to the fixing of the financial relations between the Commonwealth and the states, was negative.

The latter measure proposed that the Commonwealth should return to each state annually from the customs revenue 25s. per head of the population instead of 75 per cent. of the customs receipts collected in the states' territories, which the states under the present arrangement were receiving. This was rejected by a majority of 25,000 in a total vote of 1,278,000. The chief measure on which the Labor Party seemed likely to insist was the progressive land tax which they believed would recoup the expenses of their defense scheme and as imposed on country lands would lead to the subdivision of large fertile areas now used for pasture. They also believed in the policy of encouraging immigration on a large scale.

PARLIAMENT. At the end of April, Mr. Fisher reappointed most of the members of the former Labor Ministry. At the opening of Parliament on July 1, the Governor-General's speech outlined the legislative programme. One of its chief features was the progressive land tax, with a £5000 limit, the basis of the tax being a reasonable market value of the land. Other features were the introduction of a Commonwealth note issue as legal tender; the confirmation of the grant of 25s. per head to the states for ten years, special arrangements being made in the case of Western Australia; the repeal of

the Naval Loan act; encouragement of immigration, and amendments of the defense act of 1909; the introduction of bills dealing with navigation, quarantine, railway building, tariff correction; improvements in the electoral and immigration laws; government control of wireless telegraphy, the acquisition of the Northern Territory, and a state-owned telegraph service with Great Britain. It was announced that constitutional amendments would be submitted to a referendum. These were to deal with an extension of the Federal powers over trusts, corporations, monopolies and combinations. The government also declared in favor of a policy for increasing the amount of fertile land available to immigrants. The new Navigation bill passed the first reading in the Senate toward the end of August.

In July the bill for the payment of a grant amounting to 25s. per head of the population to the states for ten years, passed the House and in the latter part of August it passed the Senate. The repeal of the Naval Loan act was passed by both Houses in August.

The government set forth its plans in some detail in connection with the budget speech on September 7. Premier Fisher announced that the estimates for the revenue and expenditure for 1910-11 balanced at £16,841,000. A large expenditure would, he said, be involved in the taking over and development of the Northern Territory. As to the government plans, he announced that penny postage would be established on May 1, that plans for the Western Australian Transcontinental Railway would be introduced into the next session of Parliament, that the state debts would be soon taken over, and that a referendum would be taken on the question of altering the constitution with a view to giving the Commonwealth equal legislative powers with those of the states in the matter of trade disputes. Finally, the government promised to submit proposals for the removal of tariff anomalies and for general tariff revision. In September the bill for the Commonwealth note issue passed both Houses. It called for a gold reserve of 25 per cent. on a total issue of £17,000,000 and 100 per cent. reserve on anything beyond that. The government had previously announced that it would not appropriate to Federal expenditures the gains of the note issue, but would invest them to the best advantage. The Land Tax bill provided for a progressive tax on unimproved land, with an extra charge of 1d. in the pound on lands held by absentees. The scale proposed was as follows: Estates up to £5000, free; from £5000 to £15,000, 1d., progressing at the rate of 1d. for every additional £15,000 up to £75,000; £75,000 to £80,000, 5d.; over £80,000, 6d. It was discussed in September and a number of amendments were offered. It was passed in November. In the same month the bill transferring to the Commonwealth the Northern Territory of South Australia passed both Houses. In October the High Court decided against the constitutionality of the common rule provisions in the Commonwealth Conciliation and Arbitration act. Early in November the Commonwealth Parliament passed the two Constitution Amendment bills, submitting to a referendum the question of the Commonwealth control over commercial and industrial matters and the question of the Commonwealth's authority to nationalize monopolies. The Penny Postage bill and the Defense bill, amending the Defense act of 1909, ac-

cording to the Kitchener recommendations, also passed.

Other important events of the year were the opening of a new mail service reducing the time between Australia and England by fifty-eight hours, and the appointment of Sir George Reid as Australian High Commissioner in London. During the latter part of the year there was much discussion of an Imperial Conference and the measures to be laid before it. The Commonwealth government finally agreed on the date for the next meeting of the conference, namely, May 22, 1911.

The tenth anniversary of the Commonwealth was completed at the close of the year. Its achievements were at that time thus summed up:

"(1) The formal acquisition of its own capital site and territory; (2) the attainment of direct control over the Northern Territory; (3) financial independence owing to the expiration of the Braddon clause of the constitution; (4) the assumption of responsibility for self-defense by the commencement of active operations for compulsory training under the Defense Act. The prospects of internal development by immigration, closer settlement, and railway decentralization are now brighter than they have been at any previous period of Federal existence." See also articles NAVAL PROGRESS and EXPLORATION, paragraphs on *Australasia*.

**AUSTRALIAN TARIFF.** See TARIFF.

**AUSTRIA-HUNGARY.** A constitutional monarchy of Central Europe, consisting of the Austrian Empire and the Hungarian Kingdom, united under one sovereign, besides the common territory of Bosnia and Herzegovina (annexed October 5, 1908). The capital of Austria is Vienna, and of Hungary, Budapest.

**AREA AND POPULATION.** The area of Austria is 115,905 square miles; of Hungary, 125,608; of Bosnia and Herzegovina, 19,702; total, 261,215 square miles. According to the census of December 31, 1900, the population of Austria was 26,150,708, and of Hungary, 19,254,559. Included in the figures for Hungary are those for Croatia and Slavonia, with 16,410 square miles and 2,416,304 inhabitants. Emigration from Austria and Hungary respectively: 1907, 177,354 and 209,174; 1908, 56,214 and 45,061; 1909, 143,532 and 128,734. The largest cities, with estimated population December 31, 1908, are: In Austria—Vienna, 2,107,981; Prague, 233,334; Lemberg, 188,566; Gratz, 162,160; Trieste, 223,340; Brünn, 122,725; Cracow, 157,251; in Hungary—Budapest, 935,132; Szegedin, 117,751; Maria-Theresiople, 91,787; Debreczin, 90,808.

**EDUCATION.** Elementary instruction is free and compulsory throughout the monarchy. In Austria there were at the end of 1907 21,478 elementary schools, with 97,019 teachers and 4,152,643 pupils; children of school age, 4,542,666; training colleges, 128. In 1910 gymnasias numbered 278 (95,867 students); realschulen, 144 (47,519). There are various technical, professional, and special schools with a large number of students. Eight universities are maintained by the state.

In Hungary, there were in 1908 2659 infant schools, with 232,140 infants; 19,170 elementary schools, with 43,203 teachers and 2,827,898 pupils; children of school age, 3,573,475; training colleges, 95, with 1143 teachers and 10,724 students; gymnasias, 184, with 3630 and 59,199; realschulen, 44, with 967 and 13,231. The state

maintains three universities, and, as in Austria, there are many special and technical schools.

**AGRICULTURE.** The area in thousands of hectares (2,471 acres) planted to the principal crops, in 1908, and their production in thousands of metric quintals (220.46 pounds) were as follows:

	Austria		Hungary	
	1000 ha.	1000 qu.	1000 ha.	1000 qu.
Rye .....	2,080	28,782	1,113	12,118
Oats .....	1,819	20,912	1,157	10,802

Vines .....	266	8,142*	329	8,024*

\* Thousands of hectoliters of wine.

In Austria in 1908, 1,124,000 hectares under clover produced 3,873,500 metric tons of hay, and 114,538 hectares, 220,878 quintals of seed; 3,435,000 hectares of meadow yielded 8,699,800 tons of hay. Silk cocoons: Austria, 2,180,065 kilogrammes; Hungary, 1,677,000. The hop yield of the monarchy in 1908 was 43,239,240 pounds and in 1909 20,646,780 pounds; in the two years respectively Bohemia produced 31,900,000 and 11,066,000 pounds; all other Austria, 9,338,120 and 7,600,780; Hungary, 2,001,120 and 1,980,000. Crop yields in Hungary proper in 1909 and official estimates for 1910 are reported as follows, in bushels: Wheat, 113,352,000 and 184,789,000 respectively; rye, 44,858,000 and 57,096,000; barley, 71,868,000 and 63,601,000; oats, 92,270,000 and 79,308,000; corn, 161,860,000 and 192,336,000; potatoes, 183,523,000 and 171,902,000. Wheat production of the monarchy in 1909 is reported as follows: Austria, 58,468,000 bushels; Hungary, 113,352,000; Croatia and Slavonia, 12,556,000; Bosnia and Herzegovina, 2,594,000; total, 186,970,000 against 230,577,000 in 1908, 185,217,000 in 1907, and 268,708,000 in 1906.

**MINING.** In Austria, the total value of mining products (exclusive of salt, petroleum, etc.), was 295,486,865 kronen in 1907 and 317,833,337 kronen in 1908; smelting products, 132,807,655 and 136,920,722 respectively. The most important metal is iron, the ore produced in 1908 amounting to 2,632,407 metric tons, valued at 22,629,416 kronen; pig iron, 1,466,897 tons, valued at 117,158,715 kronen, against 109,696,000 kronen in 1907, 83,227,000 in 1905, and 82,304,000 in 1900. The values of other raw metals and of coal produced are reported as follows, in thousands of kronen:

	1900	1905	1907	1908
Zinc .....	3,164	5,283	6,178	5,916
Lead .....	4,722	4,810	6,993	4,716
Silver .....	3,908	3,754	4,131	3,414
Mercury ....	2,495	2,551	2,487	3,035
Copper .....	1,538	1,508	1,649	1,060
Coal .....	95,591	99,875	129,493	139,716
Lignite .....	112,634	100,957	125,528	140,150

The coal raised in 1908 amounted to 13,875,538 metric tons; brown coal, 26,728,926; iron ore, 2,632,407, valued at 22,629,416 kronen; salt, 388,133 tons, 48,403,553 kronen; graphite, 44,

425 tons, 1,725,488 kronen; raw gold, 485,243 kronen. Persons employed, in Austria, in 1907: In mining, 143,490; in smelting, 9112; in salt works, 6947 (6874 in 1908).

In Hungary, the values of the principal mineral and smelting products have been as follows, in thousands of kronen:

	1905	1906	1907	1908
Lignite .....	39,121	46,018	51,887	62,640
Pig iron.....	33,723	33,844	36,329	43,557
Coal .....	11,345	13,178	14,721	16,116
Iron ore .....	8,259	9,276	11,439	13,287
Gold .....	12,017	12,252	11,479	10,787
Silver .....	1,518	1,426	1,266	1,132

Persons employed, in Hungary, in 1908, in mining and smelting, 81,053, and in salt works, 2532.

**MANUFACTURES.** Manufacturing industries have acquired much more importance in Austria than in Hungary. The leading manufactures include cotton textiles, iron and steel goods, sugar, alcohol and spirits, beer, tobacco, woodenwares, paper, earthenwares, glass, and leather goods. The latest comprehensive statistics for Austria are for 1902, when productive industries numbered 652,424 (629,809 principal and 22,615 subsidiary), with 2,869,457 employes and 1,558,582 horsepower; trade and transport, 399,412 industries (370,302 principal and 29,110 subsidiary), with 716,299 employes and 229,285 horsepower; in home industries, 463,564 workers; persons dependent on all these industries, over 7,000,000. For Hungary, the latest comprehensive figures are for 1900, when the workers in the various industries (including trade, etc.) numbered 1,127,730, and the total number dependent thereon, over 2,600,000.

**COMMERCE.** The following table shows, in thousands of kronen, the special trade in merchandise of the common customs territory of the monarchy (imports for consumption and exports of domestic produce) and the imports and exports of coin and bullion:

	1906	1907	1908	1909
<b>Imps.</b>

Values in kronen of the leading imports and exports, in the special trade, in 1908 and 1909 are shown in the table below. The letters at the left indicate: *a* cotton and its manufactures; *b* wool and its manufactures; *c* cereals, flour, etc.; *d* coal and other fuel; *e* vegetables, fruits, etc.; *f* animal products; *g* iron and steel and their manufactures; *h* other common metals and their manufactures; *i* machines, apparatus, etc.; *j* electrical machinery, apparatus, etc.; *k* vehicles and vessels; *l* instruments, watches, etc.; *m* silk and silk goods; *n* flax, hemp, jute, etc., and their manufactures; *o* colonial produce; *p* leather and its manufactures; *q* chemicals, by-products, etc.; *r* minerals; *s* tobacco; *t* rubber and its manufactures; *u* sugar; *v* cattle and draft animals; *w* apparel, etc.; *x* wood and bone manufactures; *y* glass and glassware; *z* paper

and its manufactures; *zz* precious metals (including coin and bullion).

<b>Aus.-H.</b> .....	<b>142,670</b>	<b>16,498,481</b>	<b>141,718</b>	<b>16,277,480</b>

The merchant marine at the beginning of 1909 included 429 steamers, of 447,786 tons, and 14,570 sailing vessels, of 49,328 tons. These figures include 13,077 fishing vessels, of 25,371 tons.

**COMMUNICATIONS.** The total railway mileage at the beginning of 1910 is reported at 27,058, of which 13,849 were in Austria, 12,793 in Hungary, and 416 in Bosnia and Herzegovina. Of the Austrian lines, about seven-tenths, and of the Hungarian about four-fifths, are owned or operated by the state. Austria has about 4200 miles of navigable river and canal, 830 miles being navigable for steamers; Hungary, about 3200 miles, 2450 being navigable for steamers. Post-offices, 1908: Austria, 9706; Hungary, 5773; Bosnia and Herzegovina, 137; foreign, 42. Telegraphs, 1908: Austria, 6698 offices, with 27,570 miles of line and 137,920 of wire; Hungary, 4199 offices, with 16,163 and 89,671;

Bosnia and Herzegovina, 170 offices, with 2033 and 5907. Receipts and expenses of posts and telegraphs, 1908: Austria, 158,354,000 and 160,308,000 kronen respectively; Hungary, 75,208,000 and 58,324,000.

**FINANCE.** The cost of administering the common affairs of the monarchy is borne by both governments in a proportion agreed to by their Parliaments and sanctioned by the sovereign. According to the agreement of 1907, renewed for ten years, the net proceeds of the common customs are applied to the common expenditure, and the remaining expenditure is satisfied by Austria in the proportion of 63.6 per cent. and by Hungary, 36.4 per cent. The monetary standard is gold, and the unit of value the krone (crown), worth 20.3 cents. In 1906 the expenditures of the monarchy amounted to 419,594,656 kronen (339,605,573 ordinary and 79,989,083 extraordinary); in 1907, 433,529,713 kronen (365,582,523 ordinary and 67,947,190 extraordinary). These amounts were balanced by the receipts, which included the net customs revenue of 154,577,783 kronen in 1906 and 162,032,206 kronen in 1907 and the matricular contributions of the two parts of the monarchy totaling 259,706,536 kronen in 1906 and 266,067,557 in 1907. According to the budget for 1910, estimated revenue and expenditure balanced at 432,505,850 kronen. Customs and matricular receipts were estimated together at 423,459,600 kronen. Estimated expenditure for the common army, 344,402,749 kronen; navy 67,097,450.

No loans are contracted jointly by Austria and Hungary. When the union was effected in 1867, existing obligations were assumed in common; this debt on January 1, 1910, amounted to 5,220,443,456 kronen.

The revenue and expenditure of Austria in 1907 were 2,253,052,144 and 2,209,092,911 kronen respectively; in 1908, 2,388,383,708 and 2,373,894,154. For 1910 the estimated gross revenue was 2,727,741,383 kronen, and the estimated total expenditure 2,780,822,657 kronen. The larger items of estimated revenue were: Railways, 776,176,990 kronen; excise, 371,384,000; direct taxes, 348,939,200; tobacco monopoly, 272,147,000; posts and telegraphs, 170,880,000; customs, 155,378,000; court fees, 115,517,200; stamps, 59,255,500; salt monopoly, 48,129,200; lottery, 33,540,150. The larger estimated expenditures (ordinary and extraordinary): Railways, 735,561,850 kronen; ministry of finance, 818,327,143 (including 478,384,244 for public debt); common expense of the monarchy, 350,184,890; posts and telegraphs, 169,503,180; ministry of worship and public instruction, 103,001,572; ministry of public works, 100,458,323; ministry of justice, 86,387,991; ministry of national defense, 98,701,330. On January 1, 1910, the consolidated debt was 5,214,160,023 kronen; floating debt, 310,497,022; total, 5,524,657,045.

In Hungary, the revenue in 1908 was 1,531,368,000 kronen (ordinary, 1,409,321,000); expenditure, 1,616,245,000 kronen (ordinary, 1,319,539,000; sinking fund, 200,390,000). For 1910 the total estimated revenue was 1,555,777,976 kronen (including 161,992,281 extraordinary) and the total estimated expenditure 1,555,729,907 kronen (including sinking fund, 163,063,554). The larger items of estimated ordinary revenue were: Railways, 327,470,000 kronen; excise, 246,835,000; direct taxes, 240,822,000; tobacco monopoly, 144,152,000. The larger estimated expenditures: Ministry of

commerce, 339,167,240 kronen; ministry of finance, 228,047,567; Hungarian debt, 189,823,887; common expense and debt of the monarchy, 147,380,178; national defense, 48,548,723. On January 1, 1910, the debt stood at 4,803,304,000 kronen; in addition, arrears, etc., amounting to 895,112,105 kronen; total, 5,698,416,105.

**ARMY.** The active army of Austria-Hungary consists of a single organization, according to the compromise of 1867. It follows in the main the German model, and in 1910 consisted of 17 army corps. These army corps on a peace footing consisted of 5 cavalry divisions, made up of 252 squadrons, organized as 15 regiments of Dragoons, 11 of Uhlans and 16 of Hussars. There were 34 infantry divisions composed of 468 battalions organized as 106 regiments of the line, 4 of Tyrolese rifles and 26 battalions of regular rifles. By the reorganization of the artillery in 1910 there were 130 field guns and 24 howitzers for each army corps, in addition to 24 guns for the Landwehr division attached to each division of the active army, making in all 178 guns for each corps. The heavy artillery consisted of 5 siege howitzer divisions, each of which on a war footing had 4 gun batteries. There were 12 mountain batteries, and 6 regiments of fortress artillery. In addition to the active army there is in Austria a Landwehr and Landsturm, and in Hungary also a Landwehr and Landsturm which is known as the Honved. This national Hungarian army in time of peace is entirely under Hungarian jurisdiction, but on the outbreak of war is subject to the Commander-in-Chief. Each division of the active army has attached to it a Landwehr division. In the Landwehr there were 37 infantry regiments and 3 localized rifle regiments, and 6 regiments of cavalry, which in 1910 was increased by mounted troops from the Tyrol and Dalmatia. On the peace footing the active army consists of 386,700 men, which in case of war would be augmented to 900,000. The Landwehr and Honved on the peace footing are made up of 67,200 men, and these on the war footing would be increased to 160,000. The second reserve comprises 500,000 men and the Landsturm 2,000,000, so that the Austro-Hungarian army on the peace footing in 1910 amounted to 386,700 men, a number which could be expanded to a war footing of 3,560,000. This last figure was obtained by embodying the class of the Landsturm, but military critics consider that the war effective for Austria-Hungary was about 1,800,000 officers and men.

Army estimates in the budget for 1910 involved a total of 344,935,017 kronen, which included ordinary expenditures amounting to 326,497,077 kronen, extraordinary expenditures amounting to 10,073,500 kronen, and a supplementary expense for the army of occupation of Bosnia and Herzegovina, amounting to 8,364,350 kronen. This budget provided for the army made up of 17,030 officers, 4323 officials, 1042 employes, 2361 cadets and re-engaged non-commissioned officers, 15,264 non-commissioned officers and 271,964 men. In addition the budget included appropriations for 62,209 horses belonging to the monarchy and 10,450 horses for officers.

Military service is compulsory and enforced on all citizens between 19 and 34 years of age in both countries. It consists of service in the common army for 3 years, then 7 years in the reserve, 2 years in the Landwehr reserve and final enrollment in the Landsturm until the period of military service is finished.

The contingent for the year 1910 was fixed as follows: For the common army of the Empire (including the navy) 103,100, of which number 59,024 were recruited in Austria; for the Austrian Landwehr, 19,204. The Hungarian contingent it was claimed during the year would have to be increased as the regiments of infantry were much too weak and various reforms in organization were in progress during the year.

**NAVY.** At the end of 1910, the effective navy included: 8 first-class battleships, of 115,300 tons displacement (*Erzherzog Karl*, *Erzherzog Friedrich*, *Erzherzog Ferdinand Max*, 10,600 each; *Erzherzog Franz Ferdinand*, *Zrinyi*, *Radetzki*, 14,500 each; *Tegethoff*, *Kaiser Franz Josef*, 20,000 each); 3 first-class armored cruisers, of 19,020 tons (*Kaiserin Maria Theresia*, 5270 tons; *Kaiser Karl VI.*, 6250; *Sankt Georg*, 7500); 6 coast-defense vessels, aggregating 41,700 tons; 3 cruisers, aggregating 11,500 tons; 3 small cruisers, aggregating 7050 tons; 14 torpedo-boat destroyers, 5762 tons; 47 torpedo boats, 7155 tons; 12 submarines, 3336 tons. In addition there are transports, gunboats, old vessels, etc., not included in the effective navy.

**GOVERNMENT.** The sovereign of the monarchy in 1910 was Franz Josef I., of the House of Hapsburg, who was born August 18, 1830, and became Emperor of Austria December 2, 1848, and King of Hungary June 8, 1867. His nephew, Franz Ferdinand, born in 1863, is the heir-presumptive. The Emperor-King directs the common administration, under the constitutional compromise of 1867, being assisted by a ministry of three members, for foreign affairs, finance, and war, who are responsible to the two Delegations (of 60 members each), representing respectively the Austrian and Hungarian Parliaments. The Delegations, which convene each year, alternately at Vienna and at Budapest, examine the requirements of the common services and advise the Parliaments as to necessary appropriations. The common government deals with finance relating to the monarchy as a whole, the army and navy, foreign affairs, the diplomatic, postal, and telegraphic services and certain state monopolies. The ministers at the end of 1910 were: Premier and Minister for Foreign Affairs, Count Alois Lexa von Aehrenthal (appointed 1906); Finance, Baron Stephan Burian von Rajecz (1903); War, General Baron Franz von Schönaich (1906); Premier of Austria, Dr. R. Baron von Bienenrath; of Hungary, Count Charles Kuen-Hedervary (appointed January 18, 1910).

Austria and Hungary have each a representative parliament of two houses and a responsible ministry appointed by the sovereign. Croatia and Slavonia and each province of Austria has a separate diet.

#### HISTORY

**RECENT HISTORY.** During the last three years the spectacular events which marked Austria-Hungary's so-called "forward policy" have so absorbed public attention outside the monarchy that comparatively little has been said about the ever present and serious internal problem of the rival nationalities. In 1910 racial antagonisms were conspicuously shown on many occasions and greatly enhanced the difficulty of parliamentary government. The important features of the political situation in 1910 were the embarrassment of the government with its small majority in dealing with the conflicting interests of the nationalities, the pressing need of fiscal reform in view of the rapidly increasing expenses,

and the Hungarian political crisis. As to the "forward policy," it had not caused the predicted disasters. The annexation of Bosnia and Herzegovina, which took place in October, 1908, was followed early in 1909 by a peaceful adjustment with Turkey and, although war with Serbia seemed at one time inevitable, all danger of it was averted when Serbia in March, 1909, finally expressed in the terms demanded by Austria her complete acquiescence. After this threatening crisis, during which Austria made active preparations for war and even mobilized her troops on the frontiers, the fear of any immediate European conflict over the Balkan question subsided. In this imbroglia with Serbia, Russia incurred the bitter criticism of the Slavs by her sudden change of front in what was supposed to be her definite policy in the matter of the annexation. She had from the first steadily favored a European conference on the Treaty of Berlin, but in March, 1909, while the Powers were considering the form of words which Serbia should employ in response to the Austrian demands, Russia suddenly announced her agreement to the Austro-Turkish understanding and her recognition of the annexation of Bosnia and Herzegovina as an accomplished fact, without any reference to the European conference or to international ratification. The Russian Foreign Minister, M. Isvolsky, was sharply criticised and the action of the Russian government was attributed to the fear of war with Germany. In the press generally this sudden and unqualified acceptance of the annexation was regarded as a back-down on the part of Russia and as a triumph for German diplomacy.

In the latter part of 1909 writers on diplomatic affairs were engaged in a controversy as to the real responsibility for the annexation policy. On the one hand it was said that M. Isvolsky had agreed to annexation in advance, having committed himself to it at a meeting with Count von Aehrenthal at Buchlau in September, 1908. On the other hand that interview received widely different interpretations. Charges of bad faith were made by the partisans of both Ministers. Discussion of this subject continued during the opening months of 1910, being of especial interest in connection with the attempt of the Russian and Austrian governments to renew the friendly ties which had been broken by the annexation.

**RELATIONS WITH RUSSIA.** Early in the year negotiations took place between the two chancelleries with the aim of coming to an understanding on the Balkan question. On February 9, 1910, M. Isvolsky announced through his Ambassador at Vienna the Russian government's readiness to exchange views on the subject of the Balkan question, but declared that such an exchange of views ought to take a form that admitted of the participation of all the interested Powers. Therefore the Russian government proposed the following points which should later be brought to the attention of the other Powers: First, maintenance of the *status quo* in the Balkan Peninsula; second, the support and consolidation of the new régime in Turkey; third, the independence, consolidation and peaceful development of the small Balkan states. On February 20, 1910, the Austrian Cabinet replied that there was at present no menace to the *status quo* in the Balkans, that if internal disorders or wars should arise in the Balkan states, such an exchange of views between the two coun-

tries might be useful and that nothing would prevent the subsequent communication of these views to the other Powers in such form as would admit their participation, but "that it is actually at present sufficient to publish the communication in which the two governments declare that the exchange of views has had a favorable result and that the two Cabinets in mutually acknowledging the principles of their policy, have recognized that these principles permit them to enter into relations every time the situation in the Balkans shows them the opportunity." To a later communication from M. Isvolsky saying that it was necessary to invite other Powers to participate in the *pourparlers*, Count von Aehrenthal replied on March 14 that this would lead to the supposition that there was a formal accord between the two governments and that this was not purposed by the Cabinet of Vienna. These communications were published on March 20. The normal relations of amity between the two governments were thenceforth resumed.

**BOSNIA AND HERZEGOVINA.** The constitution of Bosnia and Herzegovina was published on February 21. It provided for universal direct suffrage, but with three classes of electors: First, the larger taxpayers, persons holding academic diplomas, and all members of Chambers of Commerce; second, urban voters; third, country voters. Seats were to be distributed in each class according to the numerical strength of creeds, each creed voting separately. The Crown was to appoint the President of the Diet from among the members of each creed in succession. The Diet was to consist of 72 members and to deal exclusively with the affairs of Bosnia and Herzegovina, including the budget and all matters of administration. During the first week in June the Emperor paid a visit to Bosnia where he received a cordial popular welcome. The Diet of Bosnia and Herzegovina began its first session in the middle of June. Its opening days were marked by a lamentable outrage, an attempt being made to assassinate the local governor as he was returning from the inaugural ceremonies. Criticism of the new constitution began at once in the Diet and soon the three parties united in passing a joint resolution complaining that the constitution did not conform to the wishes of the people and pointing out certain of its defects.

There was some serious criticism in the Delegations of the government's policy toward Russia in the annexation of Bosnia and Herzegovina in October when a young Czech leader accused the government of dragging Austria-Hungary, with its population 60 per cent. Slav, at the heels of Germany and referred to the hostility of the Slavs toward the pro-German Ministry. Count von Aehrenthal replied that this policy had been absolutely necessary and that so far as relations with the foreign countries were concerned, Austria was on friendly terms with Russia, France and England. The government also desired peace and the *status quo* in the Near East, and friendship with Turkey. The majority of the Delegations voted confidence in the government's declaration of its policy and accepted the estimates of the Foreign Office.

**RACIAL CONFLICTS.** The long struggle of the Austrian government to secure a peaceful adjustment between the opposing nationalities continued in 1910. The language question was then as formerly the chief point. The Prime Minister,

von Bienenrath, made repeated attempts to secure a compromise on this subject. He caused conferences to be held and submitted projects of compromise to the discussion of Parliament. He laid down as the programme of the government the securing of a working majority, strong enough to prevent race conflicts from enfeebling the national policy and capable of taking decisive action in foreign affairs. It was implied in the government programme that if a truce could be formed between the warring nationalities the genuine parliamentary government would follow, based on the principle of ministerial responsibility. The principle on which the conciliatory policy of the von Bienenrath Ministry rested was that if German were received as the language of Upper and Lower Austria, the Germans ought to concede something to Bohemia. German and Czech leaders met in conference in the autumn. Negotiations were on the point of breaking off in November but were resumed on the intervention of the Emperor. There seemed little prospect, however, of a compromise, for although the races accepted in principle the need of a *modus vivendi* on the language question, each was unwilling to make any concessions. The Germans demanded the guarantee of their language within its present limits and the Slavs insisted on their historic rights as regards language which would mean an extension of its limits as against their neighbors. The Reichsrath appointed a commission to consider plans of compromise to be referred to it by the government and by Parliament, but the Slavs prevented it from beginning its labors. The question divided the political groups in Parliament and disorganized the national bloc on which the government relied. It could count now on a bare majority of twelve and its supporters were disunited. The Opposition composed of equally heterogeneous material, agreed only on the single principle that if anything went wrong in public affairs the government was to blame for it. Even the Socialists, who controlled over a hundred seats and had been chosen apparently on an international platform, were divided into national groups which were openly hostile to one another. The natural result of these divisions was to prove anew the abnormal character of parliamentary government in Austria. The government was unable to carry out its fiscal reform, and as the session continued racial animosities increased in bitterness. The conferences between the Czech and German leaders, however, were still going on at the close of the year. The Czechs were in a strong position, because the government having lost the support, had to depend on them. See paragraphs below on the *University and Canal Questions*.

**FISCAL POLICY.** The expenses of the government had been mounting rapidly in recent years. The budget for 1910 showed expenditures at 2,780,000,000 crowns and receipts at 2,727,000,000 crowns. During the last two years the public debt had greatly increased, owing to the purchase of railways during that period and to the comparatively small profit which the lines had yielded, but apart from this a great increase of expenditure had taken place in recent years, not only in Austria but in the crownlands, owing to the necessity of duplicating functionaries on account of the polyglot institutions and these expenses were further increased by the confused and cumbersome system of administration involving overlapping of functions as between the state and local authorities. Moreover, new

burdens were imposed on the state by its annexation policy and by the military and naval outlay involved in the attempt to keep pace with the increasing armament of the other Powers. Again, in late years there had been not only a great increase in the number of public servants, including professors and teachers of every class, but also in their salaries. In the several provinces there had been a corresponding increase of expenditure and their budgets had fallen into great confusion. All of them were demanding state aid in the shape of a proportionate share of the revenues from taxation. In the 16 countries of the Crown the deficit had risen to 80,000,000 crowns. They demanded that the administrative system be reformed in such a way as to throw upon the state a part of the cost of maintaining state offices, now borne by the provinces.

The Finance Minister asked Parliament to authorize a loan. After some hesitation this was granted. The discussion on the subject brought out the serious condition of the public finances and the necessity of finding new sources of revenue to meet the increasing deficit instead of having recourse to a temporizing policy of borrowing. The Minister of Finance offered financial projects to this end, but they encountered serious opposition. He proposed a considerable increase in the progressive income tax and in the succession duties, the latter being in accord with the wishes of the Socialist group. The House of Lords in which great landed and industrial interests were represented set themselves against these measures and opposed generally a further levy on large fortunes, favoring rather the imposition of new indirect taxes and the increase of the present ones. The government was unable to carry through its fiscal policy as regards new revenues. Nor did it seem possible to effect reforms by reducing expenses since there was a constant pressure from the different nationalities for new expenditures on their behalf. If for any reason one nationality derived financial benefit from a government measure the others immediately demanded an equivalent, without regard to the difference in the situation, on the principle that all nations should be treated alike. In 1910 the demands of the Italians for a national university and of the Poles for the execution of the canal project promised by the Koerber Ministry in 1901 illustrated the difficulties of the government in dealing with this competitive spirit of the nationalities.

**THE NATIONAL UNIVERSITY QUESTION.** For many years past the Italians have demanded the establishment of an Italian university at Trieste. The government for a long time turned a deaf ear to these demands owing to the relatively small number of the Italians and to the fact that each of the Slav nationalities was also demanding national universities. And although Trieste was an Italian city, its hinterland was wholly Slovenian. Moreover Trieste was a centre of irredentism. Finally, however, the government yielded so far as to establish a Faculty of Law at Wilten, a suburb of Innsbrück, where a building was placed at their disposal, but the Germans of the Tyrol protested against it and hardly had it begun its work when an attack was made on the building, and the students were driven out and the furniture was destroyed. After this outbreak the government made no further attempt to maintain a university there. It was then proposed that it should be set up in an Italian community and the gov-

ernment named the little town of Rovereto, but the Italians opposed this and insisted on Trieste. The government declared that it was bound by its promise but the question of a site still remained unsettled. As soon as the Italians brought pressure to bear on the government to redeem its promise each of the Slav nationalities renewed their demand for a national university. The Czechs, though they have a university at Prague, demanded another one at Brinn. The Ruthenians demanded a university of their own, but were divided among themselves as to its proper site. The Slovenians demanded a university at Laibach and the Rumanians asked that the University of Czarnowitz be turned into a Rumanian institution.

Obviously the government could not meet all these demands, which not only would entail great additional cost on the already heavily burdened finances, but would result in the foundation of skeleton universities with insufficient funds for their maintenance and likely to become centres of nationalistic agitation. A student outbreak at Lemberg at the end of June illustrated the bitter racial rivalries in this matter. During the discussion of the budget the Greek Orthodox Archbishop of Lemberg made a speech on June 29 in favor of a Ruthenian university in that city, whereupon the Polish students at the University of Lemberg made a violent demonstration on behalf of the establishment of a Polish university there and a fracas took place in which several persons were injured. These conflicts on the university question made compromise on the issues between the nationalities impossible. The government managed to hold together its majority against the Slavic opposition by the aid of the Poles, but after the budget vote a crisis arose owing to the government's refusal of their demand that a law for the construction of canals uniting the Danube with the Vistula be immediately voted.

**THE CANAL QUESTION.** When the Koerber Ministry in 1901 promised the construction of these canals one of the chief arguments on behalf of the project was the necessity of a competing route as against the Northern Railway system, but since that time the Northern Railway system has been purchased by the state. Moreover, the early estimates of cost of the canals had been hastily prepared and were found to be hardly more than a third of the probable cost. On the other hand the Poles declared that the law for the construction of these canals had been voted and ratified and that it must be put into execution. The price of estates in the neighborhood of the proposed canals had increased and there would be serious losses to investors. The future development of Galicia depended on the execution of the project. The Northern Railway system would not suffice for the increasing traffic, especially since the discovery of rich coal fields, for whose exploitation additional means of transportation were necessary. The threat of Polish defection prevented the government from carrying out its fiscal reform projects, and the opposition of the Slavs to an Italian university made it impossible for the government to keep its promise to the Italians in that matter. National jealousies on these subjects and others increased and a serious crisis was averted only by the adjournment of Parliament. On the next meeting of Parliament, the opposition of the Poles continuing, the Cabinet resigned without taking a vote. The anger of the Poles was intensified by the fact

that the Minister of Finance, himself a Pole, opposed their demand.

**HUNGARIAN POLITICS.** The prolonged political crisis of 1909 came to an end on January 4, with the definite appointment of Dr. de Lukacs as Premier. He resigned, however, on January 11, and was succeeded by Count Khuen-Hedervary, to whom Count Tisza and the remaining members of the Liberal party pledged their support. De Lukacs was appointed Minister of Finance in the new Cabinet. Its chief aim was to secure a majority in the coming elections. Its programme comprised a conciliatory policy toward Austria and Croatia, universal suffrage, the reform of the county administration, and the transfer of the appointment of county officers from the locality to the state. The Chamber at first showed itself hostile to the new Ministry, treating it with noisy demonstrations and characterizing its members as lackeys of the Imperial government. Soon after its opening in January the Ministry brought in various measures for the carrying out of its policy and it declared that it would judge from the treatment of these measures whether peace between the government and the legislature was possible. It aimed at reform of the suffrage without plural voting and promised a settlement of the Croatian question. The majority in the Chamber consisted of the Kossuth, Justh and Clerical parties. The followers of Andrássy were neutral. Failing to make progress against the Opposition the government dissolved Parliament on March 22, after appealing to the country to form a new party, to be known as the party of National Labor, in support of its programme. Riotous outbreaks in the Chamber took place on the announcement of dissolution. The elections of May went completely in favor of the government, supporting Hedervary, who was the government's spokesman. The government secured 246 seats out of 413. Thus the adroitness of the King in dealing with the situation was again demonstrated. For a long time there had seemed to be a danger that the Independence party, which was working for the separation of the dual monarchy, would gain its end. Its following increased and finally it received a majority in the elections. Hereupon the government, instead of fighting the Opposition, formed a new Ministry from its members, a policy which seemed at first thought dangerous, as playing into the hands of its enemies by admitting into power the propagandists of separation, including Francis Kossuth, the son of the great revolutionary leader. But, as happens often with radical parties when in power, temporizing counsels and compromises divided the Independence party into two wings, one element favoring a conservative course now that it was in possession of the government, and the other insisting on a radical programme including an independent bank, the nationalization of the Hungarian army and other measures tending to loosen the imperial bonds. This division resulted in the complete triumph of Count Hedervary, who secured a majority of 160 seats, and for the first time in a long period the Emperor-King had a Ministry upon whom he could absolutely rely. In the new Chamber which was opened on June 25 there were 246 Ministerialists, 48 Kossuth Independents and 37 Justh Independents. The strength of the new government in Hungary was assured in July when the acceptance of the address of the government was carried by a large majority. The Premier's

speech was applauded for its moderation and wisdom, even by the members of the Opposition and by the Opposition press. He urged the need of a common army and a common bank.

**THE HUNGARIAN LOAN.** Hungary endeavored to negotiate a loan of 560,000,000 kronen in the French market, but French financiers, though at first apparently ready to accept the loan, developed a reluctance in the matter which was attributed to Russia's supposed intention to issue a new loan in Paris, and to the Austrian government's failure to comply with the demand for the redemption of the Austrian Southern Railway bonds, which are largely held in France; also to the measures taken in Austria against a certain loan the suspicion having arisen and being company in which the French held securities. Political reasons were also urged against the heightened by disclosures in Austrian journals, that the placing of the Hungarian loan in Paris was acceptable to the Austrian government, as the Austrian government could then more readily supply the government's needs, which were heavy on account of the shipbuilding programme. After failing to place the loan in Paris the government began negotiations for placing the loan in Austria and Germany and in the autumn these negotiations were practically complete.

**OTHER EVENTS.** At the beginning of April the Croatian Supreme Court annulled the sentences imposed on the 31 defendants convicted in 1909 at the Agram high treason trial. This trial had arisen from charges that were brought against 53 persons in 1909 in connection with an alleged conspiracy for the separation of the provinces of Croatia, Slavonia and Bosnia from the empire to form a part of a "Greater Serbia." Twenty-two of the prisoners were acquitted and thirty-one were condemned to terms of penal servitude, but the penalty had fallen far short of the demands of the prosecution, which had insisted on a death sentence in five cases and 20 years of penal servitude in others. The government had been sharply criticised for accepting trivial evidence in support of such serious charges. There were sharp differences in the course of the year between the Ban of Croatia and the Diet, a coalition of Serbs and Croats having demanded the dismissal of two judicial officers. This the Ban, Baron Rauch, refused and, the opposition continuing, he resigned, but the King refused to accept his resignation.

**AUSTRIAN ARCHITECTURE.** See ARCHITECTURE.

**AUSTRIAN MUSIC.** See MUSIC.

**AUTOMOBILE FIRE APPARATUS.** See under FIRE PROTECTION.

**AUTOMOBILES.** The increase in the use and manufacture of automobiles which has marked the years since the practical perfection of the use of these vehicles continued during 1910, and the year was the most prosperous in the history of the industry. It is impossible to obtain exact figures, but estimates show that the output of the United States alone was over 200,000 cars, including both pleasure and commercial cars, and the value of these cars reached more than \$300,000,000. It was estimated that over 400,000 cars were in use in the United States in 1910. A corporation was formed in New York City, in November, with a capitalization of over \$16,000,000, which took over the control of eight or ten large subsidiary companies. This followed the formation in 1909 of a similar corporation capitalized at \$60,000,000,

controlling more than thirty subsidiary companies.

**NEW MODELS.** Many manufacturers of larger cars displayed in 1910 smaller and cheaper models as the demand for this grade of cars has shown a notable increase. The demand for smaller cars is especially felt from farmers and from physicians in the rural regions. The models of 1911 show changes chiefly in the body lines and the general adaptation of the torpedo fore-door design. About the same number of models as in 1910 related to the 4-cylinder engine with somewhat longer stroke than the 6-cylinder, but there were fewer 2-cylinder cars.

The tendency toward standardization of parts continued and this resulted in the production of a lower-priced car.

**COMMERCIAL VEHICLES.** This branch of the automobile industry continued during 1910 to assume increasing importance. Large motor trucks took the place of horse-drawn vehicles to a greater extent than ever before, and great improvement was made in the construction of large motor trucks. Motor cars were more popular than ever before in the larger cities.

**LEGISLATION.** The most drastic law passed during the year was the so-called Callan Law in New York. This provided for legislative numbering and regulation of motor vehicles and licensing and regulation of chauffeurs. Every owner of a vehicle must file with the Secretary of State a verified application for registration containing a brief description of the vehicle to be registered, giving the name of the manufacturer and factory, number, character and amount of motor power and figures of horse-power according to the rating of the Association of Licensed Automobile Manufacturers, together with the name and residence of owner. No person shall operate or drive a motor vehicle who is under 18 years of age unless accompanied by a duly licensed chauffeur or the owner of the vehicle. The fee for a motor vehicle having a rating of 25-horse power or less is \$5; for one of 25 and less than 35-horse power, \$10; for one of more than 35 and less than 50, \$15; for one of 50 or more, \$25. Each motor vehicle shall have a distinctive number plate corresponding to the registration number assigned by the Secretary of State on the front and rear of such motor vehicles. Every person operating a motor vehicle on the public highway of the State is required to drive it in a careful and prudent manner and at a rate of speed that will not endanger the property of another or the life and limb of any person. The rate must not exceed 35 miles an hour. Legislation relating to automobiles was also enacted by the legislatures of Kentucky, Massachusetts, New Jersey, Virginia and Maryland. The last named State added twenty-one new sections to its automobile law. The Kentucky law prescribed fees, as did the Virginia law. For mention of these enactments, see section *Legislation* under each of the States.

**SELDEN PATENT.** In 1909 Justice Hough in the United States Court at New York handed down a decision on the Selden claim of a basic patent on gasoline automobiles. He sustained the patent, holding it to be valid and infringed by those who illegally used it. This patent was filed by George B. Selden of Rochester, N. Y., in 1879, as application for a patent on a road locomotive of a design substantially the same as that of the present day automobile. The

patent lay in the Patent Office for more than sixteen years or until 1895, during which period various American and European constructors had developed and were marketing actual cars, apparently with no knowledge of the Selden patents, but along lines generally agreeing with the description of his claim. Selden instituted suit for infringement against various firms and individuals building, selling or using the machines alleged to infringe. A number of the original manufacturing firms had conceded the validity of the patent and had formed an organization known as the Association of Licensed Automobile Manufacturers. The result of this decision was the practical elimination of independent automobile manufacturers. Most of these at once joined the Licensed Association and were then under obligations to pay royalties. This patent expires in 1912, after which date any manufacturer will be free to use the Selden designs.

**EXHIBITIONS.** The Tenth International Automobile Show opened January 1, 1910, under the auspices of the American Motor Car Manufacturers' Association. This was an association of independent manufacturers and later disbanded (see above). The Tenth Automobile Show of the Association of Licensed Automobile Manufacturers was held at Madison Square Garden, New York, January 8-15, 1910. Nearly all the important manufacturers in the Association exhibited cars, which included gasoline, electric and steam cars, pleasure and commercial vehicles, fire wagons, motor cycles, parts and accessories.

**EXPORTS AND IMPORTS.** The figures of export and import of automobiles in recent years show the steadily increasing popularity of American made cars. In 1908, 1045 cars were imported, valued at \$2,500,134; in 1909, 1624 cars, valued at \$2,905,391, were imported; and in the fiscal year 1910 1473 cars, valued at \$2,851,446 were imported. The exports of automobiles for the three years, with their value, was as follows: 1908, 2477, \$4,656,991; 1909, 3184, \$5,387,021; 1910, 6926, \$9,548,700.

**RACING EVENTS.** The principal racing events of 1910 were the Vanderbilt Cup Race, on Long Island, the Grand Prize Race, at Savannah, the National races at Elgin, Illinois, the Fairmount Park tournament at Philadelphia, the Los Angeles-Phoenix and the Santa Monica contests. The annual 24-hour races at Brighton Beach also attracted considerable attention. Never in the history of the sport were so many records broken as in the past year. New figures were made on the circular track for every distance between one mile and 75 miles, and all the speedway records from a half mile to 250 miles also fell. Barney Oldfield and Ralph de Palma were the drivers primarily responsible for this excellent showing, although praise is due also to George Robertson, Louis Chevrolet and Ray Harroun.

The Vanderbilt Cup Race was won by Harry Grant for the second year in succession. He drove an Alco car 278.08 miles in 4 hours, 15 minutes and 58 seconds. Joe Dawson in a Marmon finished second and Jack Aitken in a National third. So many accidents occurred during the running of the race that the Grand Prize struggle was transferred to Savannah. Here David Bruce-Brown, an amateur driver, astonished the experts by coming out a victor. In a Benz car he covered the 415.2 miles at an average rate of 70.55 miles an hour, establishing a new record for the international free-for-all

event. The Elgin National went to Ralph Mulford, who in a Lozier drove 305 miles, 204 feet, in 4 hours, 52 minutes, 30 seconds, an hourly average of 62.5 miles. Mulford also came near to winning the Fairmount Park races, being defeated by Zengle in a Chadwick. Zengle's time for 202.5 miles was 3 hours, 29 minutes, 7 seconds. Harvey Herrick won the race from Los Angeles to Phoenix, Ariz., a distance of 405 miles. His time in a Kissel car was 15 hours, 44 minutes. In the Santa Monica free-for-all "Teddy" Tetzlar was the victor. He also won the stripped stock chassis. His average rate per mile in the first event was 71.46 miles an hour, and in the second, 73.24 miles.

The most important of the new records established during the year follow: Speedway—1 kilometre, Oldfield in a Benz, 21.45 seconds; 1 mile, same driver, 35.63 seconds; 5 miles, de Palma in a Fiat, 3 minutes, 15.62 seconds; 10 miles, Robertson in a Simplex, 6 minutes, 35.62 seconds; 20 miles, Hearne in a Benz, 14 minutes, 6.42 seconds; 25 miles, de Palma in a Fiat, 18 minutes, 52 seconds; 50 miles, same driver, 37 minutes, 55.53 seconds; 75 miles, Harroun in a Marmon, 57 minutes, 15.79 seconds; 100 miles, same driver, 1 hour, 16 minutes, 21.9 seconds; 150 miles, Dawson in a Marmon, 2 hours, 1 minute, 9.43 seconds; 200 miles, same driver, 2 hours, 43 minutes, 20.14 seconds; 250 miles, Horan in a Lozier, 3 hours, 26 minutes, 15 seconds. Straightaway—1 mile, Oldfield in a Benz, 27.33 seconds; 2 miles, same driver, 55.87 seconds; 200 miles, de Hymel, in a Stoddard-Dayton, 3 hours, 2 minutes, 22 seconds. Circular track—1 mile, de Palma in a Fiat, 48.92 seconds; 5 miles, same driver, 4 minutes, 11.9 seconds; 10 miles, same driver, 8 minutes, 31.2 seconds; 20 miles, Oldfield in a Darracq, 18 minutes, 15 seconds; 25 miles, same driver, 22 minutes, 47 seconds.

**EVERY, SAMUEL.** See NEBRASKA, UNIVERSITY OF.

**AVIATION.** See AERONAUTICS.

**AWDEY, WILLIAM.** A bishop of the Anglican Church, died January 4, 1910. He was born in 1842 and was educated at Winchester and at Balliol College, Oxford, graduating from the latter institution in 1865. In 1867 he was ordained priest and undertook a curacy at the Church of St. Peter-in-the-East. In 1868 he was appointed Second Master at Winchester School. From 1873 to 1879 he was Head Master of St. John's College, and he succeeded Bishop Durnford as principal of the college at Chichester and Canon of the Cathedral. This position he held until 1886, when he became vicar of Amport, Hants, where he remained until 1896. In 1895 he was appointed as additional suffragan for the diocese of Winchester. He had long desired missionary service and in 1896 he accepted a call to be the first bishop appointed to the missionary diocese of Osaka. In 1898 he was translated to the diocese of South Tokio. He was a strong force in the life of the Church of Japan.

**BAHAMAS.** A group of 20 inhabited islands and numerous uninhabited isles, islets, and rocks, lying southeast of Florida and constituting a British colony. Area, 5450 square miles; population (1901), 53,735; estimated (1908), 60,283. Nassau, the capital, is on New Providence Island, which has 12,534 inhabitants. There are government and mission schools, with a total enrollment (1908) of 9498 pupils; and 4 private secondary schools, with 154 pupils. There are sponge and turtle fisheries; shells, pearls and ambergris are produced; pineapples, oranges and tomatoes are raised for export. The area under sisal fibre plants in 1908 was 25,000 acres. Canning and sisal factories and lumber mills furnish occupation for a number of the natives. imports (1909), £373,489; exports, £171,442; tonnage entered and cleared, 1,304,651; revenue, £77,578; expenditure, £92,858; public debt, £59,447. Governor (1910), Sir William Grey Wilson.

**BALAKIREFF, MILI ALEXEYEVICH.** A Russian composer and founder of the Young Russian School of Music, died June, 1910. He was born in 1837 in Nizhni-Novgorod. He showed exceptional musical ability when still a youth and studied in his native city. At the age of eighteen he knew nearly all the classics of music by heart. In 1865 he graduated from the mathematical department at the University of Kazan and went to St. Petersburg, where he was befriended by the famous musician, Glinka. He made a brilliant debut as a pianist, but gave up that career. He gathered about him several youthful enthusiasts, who were all striving for nationalism in music, and laid the foundation of the modern Russian School. Under the energetic guidance of Balakireff, they studied all the masters of music from the earliest times. He possessed a striking power of analysis as well as of imparting knowledge and he taught his pupils whatever he learned himself. They first embodied their theories in literary articles and then in musical compositions. Balakireff's own contributions to this movement were: *Songs* (1858-60); three overtures, on Russian themes (1858), on Czech themes (1867), and the Millennium (1862); incidental music to *Lear* (1858-61), a collection of 40 *National Songs* (1866), and a piano fantasy, *Islamey* (1869). Jointly with Lomakin, he founded in 1861 the free musical school, and in its classes the works of the Young Russian School were performed under his direction. In 1861 he gained a European reputation by his production and conducting of Glinka's *Ruslan and Ludmilla*. On his return he was elected conductor of the Russian Musical Society, but resigned on account of intrigues in 1869. In 1872 he withdrew from public life owing to ill health. From 1883 to 1894 he was director of the Imperial Capella, which he placed on a solid musical foundation by organizing classes in various branches of musical instruction. His fantasy for orchestra, *Tamara* (1867-1882) and his symphony in C major (1898) are his greatest works. Though not prolific, he occupied in the history of Russian music one of the most distinguished places.

**BANKS AND BANKING.** This article contains a statement of the general banking conditions and developments of the year, treating such phases as relate to this subject as a whole. Elsewhere will be found articles on the different kinds of banks—national, State, savings, postal-savings, and loan and trust companies—as well as articles on CURRENCY, CENTRAL BANK, MONETARY COMMISSION, and FINANCIAL REVIEW.

In banking as in business, the year was one of caution, of preparation for an expected calamity which never came. This meant extensive liquidation and, at times, a contraction of loans. The severe lessons of the 1907 panic, and the belief that the business expansion in 1909 was too rapid caused hesitancy in the extension of credits. Although the volume of loans and discounts established a new record taking the country as a whole, the New York banks were considerably below their high mark of 1909. This was due to shrinkage of stock exchange dealings. This in turn was in part due to the generally high rate of interest. This was a feature in all sections of the country. The money market however suffered from no serious disturbances, and, after the great demands for crop movement in the fall had been successfully met, money became easier at the close of the year. On the whole, in spite of more than normal uneasiness, the high interest rates made it a profitable year in banking, dividends being maintained or increased.

**RESOURCES AND LIABILITIES.** The aggregate resources of the 23,095 banks reporting June 30 to the Comptroller of the Currency were \$22,450,000,000. Some State and many private banks did not report. Of this aggregate, \$12,553,695,000 represented the total resources of the 15,950 banks other than national. The resources of all banks included: loans and discounts, \$11,373,000,000; bonds and securities, \$4,614,000,000; cash, \$1,452,000,000. The 7145 national banks were credited with 43.6 per cent. of the loans and discounts of all banks, with 34.3 per cent. of the bonds and securi-

ties and with 61 per cent. of the cash. The aggregate resources were \$1,355,000,000 greater than those reported by 22,491 banks to the National Monetary Commission in 1909. They were three billions greater than the aggregate in 1908; and more than double those of 1900, when 10,382 banks reported total assets of \$10,785,000,000.

Set over against these enormous resources were the liabilities, including: capital, \$1,880,000,000; surplus and undivided profits, \$1,952,600,000; and individual deposits, \$15,283,400,000. National banks were charged with 55 per cent. of the capital, 44 per cent. of the surplus, etc., and 35 per cent. of the deposits.

The resources of the 15,950 State, private, and other banks were divided as follows: 12,166 State banks, aggregate resources, \$3,694,958,000; 638 mutual savings banks, \$3,652,449,000; 1121 stock savings banks, \$829,422,000; 934 private banks, \$160,015,000; 1091 loan and trust companies, \$4,216,850,000. These banks collectively held \$9,996,000,000 of individual deposits. Of this 30 per cent. was held by loan and trust companies; 34 per cent. by mutual savings banks; and 27 per cent. by State banks. Taken together the resources of these banks increased by 115 per cent. during the decade, being \$5,841,658,000 in 1900. In this period their capital increased 121 per cent.; their loans, 134 per cent.; bonds and other securities, 80 per cent.; deposits, 109 per cent.; cash, 153 per cent. From these data it appears that these banks increased in resources very nearly as rapidly, on a percentage basis, as national banks, in spite of the enormous growth of the latter following the act of 1900. Comparisons of the relative growth of these various banks will be found in one of the reports of the National Monetary Commission issued during the year.

**DEPOSITS AND DEPOSITORS.** In their reports of June 30, 19,194 banks gave the number of their depositors. The total was 27,977,817, of whom 16,650,935 were classed as savings depositors. The savings depositors were distributed as follows: national banks, 2,339,354; State, 2,816,561; mutual savings, 7,481,649; stock savings, 1,661,259 (includes 359,605 depositors other than savings); private, 91,844; loan and trust companies, 2,260,268. Savings deposits aggregated \$5,440,685,000, of which only 10 per cent. was in national banks, and 75 per cent. in savings banks. Other depositors were distributed in the following manner: national banks, 5,349,389; State, 4,442,572; private, 223,020; loan and trust companies, 1,311,901. The total, \$15,283,400,000, deposits in all banks were distributed in the following proportions: national banks, 34.6 per cent.; State, 17.9; savings, 26.6; private, .8; loan and trust companies, 20.1. Compared with 1900 the proportion of deposits in savings banks declined nearly 7 per cent. while that in loan and trust companies increased nearly 6 per cent. By groups of States the percentage distribution of deposits was: New England, 14.5; Eastern, 42.7; Southern, 7.4; Middle Western, 23.3; Western, 5.1; Pacific, 6.8; Islands, .2.

**BANKING POWER.** The banking power of the United States, based on the capital, surplus and undivided profits, deposits and circulation of the 23,095 reporting banks and 4168 non-reporting banks (returns estimated) aggregated \$21,049,000,000. This included: capital, \$1,957,000,000; surplus, etc., \$1,980,800,300; deposits,

\$15,859,600,000; circulation, \$675,600,000. The total banking power thus computed was \$2,200,000,000 greater than a similar computation for 1909; and \$3,400,000,000 greater than for 1908. The aggregate for the world, exclusive of the United States in 1908, was \$28,107,000,000.

**GUARANTY OF DEPOSITS.** During the year suits were brought in Kansas, Oklahoma, and Nebraska to test the constitutionality of the laws guaranteeing deposits in State banks. The laws of Nebraska and Oklahoma are compulsory on all State banks, while that of Kansas is optional. In all cases the chief plea against the law was that it violated the provisions of the Fourteenth Amendment. The case to test the Kansas law was brought by certain national banks of the State against the State bank commissioner and the State treasurer. The Circuit Court of Appeals, on May 20, refused an injunction restraining these officers from carrying out the deposit guaranty act. The Court held that the exclusion of national banks from the operation of the law was not special legislation of a sort legally objectionable; that the Fourteenth Amendment, guaranteeing the equal protection of the laws, is not thus violated, for this "merely requires that all persons subjected to such legislation shall be treated alike under like circumstances and conditions." It was argued against the law that it impaired the efficiency of national banks as instrumentalities of the national government by attracting depositors to the guaranteed State banks. The Court denied this contention on the ground that, were it true, then every measure designed to improve State banks would be invalid. The Court held that the law could only affect national banks indirectly and incidentally, if at all; that there was no effect of which the Court could take cognizance. No judgment was passed upon the merits of the guaranty plan. In the cases of the other laws the courts had held these to be legal on the ground that they were designed to increase the safety of the banking system, and to reduce the probabilities of banking panics. All of these cases were to be decided by the United States Supreme Court early in January, 1911.

**COTTON BILLS OF LADING.** As a result of losses of several million dollars due to fictitious bills, a resolution was adopted by London bankers late in July to the effect that, after October 31, American cotton bills of lading would not be accepted unless guaranteed by American bankers. The irregularities complained of were discovered in April and the action of the London bankers was based upon the report of a committee appointed to investigate. This announcement caused considerable concern among cotton shippers and banks handling their business. These bankers proposed to the European bankers that bills of lading validated by railways be accepted, such validation to be performed by a railway official other than the agent signing the bill of lading. This proposition was refused on the ground that it did not provide sufficient protection against spurious bills. A committee of American bankers announced their belief that any additional guaranty on their part would violate sound banking principles, as well as be illegal under the national banking act. They especially emphasized the fact that to require such guaranty for American bills, when it is not required for those of

any other country, would seriously discredit American bills. The foreign bankers then sent a special representative to New York to urge a plan of insuring cotton bills of lading by some surety company, at a probable cost of 5 or 6 cents per bale. This was rejected by bankers and merchants alike as discrimination against the cotton export trade and as a premium on rascality. European bankers later extended the time allowed for the provision of some means of guaranteeing the soundness of cotton bills to December 31, and very early in December withdrew the peremptory character of their demand. The final settlement of the matter, however, was not reached. Meanwhile late in November indictments had been brought against certain merchants who were responsible for the fraudulent bills; and the Interstate Commerce Commission had ordered railways to exercise greater care in the use of bills of lading and not to issue them until goods were in their possession. In view of this trouble President Taft in his message to Congress urged legislation authorizing railways to issue a bill of lading which they would guarantee.

**LEGISLATION.** The most notable piece of banking legislation passed during the year was that providing for a system of postal savings banks (q. v.). Though such banks had long been advocated by certain reformers and social workers, they did not become an imminent probability until the panic of 1907, with its collapse of confidence in many great banking institutions, showed the necessity of depositaries in which public confidence could not be shaken. The great foreign population and their familiarity with such banks in their native lands constituted another principal factor.

At the insistence of the New York Immigration Commission, the private banking law of that State was amended by requiring the licensing of all persons or firms receiving money for deposit or for transmission to foreign countries. The law requires the deposit of \$10,000 and a sufficient surety bond with the State Comptroller and public reports and inspection. Money received for transmission abroad must be sent within five days. Hotel keepers, telegraph companies, express companies, and private bankers who do a business of less than \$500 annually or file bonds for \$50,000 (\$100,000 in New York City), are exempted. The object of the law is to put a stop to the fleecing of aliens by private persons or firms posing as bankers.

A somewhat similar law in New Jersey was amended by requiring a bond of \$20,000 with satisfactory sureties from all agencies engaged in transmitting money to foreign countries. The State also authorized minors to become bank depositors, with all rights and liabilities of adult depositors.

In Massachusetts, owing to the looting of a couple of important savings banks in the past two years, a law was passed authorizing the bank commissioner to take possession of a savings bank or trust company whose stability has been impaired, charter violated, or business conducted in an unsafe manner. The commissioner is to act as a receiver, retaining control until the bank is rehabilitated or its affairs closed. Another Massachusetts act gives the bank commissioner discretionary authority over the appraisal of real estate and loans thereon, when too great loans seem to have been made. It also permits the scaling down of all accounts

by the Supreme Court when a savings bank has made unfortunate investments. This State also forbade extraordinary alterations in savings bank buildings in excess of \$10,000 cost without approval of the bank commissioner.

Kentucky authorized the formation of companies to do loan and trust, banking, and real estate title insurance business. Maryland thoroughly revised its banking laws. Ohio made the publication, orally or in writing, of statements derogatory to a bank a criminal offense. Ohio also authorized that deposits, made in the name of two persons and payable to either or survivor, may be paid to either, whether the other is living or not.

**BANKS, A. BLEECKER.** An American public official and publisher, died August 7, 1910. He was born in New York City in 1837, but when a young man removed to Albany, where he engaged in the law book publishing business, which had been established by his father, David Banks. He subsequently became the head of this firm. He was chosen Mayor of Albany for 1876-7 and for 1884-5. While Mayor he inaugurated the use of the granite block pavement in Albany and improved the sewer system. He was State Senator in 1868-71 and was a member of the Assembly from Albany County in 1862. In 1884 he was a delegate to the Democratic National Convention and assisted in the nomination of Grover Cleveland.

**BAPTISTS.** A religious denomination which was given its name in 1644 from the designation applied to certain congregations of English Separatists, by whom the ancient practice of immersion had been recently restored. The denomination was founded in the United States by Roger Williams, who established the first congregation at Providence, R. I., about the middle of the seventeenth century. There are in the United States fourteen bodies to which the name Baptist is applied in one form or another. By far the greater membership, however, is included in the regular Baptists. This main body includes the Northern Baptist Convention, the Southern Baptist Convention and the National Baptist Convention, Colored. The number of communicants in these three divisions of the larger body was in 1910 as follows: Northern Convention, 1,176,380; Southern Convention, 2,139,080; National Baptist Convention, Colored, 1,874,261. The designation and membership of the other divisions bearing the name are as follows: General Six Principle Baptists, 731 communicants, 16 churches and 10 ministers; Seventh Day Baptists, 8239 communicants, 82 churches and 96 ministers; Free Baptists, 73,536 communicants, 1303 churches and 1294 ministers; Free Will Baptists, 40,578 communicants, 623 churches and 604 ministers; General Baptists, 32,500 communicants, 538 churches and 550 ministers; Separate Baptists, 5180 communicants, 76 churches and 100 ministers; United Baptists, 13,698 communicants, 196 churches and 260 ministers; the Baptist Church of Christ, 6416 communicants, 93 churches and 99 ministers; Primitive Baptists, 102,311 communicants, 2922 churches and 1500 ministers; Primitive Colored Baptists, 35,076 communicants, 797 churches and 1480 ministers; Two-Seed-in-the-Spirit Predestinarian Baptists, 781 communicants, 55 churches and 35 ministers; Church of God and Saints of Christ, 2823 communicants, 48 churches and 75 ministers. The total

number of Baptists in the United States in 1910 was 5,510,590. These statistics of membership are those prepared by Dr. H. K. Carroll for the *Christian Advocate*, published in 1910. The *American Baptist Year Book* gives the total number of Baptist communicants as 5,266,369 with 33,909 ordained ministers and 49,035 churches.

The religious census taken by the United States Census Bureau in 1906 and published in 1909-10 gives as the total number of communicants in all Baptist bodies in 1906, 5,662,234 as compared with 3,712,468 in 1890, an increase from 1890 to 1906 of 1,949,766 or 52.5 per cent. In the main bodies in that year there were 47,910 organizations. At the beginning of 1909 the Sunday schools in the denomination numbered 33,633, with 2,498,354 scholars and 248,836 officers and teachers. The value of the church property was \$133,528,647. The denomination contributed for foreign missions, \$981,332; for home missions, \$820,735; for education, \$329,673; and for miscellaneous expenses, \$1,470,916. The total contributions for the support of the work of the denomination during 1909 were \$24,122,911. The denomination supports missions in Burma, Assam, South India, China, Japan, Africa, Philippine Islands and in Europe. Home missions are carried on in different parts of the United States and the total number of missionaries supported wholly or in part by the Home Missionary Society was, in 1909, 1560. The Southern Baptist Convention, which is an organization of the Southern Baptists, maintains missions in South America, Italy, Africa, China and Japan. Among other organizations, whose titles sufficiently indicate their purposes, are the American Baptist Publication Society, the American Baptist Home Missionary Society, and the Women's Baptist Foreign Missionary Society. The German Baptist Conference has general charge of work among the Germans and the Swedish Baptist Conference has charge of the work among the Swedes of the Northwest. The church maintains ten theological seminaries, with a total membership in 1909 of 1349. The endowment of these institutions amounted to \$4,110,500. There are 86 universities and colleges under the denominational control in the United States. These had in 1909 32,495 students and an endowment of \$30,099,419. In addition to this there are 79 academies, seminaries, institutes and training schools. The denomination maintains many charitable institutions in different parts of the country.

According to the *American Baptist Year Book* for 1910, the total number of Baptists in the world in 1910 was 6,240,272. The figures for the United States are given above. There were in Europe 588,727 communicants; in Asia, 150,424; in Australasia, 27,195; in Africa, 16,298, and in South America, 6094.

The meeting of the Northern Baptist Convention in Chicago May 3-10, 1910, was one of the most successful and significant meetings of the denomination in recent years. Of particular importance was the establishment of the relations of the Convention with the national missionary societies, and the reports of various commissions on educational, social and religious work. The attendance at the Convention was very large. More than 3000 delegates and visitors were registered. Of these over 2300 were

regularly enrolled delegates. A movement has been on foot for several years for a union with the regular Baptists of several other branches of the denomination, particularly of the Free Baptists. This union is designed to include chiefly the missionary work of the two organizations. Definite action was taken in 1910.

**BAPTISTS, FREE**, sometimes called **FREE WILL BAPTISTS**. A religious denomination founded in 1780 by Benjamin Randall, who established a church at Durham, N. H., after he had left the regular Baptist denomination because of his disbelief in the doctrine of election. The denomination is strongest in New England, but has a considerable strength in the West. According to a religious census made by the United States government in 1906, and published in 1910, the total number of communicants was 81,359, 1111 church edifices and 1160 ministers. The membership had not changed materially in 1910. The Free Baptists do not carry on any philanthropic enterprises distinctively denominational in character. They are, however, increasingly interested in matters pertaining to the general welfare of communicants and are sharing more closely in the interdenominational work of the churches. Foreign missions are carried on through the Foreign Missionary Society and home missions through the Home Missionary Society. The General Conference, held in July at Old Orchard, Me., adopted the basis of union or coöperation in missionary work with the Baptists which the Northern Convention had previously adopted in May. The basis of coöperation was planned to go into effect in 1911. It means ultimate organic union. This movement has suffered no check since its beginning six years previous. During this time the denomination has not suffered appreciably, but has sustained its missions at home and abroad, its educational and publication institutions. The membership of the denomination, however, has not increased, owing to the fact of its being in the country. The denomination maintains several colleges, among them Bates College at Lewiston, Me., Rio Grande College at Rio Grande, Ohio, Storer College at Harpers Ferry, W. Va., Parker College at Winnebago, Minn., and Hillsdale College at Hillsdale, Mich. In connection with the latter institution a theological seminary is maintained. The official organ of the denomination is *The Morning Star*, published in Boston. Reverend H. M. Ford, D. D., of Hillsdale, Mich., is the corresponding secretary of the General Conference.

**BAPTIST YOUNG PEOPLE'S UNION OF AMERICA**. An organization which includes all the young people's societies in Baptist churches in the United States and Canada. Its purpose is the carrying on of educational work, designed to train young people for efficiency in Christian work. The union was organized in Chicago in 1891. Its headquarters are in Philadelphia and Chicago. The union publishes two monthly magazines, *Service* for the senior department, and *Our Junior* for the junior department. These two are now published by the American Baptist Publication Society in Philadelphia. In 1910 the membership was estimated at 600,000. It is international in scope, including all the provinces of Canada as well as the United States. The following are the international officers in 1910: President, W. J. Williamson, D. D., St. Louis; Vice-Presidents,

George W. Truett, D. D., Dallas, Texas; A. H. Vautier, Philadelphia; Rev. H. H. Bingham, London, Ont.; General Secretary, Rev. George T. Webb, Philadelphia; Recording Secretary, Rev. H. W. Reed, Rock Island, Ill.; Treasurer, H. B. Osgood, Chicago, Ill. The union holds annual meetings.

**BAR ASSOCIATION, AMERICAN**. An organization of the leading lawyers of the United States, founded in 1878. It meets annually for the purpose of discussing matters of interest to the profession. Its object is to advance the science of jurisprudence and to promote the administration of justice and the uniformity of legislation throughout the Union. The thirty-third annual meeting of the Association was held at Chattanooga, Tenn., in September, 1910. The retiring president, Charles F. Libby, gave a résumé of the most important legislation enacted in the various States and by Congress in 1910. Committees appointed on the reform of judicial procedure, uniform divorce laws and other important matters with which the Association is concerned, made reports. The officers chosen were: President, Edgar H. Farrar; Secretary, George Whitelock, and Treasurer, Frederick E. Wadhams. Each State and Territory is represented by one vice-president and one member of the General Council. The membership of the Association in 1910 was about 4000.

**BARBADOS**. An island of the West Indies; a British colony. Area, 166 square miles; population (1891), 182,306; estimated (1908), 194,477. Bridgetown, the capital, has about 35,000 inhabitants; Speightstown, 1500. There are 165 primary schools, with an attendance (1908) of 15,932 pupils; 10 higher schools, with 590; and Codrington College, with 17 students. Of the total area about 74,000 acres are under cultivation (35,000 under sugar-cane). The sugar yield in 1908 was about 40,000 hogsheads and 54,428 puncheons of molasses; the cotton crop was 985,256 pounds, valued at £61,578. There are 388 sugar mills and 5 rum distilleries. The fisheries employ about 1000 persons and the annual catch is valued at about £17,000. Imports (1909-10), £1,119,343; exports, £888,086; revenue, £195,803; expenditure, £199,624; public debt, £416,900. Governor (1910), Sir Leslie Probyn.

**BARBOUX, HENRI**. A French lawyer and Academician, died April 25, 1910. He was born at Châteauroux in 1834 and was educated for the bar. He soon acquired celebrity as a pleader, and figured prominently in the Panama canal cases, and in the litigation over Sarah Bernhardt's desertion of the Théâtre Français, and in practically all the great trials of the last half century in which the principles of the commercial law have been involved. He was an advocate of the Cour d' Appel. In 1908 he was chosen member of the French Academy as the best living exponent of French forensic eloquence, and was for some time president of the French Bar Association and vice-president of the Prison Association.

Japan .....	87,939,705	89,707,120
Algeria .....	50,955,392	48,677,050
Tunis .....	9,180,000	6,655,500
Chile .....	2,060,910 (1909-10)	
New Zealand .....	1,061,814 (1909-10)	

The world's barley production in 1910 was below the average. The total yield was estimated at about 1,175,000,000 bushels, as compared with the yield of 1,477,789,000 bushels the year before. In most countries dry weather was the principal factor in reducing the crop. In the United States and Canada the barley crop was reduced by the same unfavorable conditions that interfered with the production of spring wheat and oats. In the spring of 1910 weather and soil conditions favored a ready germination of the seed and a good start of the crop. The preceding fall and winter had been dry and the moisture supply of the soil was insufficient for the proper growth of the crop later in the season when droughts ensued. Although the area devoted to barley in the United States in 1910 was greater by 246,000 acres, the production was less by more than 8,000,000 bushels than the year before. The Canadian yield for the year was 39,388,000 bushels, or over 15,000,000 bushels less than in 1909. The average yield per acre in the United States was 22.4 bushels, the lowest since 1900. In North Dakota where the drought was very severe the average yield was only 5.5 bushels per acre. All States excepting 13 reported barley yields, the more important among them being as follows: California produced 43,400,000 bushels on 1,400,000 acres; Minnesota, 26,985,000 bushels on 1,285,000 acres; Wisconsin, 22,429,000 bushels on 866,000 acres; South Dakota 18,655,000 bushels on 1,025,000 acres; and Iowa 15,045,000 bushels on 510,000 acres. All other States produced less than 6,000,000 bushels. The barley production of the United States for the year represented a farm value of \$93,785,000, which has been exceeded only in 1907. A higher price than in 1908 and 1909 in a measure offset the lower yield. The total value of the crop in 1910 was 16 per cent. above the average of the previous 5 years. According to the report of the Secretary of Agriculture the share of the North Atlantic States in the production of the

barley crop has declined since 1889 from 12.2 to 2 per cent., while the share of the North Central States has increased from 60.3 to 62.8 per cent. and that of the Western States from 26.9 to 34.4 per cent. The exports of barley from the United States in 1910 amounted to about 4,310,000 bushels, as compared with 6,580,000 bushels in 1909.

**BARNARD COLLEGE.** See COLUMBIA UNIVERSITY.

**BARNES, REID.** An American botanist, died February 24, 1910. He was born in 1859. From 1880 to 1886 he was professor of natural history at Purdue University and from 1886 to 1898 was professor of botany at the University of Wisconsin. In the latter year he became professor of plant physiology at the University of Chicago and this position he occupied at the time of his death. He was co-editor of the *Botanical Gazette* and was joint author of *Keys to the Genera and Species of North American Mosses, Plant Life, and Outlines of Plant Life*.

**BAROTSELAND.** See RHODESIA.

**BARRETT, JOSEPH HARTWELL.** An American political writer and public official, died April 10, 1910. He was born at Ludlow, Vt., in 1824 and graduated from Middlebury College in 1845. In 1851 he was admitted to the bar. After serving two terms in the Vermont Legislature he removed to Cincinnati, O. He became political editor of the Cincinnati *Daily Gazette*, serving in that capacity from 1857 to 1861. He took a prominent part in the Republican politics of the State and from 1861 to 1868 was United States Commissioner of Pensions. From 1868 to 1879 he was engaged in editorial work in Cincinnati. He was the author of *Life of Abraham Lincoln, 1860, 1864, 1865; Abraham Lincoln and his Presidency* (1904), and contributed to various reviews.

**BARREN JACK DAM.** See DAMS.

**BARBON, JOHN.** See NECROLOGY.

**BARRY, ALFRED.** A bishop of the Anglican Church, died April 1, 1910. He was born in London in 1826 and was educated at King's College, London, and Trinity College, Cambridge. From 1849 to 1883 he was principal and head master in several educational institutions, including the Leeds Grammar School, Cheltenham College and King's College, London. From 1871 to 1881 he was Canon of Worcester, and from 1875 to 1884 was chaplain to the Queen. He was appointed Bishop of Sydney and Primate of Australia in 1884 and filled this office until 1889. In that year he was appointed assistant bishop in the diocese of Rochester and here he remained until 1891, when he was appointed Canon of Windsor. In 1897 he became assistant bishop in West London, and he held this position until the time of his death. He was a well known scholar, and among his published works are the following: *Introduction to the Old Testament* (1850); *Boyle Lectures* (1876, 1877, 1878); *Christianity and Socialism* (1891); *Bampton Lectures* (1892); *Hulsean Lectures* (1895); *The Position of the Laity* (1903); *The Christian Sunday: Its History, etc.* (1904).

**BARRYMORE, ETHEL.** See DRAMA.

**BARTLETT, EDWARD THEODORE.** An American jurist, died May 3, 1910. He was born in 1841 at Skaneateles, N. Y. After graduating from Union College, he was admitted to the bar in 1862 and practiced in Skaneateles and Syra-

cuse until 1868. He then removed to New York City, where he soon built up a large practice. In 1870 he took an active part in the fight which the Bar Association was waging against a corrupt judiciary, and he was for years a member of the judiciary committee and chairman of the committee on admission of the Association. In 1891 he was nominated for the Supreme Court but was defeated. A few years later he was nominated for the Court of Appeals and was elected after a close contest. He was re-elected in 1897 and would have retained this position until 1911 when he would have been retired for age.

**BARTLETT, ELLIS ASHMEAD.** See LITERATURE, ENGLISH AND AMERICAN, section *Travel and Description*.

**BARTLEY, Sir GEORGE CHRISTOPHER TROUT.** An English philanthropist, died September 14, 1910. He was born in 1842 and was educated at the University College School. Until 1880 he was assistant director of the science division of the Science and Art Department of that institution. In the latter year he resigned to stand for Parliament. He was a member of Parliament from North Islington from 1885 to 1906. In 1875 he established the National Penny Bank to promote thrift. He was the author of a number of books, including *A Square Mile in the East of London* (1870), *Schools for the People* (1871), *Provident Knowledge Papers* (1872), *The Seven Ages of a Village Pauper* (1874), and *The Parish Net* (1875).

**BASEBALL.** The feature of the 1910 baseball season was the winning of the world's championship by the Philadelphia Americans. It was the third time in the history of the two major leagues that the younger organization carried off the laurels. The Chicago Club of the National League, which for the fourth year since 1906 won the pennant in its organization, only succeeded in capturing one game out of five in the world's series. In the American League, Philadelphia took a long lead early in the season and was never closely pressed. The club scored 102 victories and was defeated 48 times. The standing of the other American League clubs follows: New York, won 88, lost 63; Detroit, won 86, lost 68; Boston, won 81, lost 72; Cleveland, won 71, lost 81; Chicago, won 68, lost 85; Washington, won 66, lost 85; St. Louis, won 47, lost 107. In the National League, Chicago, the winning team, finished the season with 104 victories and 50 defeats. Pittsburg, which won the pennant the preceding year played very erratically in the early games and had to be satisfied with third position at the end of the race. New York won second place, with 91 victories and 63 defeats. The other teams and their records follow: Pittsburg, won 86, lost 67; Philadelphia won 78, lost 75; Cincinnati won 75, lost 79; Brooklyn won 64, lost 90; St. Louis, won 63, lost 90; Boston won 53, lost 100. The attendance at the major league contests showed a slight falling off as compared with 1909, totalling 7,279,157. The National League outdrew the American by 105,483, while the previous year the American League games attracted 100,000 more persons than the National. This change is attributed to the fact that the race in the National League was much closer than in the American. The city which had the largest attendance was Chicago, where 1,220,761 persons witnessed the games. The total attendance in the games for

the world's championship was 124,421, or more than 20,000 less than the year before. The receipts, \$174,000, also showed a falling off. The score of these games follows: Philadelphia 4, Chicago 1; Philadelphia 9, Chicago 3; Philadelphia 12, Chicago 5; Chicago 4, Philadelphia 3; Philadelphia 7, Chicago 2. The batting averages were: Philadelphia .317, Chicago .221; and the fielding averages: Philadelphia .945, Chicago .954. The all-round work of Collins, the Philadelphia's second baseman, and the pitching of Coombs of the same team were noteworthy features of the series. The champion batter of the year was Cobb of the Detroit Americans, who won this distinction for the second time in succession. He played in 140 games, made 196 hits and scored 106 runs, finishing the season with an average of .385. Lajoie of the Cleveland Americans also made a remarkable showing with an average of .384. In the National League the leading batter was Magee of Philadelphia, who obtained an average of .331. The most successful pitchers in the American League were Bender and Coombs of Philadelphia and Ford of New York; and in the National, Cole of Chicago and Mathewson and Crandall of New York. A post-season series which attracted considerable interest locally was played between the New York Americans and the New York Nationals. Thanks to the masterly pitching of Mathewson the "Giants" won with four victories and two defeats. One game was a tie. The principal new records made during the year were the playing of a full nine-inning game in 32 minutes by the Mobile and Atlanta clubs of the Southern League and the throwing of the baseball by Lejeune of the Evansville Club of the Central League 426 feet 6¼ inches. This is 25 feet 10¾ inches further than the old record made by Hatfield 36 years ago. The pennant winners in the principal minor leagues in 1910 were: Eastern League, Rochester; American Association, Minneapolis; Southern League, New Orleans; Western League, Sioux City; New York State League, Wilkes-Barre; Tri-State League, Altoona; Connecticut League, Waterbury.

Princeton by its victories over Yale and Harvard may be considered as the champion college team of the year. The scores in Princeton's most important games were: Princeton 2, Pennsylvania 3; Princeton 2, Fordham 3; Princeton 6, Harvard 2; Princeton 7, Harvard 3; Princeton 0, Lafayette 3; Princeton 6, Pennsylvania 6; Princeton 9, Amherst 5; Princeton 2, Yale 4; Princeton 4, Holy Cross 0; Princeton 6, Yale 1; Princeton 3, Yale 2. Yale defeated Andover 9 to 4, Amherst 3 to 2, Columbia 8 to 6, Princeton 4 to 2, and Harvard 12 to 5 and 10 to 9; and lost to Williams 1 to 3, Pennsylvania 4 to 5, Brown 3 to 4, Syracuse 1 to 3, Princeton 1 to 6 and 2 to 3, and Harvard 2 to 3. Harvard won from Brown 6 to 1, Andover 7 to 1, Exeter 3 to 0, Cornell 8 to 1, and Yale 3 to 2. Harvard lost to Amherst 1 to 6. Prince 2 to 6 and 3 to 7, Dartmouth 1 to 2, Fordham 2 to 5, and Yale 5 to 12 and 9 to 10. Pennsylvania's principal victories were over Princeton 3 to 2, Yale 5 to 4, Cornell 2 to 1 and again 2 to 1, and Syracuse 14 to 0. Pennsylvania was defeated by Cornell 0 to 6, Lafayette 0 to 2, and Brown 1 to 2.

**BASKETBALL.** The fact that there was

no college basketball league in existence in 1910 made it impossible to pick a champion team. Four institutions which were represented in the league of 1909, however, finally came to an agreement and played a series of games. The teams were those of Columbia, Princeton, Pennsylvania and Yale. Columbia made the best showing, scoring a total of 165 points as against a score of 80 made by the opposing "fives." The New York College defeated Princeton by 40 to 9 and 27 to 15; Yale by 29 to 21 and 17 to 11; and Pennsylvania by 33 to 11 and 19 to 13. Pennsylvania defeated Yale 31 to 20 and Princeton 33 to 15 and lost to Columbia 11 to 33 and 13 to 19, Yale 18 to 19 and Princeton 20 to 31. Yale defeated Princeton 32 to 22 and Pennsylvania 19 to 18 and lost to Columbia 21 to 29, to Princeton 24 to 38 and to Pennsylvania 20 to 31. Princeton defeated Pennsylvania 31 to 20 and Yale 38 to 24 and lost to Columbia 9 to 40, and 15 to 27, to Pennsylvania 15 to 33 and to Yale 22 to 32. New York University had another most successful season, scoring 463 points as against 332 scored by the opposing teams. The N. Y. U. five was victorious over Pratt by 34 to 18, Swarthmore by 22 to 13, Yale by 18 to 16, Union by 16 to 12, Rochester by 34 to 30, Princeton by 34 to 18, Syracuse by 16 to 9, and Colgate by 19 to 18. The only teams to defeat New York were Colgate by 25 to 20, Rochester by 25 to 17 and Wesleyan by 33 to 28. Williams and Wesleyan were rival claimants for the championship of the New England colleges.

**BASUTOLAND.** An elevated plateau north-east of the Cape of Good Hope Province, directly under the authority of Great Britain. Area, 10,293 square miles. Population (census of 1904), 347,731 natives and 805 whites; estimated (1907) 351,000. Capital and largest town, Maseru, with 13,000 inhabitants. There are 12,195 pupils in the 248 schools, which receive a grant in aid of £12,000. It is an excellent grain region, and large herds of cattle are found on well-watered and extensive pastures. Wool, wheat, mealies and Kaffir corn are raised; iron, copper and coal are found. The imports (chiefly ploughs, woolen and cotton goods, iron and tinware) in 1908-9 were valued at £239,830; exports (grain, wool and livestock), £193,122. Basutoland belongs to the South African Customs Union. The roads are fair, but there are no navigable waterways. There are 16 miles of railway, connecting Maseru with the Bloemfontein-Modderpoort line at Marseilles station. Revenue and expenditure (1909-10), £119,974 and £127,437 respectively. There is no public debt. The paramount chief is Letsie. A resident commissioner (1910, Herbert Cecil Sloley) administers the territory under the direction of the governor-general for the Union of South Africa.

**BATAILLE, M.** See FRENCH LITERATURE.

**BATH TUB TRUST.** See TRUSTS.

**BATTLESHIPS.** All-big-gun-one-calibre battleships of great displacement, generally turbine-driven, are being built by all the great naval powers of Europe, by the United States, Japan, Argentina, and Brazil. The British have adopted the American plan of mounting the turrets in the centre-line, and not in echelon; and the 13.5" gun has been introduced to replace the 12". The battle cruiser *Lion*, 26,350 tons displacement, launched on August 6, 1910, will

be the first ship to carry the new type of 13.5" guns, mounting 8 13.5" guns in four turrets on the centre-line. The *Super-Lion* has not yet been ordered. It will displace 27,200 tons, develop 82,000 H. P., and make 30 or 31 knots. It will mount the same guns as the *Lion*, 8 13" and 16 4.7" guns. Vickers, Sons & Maxim will probably be the builders, as they will launch the *Princess Royal* soon. The United States has adopted the 14" gun after exhaustive tests of an experimental gun; and, even before these guns are in service, there are enthusiasts who would have them superseded by 16" guns in the two battleships Congress will be asked to provide at the present session (December, 1910).

The new battleships *Texas* and *New York*, 27,000 tons displacement, provided for in the last naval appropriation, will carry 10 14" guns. The daily press reports that Germany also has been experimenting with 14" guns. In the latest German battleships, the 12" guns have replaced the 11". Italy and Russia have adopted the triple-gun turret. It is reported that the *Dante Alighieri*, 19,500 tons, is to carry 10 12" guns in four turrets on the centre-line, the lower turrets being triple; and that the three ships of the *Conte di Cavour* class will carry 13 12" guns in five turrets, all on the centre-line, the three lower turrets being triple. The new Russian ships will carry 12 12" guns in four triple-gun turrets, all on the centre-line.

The secondary battery, 12 pdrs. in the *Dreadnought* of 1906, become 4" guns in the *Bellerophon* and *St. Vincent* types; 5" in the *Neptune*, and 6" in later battleships and battle cruisers of the British navy. The 5" gun has been adopted for secondary batteries in the U. S. Navy. It was soon decided that the 3" gun could not stop the modern torpedo vessel. Then improvements were made in torpedoes which gave a range of 4000 yards; and now the British Navy has a torpedo with a range of 7000 yards, making a 5" or 6" gun necessary for the torpedo defense battery. The intermediate gun, therefore, again forms part of the battery of a battleship. The opponents of the all-big-gun-one-calibre ship claim that the "hail of fire" from a battery of intermediate guns will demoralize and destroy the personnel and wreck the unarmed parts of the enemy; and therefore play an important part in putting him out of action. The all-big-gun school claim that battles will be fought at long range; that the intermediate gun would be useless except for torpedo defense, and that their fire would interfere with the control of the fire from the heavy guns. Their opponents answer that although battles may commence at longer range than in the past, no decisive battle can be fought except at medium ranges on account of average conditions of weather at sea, and the small percentage of hits at long range. This initial long range is the result of the increased range, speed and accuracy of the torpedo, and the adoption of modern heavy guns with high muzzle velocity, and flat trajectory, and increased danger space. The Japanese intermediate guns did do frightful damage to the Russian ships, but they were replaced on battleships solely as torpedo defense guns, however useful they may prove to be at other times. It is said that one of the special features of the British *Lion* and *Orion* classes is the disappearing anti-torpedo armament, made possible by all the big guns being placed on the centre line.

Dreadnoughts have increased greatly in size;

super-Dreadnoughts have had to make way for the very "latest greatest." The *Dreadnought*, completed in 1906, of 17,900 tons, yields to the latest *Super-Dreadnought* of 23,500 tons displacement and the *Orion*, launched August 20, 1910; and the battle cruiser *Indefatigable*, 19,200 tons (improved *Invincible* class), laid down in February, 1909, is followed by the *Lion* class, 26,350 tons. The United States is practically building ships of 27,000 tons; and plans have been made for a 31,000 ton ship.

Orders for the five British capital ships of the 1910 programme were placed in December. They are to be ready in the spring of 1913; and will displace 27,000 tons; will carry 12 13.5" guns, and a strong secondary battery, with ample protection.

Vickers, Sons & Maxim have secured a contract to build a Japanese Dreadnought battle cruiser, to be from 27,000 to 28,000 displacement, and to cost about £2,500,000.

The Fore River Ship & Engine Co. are building two Dreadnoughts for Argentina: displacement 27,500 tons; turbines of 39,500 H. P.; speed 22.5 knots; to make 3600 miles at full speed, and 7200 miles at 15 knots, and 10,000 at eleven; besides 4500 tons of coal, 660 tons of oil fuel will be carried, and the displacement at full load will be 30,000 tons; complete armor belt; 12 12" guns in six turrets, four on centre-line, and two in echelon; 12 6" and 12 4" guns; two submarine tubes for 22" torpedo. They are improved Brazilian Dreadnoughts.

England, Germany, and Japan are still building so-called armored cruisers (battle cruisers). The most recent British ships are greatly superior to the contemporary battleships in displacement and speed, but carry fewer heavy guns of the same calibre, and have less armor protection. They are really fast battleships; and are now so accepted.

We are used to the statement that a battleship is a compromise, but the greater the tonnage the less is the compromise. The battleship *Orion* is designed for 14 knots, the battle cruiser *Lion* for 28; while the *Dreadnought* makes 21, and the *Invincible* 25. It is said that no British armored vessel will be built hereafter that will not make more than 21 knots.

Increased tonnage has permitted better armor protection. Battleships generally only carried armor amidships; but are now protected throughout their whole length.

The underwater body of battleships is still unprotected against mines, and the attack of submarines and torpedo craft, except by a minute water-tight subdivision.

Simplicity of fire control was a large factor in the adoption of the all-big-gun-one-calibre ship. The high lattice fire control towers on American ships have not found favor in Europe, where it is thought that excessive vibration will interfere with their efficiency. The British still use tripod masts; it is stated that the *Hercules* and *Colossus* will have only one tripod mast each, mounted abaft the forward funnel. On some ships separate fire control stations have been erected; and the tendency now is toward armored stations. It is likely that high unprotected stations will be used for long range firing; and that the lower armored stations will be reserved for medium ranges. In connection with the low-armored fire control station, experiments have been made in "spotting" by means of an extension of the periscope system used in submarines;

it is thought that the Germans have adopted some such system. See NAVAL PROGRESS.

**BEACH, HENRY HARRIS AUBREY.** An American surgeon, died June 28, 1910. He was born at Middletown, Conn., in 1833 and was educated at the public schools. From 1864-66 he served in the hospital service of the United States Army. He graduated from the medical department of Harvard College in 1868 and from that time until the time of his death was engaged in the practice of his profession in Boston. From 1869-79 he was assistant demonstrator in anatomy at Harvard, and from 1879 to 1884 was demonstrator. He was instructor in clinical surgery from 1898 to 1900 and lecturer from 1900 to 1906. In 1907 he was appointed consulting surgeon to the Massachusetts General Hospital. In 1868-9 he was assistant editor of the *Boston Medical and Surgical Journal*. He was a member of many medical and other learned societies and contributed many articles and papers to medical journals and transactions of medical societies.

**BEAUX ARTS ARCHITECTS, SOCIETY OF.** An association of American graduates of the École des Beaux Arts of Paris. The society originated in 1902 a system of educational work which has had great influence on architectural study in the United States. This system includes the establishment in different cities of the United States of ateliers or schools in which instruction on architecture may be obtained. The instruction is based on that given in the École des Beaux Arts. The programmes of the society are also used in many of the colleges and universities of the country, and by arrangement with several universities which have schools of architecture students of the society may receive instruction in the night courses and university extension lectures of these universities. The ateliers in each city are formed by a group of students who wish to carry on the study of architecture. A master or patron is chosen or appointed, and the atelier is supported by contributions from the students. The work of the patron or master is given free. Each year the Committee on Education of the society issues a certain number of programmes which include the problems to be worked out at the different ateliers. These competitions are designated "Class A" and "Class B" competitions.

The work of the society has shown great progress since the organization of its educational department in 1902. In that time it has grown from 51 to approximately 600 registered students for the year 1909-10. Before the close of the season in July, 1910, 729 students had actually registered, practically all of whom had entered

into at least one of the twenty-nine "Class A" or "Class B" competitions.

The society awards four prizes: the Warren Prize, offered for general excellence in planning a group of buildings; the Pupin Prize, gift of Professor M. I. Pupin of Columbia University, offered for decorative treatment of some scientific appliance; the Goelet Prize, gift of Mr. Robert W. Goelet, offered for excellence in planning a city block; and the Bacon Prize, gift of Mr. Robert Bacon, offered in December for the greatest number of honors obtained in Class A. The amount of the prize for the first three prizes named was \$50 for the first prize. The Bacon Prize is \$100 for the first prize and \$60 for the second prize. The society offers a Paris Prize, the gift of Mr. Robert Bacon. The winner of this prize is chosen to pursue his studies in the first class in the École des Beaux Arts, Paris, according to the regulations for this end adopted by the French Minister of Public Instruction and Fine Arts. The winner of the prize receives \$250 quarterly for two years and a half, dating from his departure for Europe. All who entered the competition must have been under 27 years of age on July 1, 1910. Ateliers have been organized in the following cities: New York City, 6; Los Angeles; Chicago, 2; Baltimore, Buffalo, Portland, Ore., Seattle, St. Louis, Milwaukee, Cleveland, Washington, Boston, Newark, N. J., and Montreal, Canada. Sixteen universities, colleges and technical schools used the programme of the society for its competitions in 1910-11. The chairman of the Committee on Education of the society is James Otis Post, 347 Fifth Avenue, New York City.

**BECHUANALAND PROTECTORATE.** A British South African possession lying between the Malopo and Zambesi rivers, and stretching from the Transvaal to German Southwest Africa. Area, about 275,000 sq. miles; population (estimated 1907), 132,000 natives and 1100 whites. Serowe, the capital of the Bamangwato tribe, has 17,000 inhabitants. The Bakhatla, Bakwena, Bangwaketse, and the Batawana are other important tribes. There are government-aided mission schools. Cattle-raising and agriculture are the principal industries. The imports for 1908 were valued at £90,838; exports, £64,538 (not including the proceeds from the sale of 3983 head of cattle, about £25,000). Exports of raw gold were valued at £20,188. The protectorate belongs to the South African Customs Union. Both the railway and telegraph from the Cape of Good Hope to Rhodesia traverse the protectorate. There are 12 post-offices. Revenue and expenditure for 1909-10 were given at £49,787 and £65,267 respectively; grant in aid (1908-9) £39,000; (1909-10) £31,000. The tribal chiefs are under the direction of a resident-commissioner (1910, Lieut.-Col. F. W. Panzera), having headquarters at Mafeking (British Bechuanaland) and acting under the governor-general for the Union of South Africa.

**BELDEN, JESSIE (VAN ZILE).** An American author, died February 2, 1910. She was born at Troy, N. Y., 1857, and was educated at Troy Female Seminary and St. Agnes' School, Albany. She married, in 1878, James Mead Belden. In 1898-9 she was State Regent of the Daughters of the American Revolution. She was appointed by Governor Roosevelt and reappointed by Governor Odell a member of the Board of Managers of the State Reformatory, Hudson, N. Y. Among her published writings are the following: *Fate at the Door* (1895); *The King's Ward* (1898); and *Antonia*. She also contributed many other stories to various magazines.

**BELGIAN ARCHITECTURE.** See ARCHITECTURE.

**BELGIAN CONGO.** See CONGO, BELGIAN.

**BELGIAN RAILWAY COMPANY.** See EXPLORATION.

**BELGIAN SWAMP LANDS.** See DRAINAGE.

**BELGIUM.** A constitutional monarchy of western Europe. Its capital is Brussels.

**AREA AND POPULATION.** Area, 11,373 sq. miles. Population (1900), 6,693,548; estimated 1908, 7,386,444; 1909, 7,451,903. The marriages in 1908 numbered 57,564; in 1907, 58,660; total living births, 183,834 (in 1907, 185,138); still-born, 8563 (in 1907, 8311); deaths, 121,964 (in 1907, 115,347); divorces, 892 (in 1907, 841). The immigrants in 1908 numbered 38,155 against 38,921 in 1907, the emigrants, 32,294 against 32,350. The estimated population of Brussels, (with suburbs), December 31, 1908, was 637,807; Antwerp, 314,135; Liège, 175,870; Ghent, 163,763; Mechlin, 59,218.

**EDUCATION.** Primary education is compulsory, and each commune must maintain at least one primary institution, with state aid. The primary schools numbered, in 1908, 7355, with 914,709 pupils; infant schools, 2985, with 267,994 pupils; state normal schools, 54, with 4755 students; adult schools (state), 4473, with an attendance of 227,220. Number of teachers, 40,660 in 1908-9. Amount expended (1907), 53,029,291 francs.

The secondary normal schools had an enrollment in 1908-9 of 196 (182 in 1907-8); the various establishments (state, communal and provincial) for secondary education had in 1908-9 a total of 35,436 pupils (35,027 in 1907-8). Amount expended (1807), 8,396,282.23 francs.

The university students (1908-9) were distributed as follows: Gand, 443; Liège, 1670; Brussels, 845; Louvain, 1688. The technical and special schools attached to the universities had a total of 2299 students. In 1908, 8.46 per cent. of the military recruits could neither read nor write; in 1890 the percentage was 15.92.

The State paid out of the national treasury in 1909 the following grants to religious bodies: to Roman Catholics, 7,261,300 francs; to Protestants, 104,700; to Jews, 25,600. Roman Catholicism is the State religion, but entire religious liberty prevails.

**AGRICULTURE.** Of the 1,736,174 hectares under cultivation, the areas devoted to the principal crops in 1907, and the production for 1906 and 1907, are given as follows:

	Hectares 1907	Quintals 1906	Quintals 1907
Wheat .....	158,845	3,523,088	4,309,500
Barley (winter) ..	32,578	807,385	1,003,648
Oats .....	248,423	6,564,840	6,667,793
Rye .....	259,723	5,224,696	5,965,333
Potatoes .....	142,749	24,127,000	24,001,884
Beets (sugar) ....	53,322	17,489,228	14,535,180
Beets (other) ....	62,443	34,155,029	32,928,164
Tobacco .....	2,831	68,044	61,529
Hops .....	2,341	34,948	30,780

On December 31, 1907, the livestock numbered 1,817,689 cattle, 249,831 horses, and 1,279,462 swine.

**MINING AND METALS.** There were 130 coal-mines in operation in 1908, employing 145,280 persons; the output, 23,537,900 tons, was valued at 380,579,000 francs (1907: mines, 125; employes, 142,699; output, 23,705,190 tons; value of output, 399,657,000 francs). In 1908, 188,780 tons of iron were mined (value, 992,800 francs), against 316,250 tons, valued at 1,503,000 francs, in 1907; 357 tons pyrites (2300); 2099 blende (150,700); 195 lead (29,450); 7130 manganese (124,650). There were 53 blast furnaces and pig-iron works in operation in 1908, with 3667 workmen and an output of 1,270,050 tons, valued at 85,883,000 francs; 253 iron manufactories, 9830 workmen, 484,390 tons, 41,584,000 francs; 119 steel works, 15,778 workmen, 2,772,030 tons, 304,139,000 francs. The product of the zinc works (7156 workmen) was 161,940 tons, valued at 80,383,000 francs; lead (1630 workmen), 35,650 tons, 12,121,000 francs. Iron ore to the value of 12,532,481 francs was imported from Luxemburg in 1907; in 1908, 8,722,909 francs. The pig and manufactured iron produced in 1907 and the value in 1907 and 1906 are as follows:

	Tons 1907	Francs 1906	Francs 1907
Pig iron.....	1,378,290	97,409,000	104,116,000
Mfgd. iron.....	358,500	53,303,000	57,708,000

The quarries (1680 in 1908, 1630 in 1907) had in 1908 an output valued at 62,874,600 francs (65,356,710 in 1907) and employed 36,877 workmen (36,909 in 1907).

**OTHER INDUSTRIES.** The glass industry grows annually. In 1906 there were 69 factories, employing 31,100 workmen, with a total output valued at 101,710,000 francs, of which about 75 per cent. was exported. Belgium holds fourth place among the world's flax-manufacturing countries (Ireland, France, Russia); 161,000 tons in 1907, 158,000 in 1908, 174,000 in 1909 having been imported to supply the 320,000 spindles in operation. The lace-makers numbered, in 1907, 45,000; against 150,000 in 1875. There were 97 sugar manufactories at work in 1907, with an output of 227,015 tons of raw sugar; 23 refineries, 107,398 tons; 135 distilleries, 66,763 kilolitres of alcohol at 50° G.-L. The fishing vessels (1907) numbered 537, and the catch was valued at 6,312,752 francs.

**COMMERCE.** The trade for three years is given below in thousands of francs:

	1907	1908	1909
Imports .....	3,773,600	3,327,400	3,704,300
Exports .....	2,848,100	2,506,400	2,809,700
Transit .....	2,343,000	2,021,000	2,290,400

Principal articles of the 1909 special trade are given with their value in thousands of francs:

Imps.	1000 fr.	Exps.	1000 fr.
Cereals, etc.....	643,200	Iron, etc.....	214,600
Wool .....	178,800	Cereals, etc.....	210,300
Skins .....	170,200	Machinery .....	143,700
Timber .....	165,300	Skins .....	140,100
Seeds .....	153,200	Flax, spun.....	97,300
Resins .....	131,200	Flax, raw.....	96,100
Rubber .....	103,000	Seeds .....	95,700
Chem. prods.....	102,800	Diamonds .....	92,800
Diamonds .....	95,200	Woolens .....	90,400
Coal .....	95,000	Zinc .....	90,300
Cotton .....	83,700	Coal .....	82,200
Dyes .....	88,900	Glass .....	78,000
Iron, etc.....	84,900	Chem. prods.....	66,300
Flax .....	83,300	Cottons .....	65,300
Coffee .....	61,600	Sugar .....	43,900

Imports from France were valued at 473,650,000 francs; exports to France, at 451,900,000; Germany, 494,900,000 and 729,700,000; Great Britain, 456,800,000 and 372,500,000; Russia, 326,200,000 and 40,900,000; Argentina, 320,200,000 and 90,200,000; Netherlands, 282,600,000 and 310,900,000; United States, 277,200,000 and 107,100,000; British India, 167,700,000 and 35,200,000; Rumania, 112,600,000 and 9,200,000. Vessels entered, 10,539, of 14,283,345 tons; cleared, 10,519, of 14,274,014.

**COMMUNICATIONS.** The total length of railway lines at the beginning of 1909 was 2898 miles, of which 2670 miles were operated by the state and the remainder by private companies. The following statistics are for the year ending December 31, 1908: Total passengers carried, 176,821,515; receipts (state), 268,352,414 francs (269,168,242 francs with certain indirect profits) and (private companies) 20,445,528; expenditure (state) 182,772,882 francs, and (private) 13,605,154. Length of telegraph lines, 4523 miles; wires, 24,187 miles; number of offices, 1378; telegrams sent, 7,472,746; receipts, 5,619,820 francs; expenditure, 5,004,434. Length of telephone wires, 107,994, entirely state-owned; receipts, 7,602,063 francs; expenditure, 7,255,997 francs. Number of post-offices, 1485; receipts, 35,939,748 francs; expenditure, 18,675,113. Length of roads, 5988 miles; of navigable rivers and canals, 1349. Merchant marine, 88 vessels of 152,325 tons net.

**FINANCE.** The unit of value is the franc, worth 19.3 cents. Revenue and expenditure are given below for four years in thousands of francs (1909, budget voted):

	1906	1907	1908	1909
Rev. ord.....	597,168	617,808	616,986	633,199
" extraord....	3,468	1,466	829	.....
Exp. ord.....	591,522	615,237	613,021	635,719
" extraord....	180,844	152,536	157,430	.....

The budget for 1909 is detailed below:

Rev.	1000 fr.	Expend.	1000 fr.
Direct taxes.....	70,201	Debt .....	185,526
Customs .....	64,778	Civil list.....	5,354
Excise .....	81,328	Justice .....	30,276
Registration, etc.	74,553	For. Affairs ..	4,182
Stamps, etc.....	1,301	Interior, etc....	18,345
Rys., Tels., etc.	319,254	Arts, etc.....	35,209
Domains, etc....	23,998	Col. office.....	996
Repayments, etc.	7,786	Industry .....	23,960
		Rys., etc.....	222,826
Total .....	633,199	War .....	56,890
		Gendarmerie ..	56,890
		Finance .....	9,355
		Pub. Works.....	22,033
		Repayments .....	17,967
			635,719

The debt stood, Jan. 1, 1910, at 3,580,859,751 francs.

**BANKS.** The condition of the National Bank (the only bank of issue) on Dec. 31, 1909, was as follows: Cash on hand, 158,912,458 francs; portfolio, 715,652,835; advances on public funds, 63,303,856; public funds, 49,013,427; notes in circulation, 845,015,550; accounts current, creditors, 112,570,183; reserve, 37,276,767. The state savings banks had, Dec. 31, 1908, 2,624,991 depositors with deposits amounting to 886,240,741 francs (2,528,207, with 843,731,385 francs, in 1907). There are agricultural, joint-stock, private, and popular banks, and credit unions.

**GOVERNMENT.** The executive power lies in the King: Albert, born 1875, son of the late Prince Philippe de Saxe-Coburg and Gotha and of Flanders; married (1900) to Princess Elizabeth of Bavaria; succeeded his uncle, Leopold II, December 17, 1909. Heir-apparent, Prince Leopold, born Nov. 3, 1901. The King is aided by a responsible ministry of ten members. The legislative body is the Parliament, made up of the Senate (110 members), and the Chamber of Representatives (166 members). The ministry in 1910 was made up of the following members: Premier, Minister of the Arts and Sciences, F. Schollaert; Justice, L. de Lantsheere; Foreign Affairs, J. Davignon; Interior, P. Berruyer; Finance, J. Liebaert; Agriculture and Public Works, G. Helleputte; Industry and Labor, A. Hubert; Railways, Posts, and Telegraphs, Ch. de Broqueville; War, Lieut.-Gen. J. Hellebaut; Colonies, J. Renkin.

**ARMY.** The reorganization provided for by the legislation of 1909 was in progress during the year. The new establishment consisted of 42,800 men on a peace footing, and 180,000 on a war footing, while the entire peace effective strength of the army was 3543 officers and 43,988 men, including some 2000 civilian employees. The war effective of the field army was stated at 2713 officers and 98,696 men and 26,068 horses. One son in each family is liable for military duty, and in 1910 there were 28,299 men of age available for enrollment in the annual contingent. Of these 9086 were withdrawn by the militia boards, and of the remainder about 2000 were expected to be able to meet the requirements of the medical boards; consequently, an annual contingent of 17,000 men was expected as compared with the annual volunteer quota of about 13,000, which had been found insufficient to secure an army of proper size. The Belgian army was composed of 8 regiments of cavalry, each consisting of 4 active squadrons and one reserve squadron. There were two regiments of chasseurs, 2 of guides and four of lancers. The field artillery, reorganized in the fall of 1910, consists of 4 brigades, each of two regiments composed of six field batteries; a reserve of 12 field batteries and ammunition columns are maintained, and there are 4 horse batteries. There was one regiment of engineers consisting of 3 battalions and the reserve battalion, and 5 companies of technical troops. The infantry comprises 14 regiments of the line each consisting of 4 battalions, of which 3 are active and 1 reserve; one regiment of grenadiers with an organization similar to that of the line, one regiment of carbiniers of 6 battalions, 4 of which are active and 2 reserve, and 3 regiments of chasseurs-à-pied.

There is also a Civic or National Guard which is organized on a military basis, but in time of peace is under the Ministry of the Interior and

numbers approximately 45,000 actives and 100,000 non-actives. Under the law of 1909 the obligation for military service consists of 15 months for infantry, fortress artillery and engineers, 24 months for cavalry and horse artillery, 21 months for field artillery, 12½ months for service in administrative corps. The total service under the new arrangement including the later training will be 20 months for the infantry, 36 months for horse artillery and cavalry and 28 months for the field artillery and army service, 22 months for the fortress and special artillery companies, 24 months for the administrative service.

It was announced during the year that the war budget for 1911 would amount to 59,935,440 francs, an increase of 3,045,148 francs over the amount allotted in the budget for 1910. The effective strength thus provided for was 3540 officers, 41,028 men and 2053 employees, of which 1800 were in the military service, and 10,171 horses of which 2014 are for officers and 8157 for the troops. In comparison with the report of the effective strength for 1910 this is an increase of 92 officers, 1022 horses. To this effective should be added that of the gendarmerie—76 officers, 3519 men of which 1749 are mounted; 1844 horses of which 95 belong to officers; an increase of 4 officers and 154 men and a decrease of 80 horses over the figures of the previous year.

In Belgium the gendarmerie forms at times of mobilization 4 squadrons. The new budget provided for the creation of new regiments of artillery and increased pay. There were also appropriations of 1,160,500 francs to complete the supply of field artillery for the reserve and of 250,000 francs for ammunition for the field artillery. The Minister of War reported to the Chamber the draft of the law fixing the contingent of recruits for 1911. The contingent for the foot army was fixed in time of peace at a maximum of 100,000 men and the effective mean of the infantry in time of peace was fixed at 42,800 men. In the training of 1909 and 1910 the main peace effective was 40,314 men, exceeding by 1867 men that of the preceding training period, but less by 2500 men in round figures than the mean of 42,800 provided for by law. In 1910, 61,072 were enrolled. Belgium has no navy.

#### HISTORY

**THE MAY ELECTIONS.** The general result of the elections was favorable to the Opposition, but did not come up to their expectations. In spite of the efforts of the Socialists and Liberals, who in most of the election districts had formed an alliance, they gained only one seat from the government. On the other hand, the government, which had expected to regain a number of seats won by the Opposition in the last elections by a small majority, saw that majority increased. In general, throughout the country there was a slight increase of the anti-Clerical vote, although the anti-Clericals and the Catholics were left practically on an equal footing. The government majority was reduced by the election to six votes, which, small as it was, was regarded as sufficient to keep it in power. The division of parties and their general policies may be briefly outlined as follows: The Democratic element in the Parliamentary Right favored some of the measures of the Opposition. It was the union of this Democratic element with the Left that had carried the new military law of 1909, which fixed the peace strength at 42,800 and provided for personal service (one

son in a family). A number of its members favored obligatory instruction and a reform of the electoral laws, which were measures demanded by the Opposition. As to obligatory instruction, the Right were not willing to concede that reform unless the free schools, that is to say the schools established and maintained by the Catholic Church, should receive substantial subsidies. The previous budget had made provision for a considerable grant to these schools and it was understood that this concession would be carried further. However, the Catholics desired a law compelling the communal governments to grant to the free schools an amount equal to that which was spent on the official schools. Such a plan was highly objectionable to the Liberals and the Socialists, while on the other hand obligatory instruction was offensive to the Catholic party. The project of electoral reform had already come before Parliament. It had received the approval of the commission appointed to consider it. The attitude of the government toward it did not seem to be favorable. It aimed at a unification of the electoral laws extending proportional representation as employed in the legislative elections to the elections for the provincial and communal councils, and reducing the age for voting from 30 to 25 years.

**THE MINISTRY.** M. Schollaert continued as Premier. Two changes were made in the ministry. Baron Descamps, Minister of Arts and Sciences, and M. Delbeke, Minister of Public Works, lost their places in the cabinet, but more for personal than political reasons. Baron Descamps, who had been a professor in the University of Louvain, aroused much criticism and even ridicule by his excessive patronage of the artistic and literary classes, which was attributed to his own literary ambitions. He was the author of a drama in verse celebrating the achievements of Leopold II in Africa. Moreover he had not been successful in meeting the attacks of the critics who opposed the government's policy toward the schools. The title of the portfolio had been changed from Public Instruction to Arts and Sciences, and it was understood that the Minister should henceforth devote his attention, not only to the official schools, but to the free schools subsidized by the government. M. Delbeke had been active in carrying out the late King Leopold II's extensive building projects, which had encountered severe criticism. Under the new reign he was no longer needed.

**LEGISLATION.** The Chamber passed the Congo budget on Feb. 17. The law for the reorganization of the Councils of Prudhommes was passed. This gave women the right to vote and introduced proportional representation. It also extended the jurisdiction of the Councils to employees of commercial houses. It was to go in force in March, 1911. Another important law to pass Parliament was that concerning the employment of Flemish in secondary education. It provided that Flemings should not be admitted to the University courses unless they have received an education in Flemish, but in order to conform to the constitutional provision guaranteeing freedom of education, a delay in its execution was necessary, and the new rule was not to apply except to those who had not yet begun their secondary studies. For six years no restriction was to be placed upon the inhabitants of the Flemish provinces

who had not pursued their studies in Flemish.

**THE NIEDERFULLBACH FOUNDATION.** M. Renkin, Minister for the Colonies, was criticised for his alleged association with certain financial irregularities in Congo affairs on the part of the late King Leopold. When the treaty for the annexation of Congo to Belgium was under discussion, he had urged that the state should place at the King's disposal the sum of 50,000,000 francs, to be expended without rendering any account to the Chamber, and he had argued that it would not be proper to demand from the Congo administration a statement as to the 130,000,000 francs which had been already borrowed and which was to become a debt to be borne by the new Colonial administration. To those who insinuated at the time that the money had been improperly expended, M. Renkin replied that he was certain that the loans had been borrowed for the benefit of the Colony. On the death of the King the Niederfullbach affair came to light. The King for a long time had been manoeuvring to carry out in Belgium, independently of the government, such public works as he desired, and to this end had established the Crown Foundation, with extensive territories in Africa, whose revenues were to be applied by officers in his confidence to such purposes as he wished. He sought to have the Crown Foundation recognized in the treaty of annexation, but this was unanimously rejected by the Chamber, which insisted on the suppression of the Foundation. Nevertheless, the new Colony assumed all the obligations that the King had already incurred on this account, and furthermore bestowed on him a special fund of 50,000,000 francs for carrying out some of the projects that he had in mind. The King violated the spirit of this agreement. Although the Crown Foundation was publicly abolished, he established a similar Foundation in the Duchy of Coburg, whence the royal family had sprung, known as the Niederfullbach Foundation. Thus it was found after the death of the King that he had employed the money to endow this new Foundation in a foreign country, whose revenues were to be applied to furthering the King's personal policy in Belgium. When this was revealed, M. Renkin was obliged to admit in Parliament that he had spoken ill-advisedly and without verification when he had told them, on the authority of personal counselors of the King, that the entire debt of the Congo had been fully accounted for. He added, however, that the new Colony would recover the money expended in the Niederfullbach Foundation, and would lose nothing. But this was not done and the money which had been applied to the Coburg project appeared to be beyond recovery. Against the claims of the state, it was urged that the Niederfullbach expenditures were beyond their jurisdiction, that they had not been noted in the accounting which had been made after the treaty of resumption, and if the grants of King Leopold were invalid, his daughters, as his legal heirs, were alone able to present a claim. In December Princess Louise brought suit against the government for the recovery of the property comprised in the Niederfullbach Foundation and also against an officer of the late King for the recovery of money which, it was alleged, he had turned over by the King's order to Baroness Vaughan. Another financial difficulty arose with the Congo concessionaries. The treaty

formally stipulated that all rights conceded to third parties should be maintained, and King Leopold had made free use of the right of concession, giving to certain financiers with whom he was associated the right to exploit the domain. One of these concessionary companies, that of the Kasai, claimed an indemnity of 40,000,000 francs from the Belgian Colony because the Colonial administration had abolished the monopoly that it had acquired over all the state's domain, established commercial liberty and authorized the free exploitation of the forests. The state had a sufficient share in the concessionary companies to control the meetings of the stockholders, but the Kasai Company claimed the right of administering without calling meetings of stockholders.

**THE NEW KING.** The private life of the late King Leopold offered a marked contrast to that of his successor. King Leopold was not less noted for his dissolute private life than for his lack of political scruples. A large part of his fortune was settled upon Baroness Vaughan, who had been a barmaid, and was the daughter of a janitor at Budapest, and who claimed a morganatic marriage. His will divided \$3,000,000 among his three daughters, none of whom could succeed to the throne by the Salic law. His only son had died at the age of nine. King Albert, who was born in 1875, was his nephew. He married on October 2, 1900, Princess Elizabeth of Bavaria, by whom he has had three children. His private life has been without reproach and in political matters he is known to be progressive. He has made a special study of social and economic sciences and has given much thought to current political questions. As to the Congo policy he differed radically from King Leopold, and declared at the time of his accession that the Belgian government must administer Congo affairs humanely. He himself has visited the Congo and considered plans for the improvement of conditions there. In the new budget passed by the Chamber of Deputies, the principle of forced taxation, which had been so severely criticised, was retained. Those interested in Congo reform declared that the abuses would certainly continue if it was permissible for the administration to demand from every village a certain quantity of rubber without regard to their ability to raise it. **BERGER, GEORGES.** A French critic and essayist on art, died July 8, 1910. He was born in 1834 and was educated at the Lycée Charlemagne. He was the proprietor of profitable vineyards, and was able to devote himself to art. He gave all his leisure to the study of ancient and modern art objects and wrote extensively on art topics for the *Journal des Débats*. He was the author also of an important work entitled *The French School of Painting from Its Origin down to the Reign of Louis XIV* (1879). Among his important services to art was the use of his influence in causing the French Par-

liament to concede the Pavillon de Marsan in the Louvre to the Society of the Central Union of Decorative Arts. In collaboration with Le Play he had charge of the decorative arts section of the Universal Exhibition of 1867 and he was director of the foreign arts section of the exhibition of 1878. He acted as director-general of promotion in the exhibition of 1899. He held the position of professor of æsthetics and of the history of art in the National Fine Arts School of France and was an officer of public instruction and member of the Chamber of Deputies of the Department of the Seine, a member of the Institute of France, of the Higher Council of Fine Arts and of the Council of National Museums.

**BERGERET, DENIS PIERRE.** See NECROLOGY.

**BERIBERI.** The connection between a rice diet and beriberi has long been recognized, but the precise manner in which rice acts as an ætiological factor has been a matter of dispute among sanitarians in the East. Many observers have failed to admit that the cereal was wholly responsible, and others still believe the disease to be caused by a specific organism. Recent observations in the Philippine Islands help to reconcile these views and to prove that the danger lies in the method of preparing the grain. According to available statistics, it would seem that beriberi has increased among the natives since the introduction of rice milling machinery. Not only in the Philippines, but in other parts of the Orient, an increase in the number of cases of this disease has been observed since polished rice has supplanted the hand-milled variety as a staple article of diet. Beriberi is more frequent among natives whose food is polished rice than among those in remote regions where the Filipino still uses the unpolished cereal, although rice continues to be the principal article of diet. De Hann has observed that beriberi could be kept in abeyance by adding to the white rice diet a form of green pea, rich in phosphorus, the "katchung idju." Frazier and Staunton at the Laboratory for Medical Research in Kuala Lumpur of the Malay States found that fowls fed on highly polished rice suffer from an inflammatory disease of the nerves, probably identical with beriberi in human beings. Frazier points out that in a steady diet of polished rice, the peripheral nerves do not obtain sufficient nourishment. The unpolished rice grain contains beneath the skin or pericarp a layer of cells rich in fat and phosphorus, while the central portion of the grain consists of pure starch. In polishing rice, the outer fat-containing layer is removed. Rice prepared in the ordinary native way by hand milling contains a large amount of these oil-bearing layers. It is the experience of the Bureau of Health of the Philippine Islands that a little meat or even the rice polishings mixed with a diet of white rice will lead to improvement in beriberi patients in the early stages of the disease. Polished rice is no longer used as a diet in either the Army, the Navy, or in the public institutions of the Islands.

**BERKELEY, CAL.** See INITIATIVE AND REFERENDUM.

**BERLIN.** See GERMANY.

**BERLIN, UNIVERSITY OF.** See UNIVERSITIES AND COLLEGES.

**BERMUDA.** A British colony, composed of over 300 small islands, 580 miles east of North

Carolina and 677 from New York. Total area, about 19 square miles. About 20 of the islands are inhabited. Total population (1901), 17,535 (6383 whites); 1909, 19,434 (6777 whites). Birth-rate (1907), 36.8; death-rate, 19.9 per thousand; marriages, 185. There were in 1909 49 primary schools (26 receiving government aid of £1611 annually, with 1959 pupils, 18 unaided, 3 garrison, 2 naval), and 6 secondary schools. Chief town, Hamilton, with (1901) 2246 inhabitants. Area cultivated in 1901, 2652 acres. Onions, potatoes, and other vegetables, lily bulbs, and arrowroot are grown. Imports for 1909 were valued at £440,648 (cattle £22,045; food stuffs, £21,511; cotton goods, £20,191; flour, £19,413; butter, £15,474. Exports, £183,884 (potatoes, £37,508; onions, £26,375; vegetables, £13,375; lily bulbs, £6805). There are no telegraphs; there are 214 miles of military, and 1200 miles of private telephone lines. The colony is connected by cable with Halifax, Nova Scotia, Turks Island and Jamaica. There are 19 post-offices, and two local banks. Revenue and expenditure (1909), £68,921 and £67,003 respectively. Public debt, £45,500. The governor of the colony (1910, Lieut.-General Walter Kitchener) is also commander-in-chief of the military forces.

**BERNARD, TRISTAN.** See FRENCH LITERATURE.

**BERNE-BELLECOUR, ÉTIENNE PROSPER.** A French landscape, portrait and military painter, died November 29, 1910. He was born in Boulogne in 1838. He was the pupil of Picot and Barrias, and at first painted landscapes and portraits. His reputation was, however, achieved by the accurate and spirited pictures of episodes of the Franco-Prussian War. His works, many of which are in private collections in the United States, include the following: "Cannon Shot" (1872), "In the Trenches" (1877), and "To Arms!" (1891).

**BHUTAN.** A semi-independent state in the eastern Himalayas. Area, about 20,000 square miles; population, mainly Buddhists, about 250,000. Capital, Punakha. The chief products and exports are rice and other grains, wax, musk, ponies, chowries, and silk. The imports from Bengal, Eastern Bengal, and Assam (1908-9) amounted to £38,556 (1907-8, £40,284); exports to those provinces, £20,148 (£22,975). In 1910 a treaty was concluded by which the Indian government assumed control of Bhutan's foreign relations, and agreed to pay the maharajah an annual subsidy of £6667 and to refrain from interference in internal affairs. The former dual control by a secular and a religious head was abolished in 1907, when the temporal chief (*tongsa penlop*), Sir Ugyen Wangchuk, was elected sole ruler. Political officer (1910), C. A. Bell.

**BIBLE SOCIETY, AMERICAN.** A religious organization founded in 1816 for the purpose of encouraging a wider circulation of the Holy Scriptures, without note or comment. The year 1910, the 94th of its existence, was one of the

most notable years in the history of the Society. During the year the campaign to secure \$500,000, upon which was conditioned an equal amount to be given by Mrs. Russell Sage, was satisfactorily completed. There came also during the year the announcement of the legacy of Mr. John S. Kennedy of \$750,000 for the general work of the Society. Most important for its influence on the distribution of Bibles in the United States was the action of the Pennsylvania Bible Society, the oldest society of its kind in America, in entering into coöperation with the American Bible Society to create a great home agency covering the States of Pennsylvania, Delaware and New Jersey. With the exception of Maryland and the New England States the entire country is now covered by the direct and systematic efforts of the National Society. The year was also memorable for the large increase in the issues of the Society. The total issues of the Bible House in New York during the year ending March 31, 1910, was 984,325 volumes in the English language. This total is made up of 213,740 Bibles, 291,163 Testaments and Testaments and Psalms, 478,443 Portions and 979 volumes in the various raised characters for the blind. In addition to these issues in the English language, the Scriptures were issued in 70 languages other than English. Of these the largest number were in the Spanish language, 141,285. In Italian, 73,853 volumes were issued; in Portuguese, 41,064; in German, 33,837; and in Polish, 32,296. There were printed and purchased abroad for foreign distribution 1,399,584 volumes, including Bibles, Testaments and Portions, and there were sent abroad for distribution 203,013 volumes, making the total number for foreign circulation 1,602,597, and the total number published by the American Bible Society for distribution throughout the world, 2,826,831 volumes. The total issues of the Society in 94 years amount to 87,296,182. China showed a great advance in the number of volumes issued during the year. The total number issued for that country was 1,028,496 volumes, an increase of 532,477 volumes over the previous year. The total receipts of the Society during the year 1909-10 amounted to \$533,470. This does not include the trust funds, of which only the income can be used. The amount received in legacies during the year was \$187,739 and there were received from church collections \$24,433. The work among the different agencies in the United States prospered during the year. These include the Agency among the Colored People of the South, the Northwestern Agency, the South Atlantic Agency, the Western Agency, the Southwestern Agency, the Pacific Agency, the Eastern or Central Agency, and the Atlantic Agency. Among the colored people 27,976 Bibles were distributed during the year. Among the foreign agencies notable work was done in China, where the circulation is referred to above, and in Korea, where 70,187 volumes were distributed. In the Philippines 72,543 volumes were distributed, and in Japan, 61,045. Important work was also carried on in Porto Rico, Mexico and Central America. During the year the Society lost by death three of its vice-presidents, Major-General Oliver O. Howard, Professor James H. Carlisle and Justice David J. Brewer. Bishop Daniel A. Goodsell, who died during the year, was also a member of the Society and deeply concerned in its work. On May

6, 1909, the Board of Managers elected Theophilus Anthony Brouwer as its thirteenth president. He was elected to succeed Daniel Coit Gilman, who died in 1908. The Secretaries of the Society are Rev. John Fox, D. D., Rev. William I. Haven, D. D., and Rev. Henry Otis Wright, LL. D., and the Treasurer is William Foulke.

**BICYCLING.** See CYCLING.

**BIERBAUM, OTTO JULIUS.** A German author, died 1910. He was born at Grünberg, Lower Silesia in 1865. He successfully took up the studies of philosophy, Romanic philology, history of art, and Oriental languages. In the course of his studies he visited the universities of Zurich, Leipzig, Munich and Berlin. He became in 1892 the editor of the *Freie Bühne* of Berlin, later published as the *Neue Deutsche Rundschau*. He abandoned the publication of this journal to found the art journal *Pan*, which he conducted in 1895 in collaboration with Julius Meyer-Graefe. His publications include: *Erlebte Gedichte* (1892); *Studentenbeichten* (1897); *Die Freiersfahrten und Freiersmeinungen des veierfeindlichen Herrn Pankrazius Graunzer* (1897); *Der bunte Vogel von 1897 und 1899*; *Ein Kalenderbuch* (1896 and 1898); *Irrgarten der Liebe* (1901), a collection of poems; *Stella und Antonie*, a drama (1903); *Eine empfindsame Reise im Automobil* (1903); *Das Cénacle der Maulesel* and *Die Schlangendame*, plays (1905).

**BIGELOW, JOHN.** See LITERATURE, ENGLISH AND AMERICAN, section *History*.

**BILHARZIA.** See TROPICAL DISEASES.

**BILLIARDS AND POOL.** The billiard history of 1910 is noteworthy for the growth in popularity of the three-cushion game. Alfredo de Oro of New York City began the year as title-holder, but met defeat at the hands of Fred Eames of Denver in January. Two months later Thomas Hueston wrested the prize from Eames and in May de Oro defeated Hueston. The overthrow of de Oro followed in December when he lost to John Daly. Calvin Demarest, who was the 18.2 balkline champion at the beginning of the year, was beaten by Harry Cline in February. The latter in turn went down to defeat before Willie Hoppe, who had made his peace with the controlling powers of the game, after having been for several months on the outs with them. Then Hoppe won the 18.1 title from George Sutton. The veteran, George Slosson, next challenged Hoppe, only to receive one of the worst beatings of his career. This left the young billiard wonder supreme in the field. Hoppe made several new records during the year, but the majority of them were not officially recognized. In the three-cushion game George Moore made a run of 15. The old mark, 14, was made by Frank Peterson, an amateur, twenty-five years ago. The amateur championship was won by E. W. Gardner, who did not lose a game. J. F. Poggenburg carried off the special prize for the highest single average and Joseph Mayer captured the high run trophy. Jacob Schaefer, "The Wizard," one of the finest exponents of the game, died during the year.

The championship in continuous pool changed hands three times in 1910. Thomas Hueston, who started the year as title-holder, was defeated in January by Jerome R. Keogh, who retained the championship by successive victories over Charles Weston, Clarence Safford, and Ben-

jamin F. Allen, until in November he lost it to Alfredo de Oro.

**BINET-VALMER.** See FRENCH LITERATURE.

**BIOCHEMISTRY.** See BOTANY.

**BIOGRAPHY.** See FRENCH, LITERATURE; GERMAN LITERATURE; and LITERATURE, ENGLISH AND AMERICAN.

**BIOLOGICAL STATIONS.** On the Atlantic coast of North America, the laboratory of Tuft's College, at South Harpswell, Me., the Marine Biological Laboratory at Woods Hole, Mass., the laboratory of the Brooklyn Institute at Cold Spring Harbor, the Harvard laboratory at Bermuda, the United States Fisheries laboratories at Woods Hole and Beaufort, N. C., and the Marine laboratory of the Carnegie Institution at the Dry Tortugas, were conducted as in previous years. (See YEAR BOOK for 1909.) In addition to these the Johns Hopkins University established a summer laboratory at Montego Bay, Jamaica, thus reviving a project which had been dormant since 1897. According to the report of the Director, Professor Andrews, the locality seems to have been exceptionally favorable, both as to climatic conditions, and as to the available forms of life. The laboratory was primarily conducted for the benefit of the graduated students of the University. The United States Fisheries Bureau laboratory at Fairport, Iowa, completed its organization, and with Dr. R. E. Coker as Director began propagation work on mussels. The universities of Michigan and of Colorado conducted as usual, summer laboratories, while on the Pacific coast marine laboratories were maintained by the University of Washington, University of California, University of Lower California, and the Leland Stanford University. All of these were for both instruction and research. The Port Erin Biological Station reported extended work on oceanography and fish hatching. Extensive additions are to be made to the buildings of this station, to accommodate the increasing number of students and investigators. For an exhaustive study of the European Biological stations by Professor C. A. Kofoid, see Bulletin No. 4, 1910, U. S. Bureau of Education.

**BIOLOGY.** As indicated in the YEAR BOOK for 1909, there is, at the present day, not only a very great lack of agreement as to the value of the results reached by different workers along lines of investigation in Heredity and Evolution, but an unfortunate disagreement as to the best methods to be employed in the solution of these problems. What follows is a summary of the most important work of 1910 along these lines, but no attempt has been made at harmonizing the apparently discrepant results.

General topics, as Heredity, Evolution, etc., are treated in this article; for general morphology of animals, see article ZOOLOGY; for plants, see BOTANY. Special articles dealing with insects, fishes and birds will be found under the headings ENTOMOLOGY, FISH AND FISHERIES, and ORNITHOLOGY respectively.

**BIOMETRICS.** The application of mathematical methods to the study of biological data (biometrics) has apparently not accomplished the results that were hoped for it, so that Bateson, in his *Mendel's Principles of Heredity* (see YEAR BOOK for 1909), said: "That such work may ultimately contribute to the development of statistical theory cannot be denied, but as applied to the problems of heredity the effort has

resulted only in the concealment of that order which it was ostensibly undertaken to reveal. To those who hereafter may study this episode in the history of biological science it will appear inexplicable that work so unsound in construction should have been respectfully received by the scientific world." To this, Pearson, the leading English biometrician, replies in *Biometrika*, 1910, that "Biology has now developed theories of such complexity that without the aid of the highest mathematical analysis it is wholly unable to state whether its theories are accurate or not. This many Mendelians admit to-day and all will admit it in the near future." It is however, true that so far as it is possible to form a judgment concerning the permanent value of the work of a contemporary, the investigators whose work now seems of greatest value do not agree with Pearson in either his methods of work or the conclusions derived from them. Pearson also combats the conclusions reached by Jennings, Johanssen and others in the study of the so-called "pure lines of descent" (see YEAB BOOK for 1909). He thinks, for example, that a proper mathematical treatment of Jennings results on inheritance in *Paramecium* would show that he really did secure a modification when breeding in pure lines. Pearson also discussed data given by Hanel on the selection of *Hydra* according to the number of tentacles, and claimed that the data showed that here selection in a pure line had actually led to a permanent increase in the number of tentacles. Pearl and Surface, however, reached conclusions more in agreement with those of other workers in their study of the egg laying power of hens, for they found that the progeny of especially prolific hens, laying 200 and more eggs a year, were no more prolific than those of hens with a much lower record. This is in substantial agreement with the results reached as a matter of experience by practical breeders, who for years have stated that in estimating the value of an individual for breeding purposes, it is necessary to consider not only its individual capacities but whether or not it is able to transmit them to its descendants.

**GENETICS.** Interest is increasing in the general subject of Genetics, and a new journal, the *Journal of Genetics*, under the editorship of Bateson and Punnett, was announced in 1910. Interest centres mainly around the applications and extensions of the law of Mendel, though much interest was being shown in the subject of eugenics, which has an immediate and practical application to some problems of human society. A special Eugenics Committee of the American Breeders' Association was appointed in 1909, and a report by its Secretary, Dr. Davenport, appeared in 1910. While but little could be reported as actually accomplished up to that date, the report shows that enormous actual saving to the community could be brought about by investigations in eugenics, and practical application of the results of these investigations.

**GALTONISM AND MENDELISM.** In dealing with Mendel's Law, Davenport maintains the paradoxical conclusion that a character may really be dominant and still not appear (reversal of dominance). This he thinks may be due to the fact that the really dominant character may be weakened or it may appear late in the ontogeny, so as not to be in evidence in early stages. According to the pioneer work of Galton on heredity, the character of the offspring is inter-

mediate between those of the parents (blended inheritance); while in cases which are typically Mendelian, the offspring, with respect to any one pair of opposed characters, each possessed by one parent, will inherit either one or the other, and not a blend of the two. Thus a distinction is made between variations which are continuous, leading to a blended inheritance, and those which are discontinuous, leading to a Mendelian form of inheritance. Many students of heredity have believed that this distinction is unreal, and that, properly analyzed, the continuous variations would be seen really to belong in the other group, thus making all inheritance of the Mendelian type. Castle says that size variations are apparently continuous and their inheritance blending, while color variations are discontinuous and their inheritance Mendelian. Castle does not attempt to reconcile these differences, but suggests that they can be reconciled by supposing that there may be a number of allelomorphic pairs, not alike in ultimate constitution, but when active capable of producing the same results: for example, as in the case of East's own work on inheritance in maize, a red seed color. Here red, not necessarily always of the same shade, may be produced by any one of a number of allelomorphic pairs, in each of which the color is dominant to its own absence. The intensity of the color would depend on the number of these characters present, and we might therefore get apparent continuity when we really have variable numbers of individually discontinuous characters.

**CHROMOSOMES.** Wilson, Stevens, and others, continued their study of chromosomes, and Guyer found in human spermatogenesis evidence bearing on Wilson's contention that the determination of sex is in some way connected with the accessory chromosomes. He finds in the spermatogonia twenty-two chromosomes, of which two are evidently accessory, since half of the spermatids contain ten, and half twelve chromosomes. Arguing from analogy, he thought that in the human male, the body cells have twenty-two, and in the female, twenty-four chromosomes. Newmann and Patterson found thirty-one and thirty-two chromosomes respectively in the male and female armadillo. Montgomery, on the other hand, after reviewing the evidence for regarding the chromosomes as determiners of sex, concludes that it assumes too definitely limited a function for the chromosomes. Sexuality, like other bodily characters, is, he thinks, a result of the total bodily compositions, not under the control of one or a few chromosomes.

**UNIT CHARACTERS.** There was manifested during the year an increasing amount of scepticism concerning the accuracy of that part of deVries's theory of inheritance dealing with unit characters, these seeming to many workers too fixed and unchangeable, allowing as they do of change only through mosaic arrangement and rearrangement, to accord with the observed facts of heredity. Tower asked if the unit characters or lesser entities occupy in the organism the mosaic relation and have the capacity for the mosaic rearrangement claimed by most Mendelians, and from a study of the results of his own extended researches on *Leptinotarsa* concludes that they do not. Crossings between species of this genus show that external conditions as temperature and moisture determine whether one character shall be dominant or recessive, or

whether the offspring may be a hybrid. From this he concludes that we must not regard the hereditary characteristics of the living body as due to paired determinants more or less isolated from other determinants in the body, but to the organic substance of which the body is composed, taken as a whole, the whole being affected and more or less modified by external factors. Spillman showed that we might have true Mendelian phenomena without assuming unit characters, on the hypothesis that the character of a cell may be of one or another sort, according to the relative amount of chemical changes going on in it. Thus color may be due to the action of an enzyme on a chromogen. If the relative amounts of the two substances vary, we get color variations. We may get, for example, red or white, not because of a red unit opposed to, or replacing a white, but because the enzyme action on the chromogen may give either red or white dependent on the relative amounts of the two substances present.

**COLOR VARIATIONS.** Mr. and Mrs. Davenport continued their study of heredity in a paper on the heredity of Skin Color in Man, using data obtained from a study of crossings between the negro and white races. Their general conclusion was that skin pigmentation in crosses between the two races is not a typical blend, but that the original grades of dark and light coloration segregate in the germ cells. Johnson, in a publication of the Carnegie Institution on the "Evolution in Color Pattern of Lady Beetles," concluded that color variations are both continuous and discontinuous; that the pattern is capable of being modified by the environment; some of these modifications being inherited, others not; that Jordan's law in evolution (New species arise only through isolation) is not followed, since species overlap to a great extent, and that natural selection, if active at all, is principally *conservative* of the color pattern. He thought that there was a form of determinate variation largely actuated by the effect of the environment on the germ plasma which was accomplishing a marked evolution of the color pattern.

That evolution has progressed in definite lines without the selection of chance variations is claimed by Morgan, who thinks that this is due to the fact that organisms respond to environmental conditions, and that each response in a definite direction tends so to modify the protoplasm that it may respond more readily to later stimulus in the same direction. Clark, in Ophiuroids, showed that closely related species occur in the same locality, thus in contradiction to Jordan's law. He thought that some form of physiological selection was responsible for the change of species in this case.

**TRANSMISSION OF ARTIFICIAL MODIFICATIONS.** Sumner tested the question whether artificially produced modifications in an animal tend to reappear in the offspring, by a series of observations on mice. A number of individuals kept in a warm room were found to differ from those kept in the cold in a number of characters, the "warm room" mice having on the whole longer tails, feet and ears than the "cold room." Mice living under these conditions were removed as soon as they became pregnant to a common room, so that their offspring were born and reared under precisely similar temperature conditions. The offspring showed, with some exceptions, though to a less degree, the same dif-

ferences as those which characterized their parents. Since in a warm-blooded animal the germ plasma could not be affected by the temperature of the atmosphere outside the body, it looked as if there might have been a direct inheritance of bodily modifications. This conclusion is suggested in a very tentative way by Sumner, who recognized that other interpretations are possible, and proposed to continue his results further.

**PARASITIC CASTRATION.** Wheeler studied the effects of parasitic castration in *Polistes metricus* parasitized by *Xenos*. This condition is a frequent one, 1000 specimens of *Polistes* from western Connecticut showing more than 25 per cent. of infection. The only visible effect of the parasite on the host was a slight color change, secondary sex characters not being affected, thus a very different result from what happens in crustacea and vertebrates. Wheeler concludes from a general survey of the effects of various forms of castration in insects that "primary and secondary sex characters are very loosely correlated during ontogenetic development, or in a very different manner from what they are in vertebrates or even in crustacea. . . . The insect egg not only has its primary sexual characters determined long before fertilization, and independently of the later nuclear or chromosomal phenomena, but even the secondary sexual characters are in some manner also predetermined at this early stage." **BISMARCK ARCHIPELAGO.** A German protectorate under the administration of German New Guinea. Estimated area (with German Solomon Islands), 22,000 square miles; estimated population, 250,000. In 1906 estimated native population, 188,000; Chinese, 299. Whites in 1909, 474. There are Wesleyan and Catholic missions. A total of 13,464 hectares is reported under cultivation, the chief products being copra, cotton, coffee, and rubber. Imports (1908), 2,385,144 marks; exports, 1,426,212 (copra, 1,343,544); 555 vessels of 412,474 tons net entered and cleared. See ANTHROPOLOGY AND ETHNOLOGY.

**BJÖRNSON, BJÖRNSTJERNE.** A Norwegian poet, dramatist and novelist, died April 26, 1910. He was born at Kvikne in 1832, the son of a Lutheran pastor. His childhood was passed in Kvikne, Romsdal, and Molde, in noble scenery, rich in legendary associations. He studied at the University of Christiania, but left before graduation to work as a journalist, having already written sketches and reviews of plays. In 1857 he published his first drama, *Between the Battles*, and in the following year his first novel, *Synnöre Solbakken*, translated into English as *Trust and Trial*. He was made director of the theatre in Bergen and from 1860 to 1863 traveled on a government stipend, chiefly in Italy. After the latter year he resided, for the most part, in Norway, with frequent visits to Paris,

**BJÖRNSTJERNE BJÖRNSON**

1701

Rome and Munich. He lectured in the United States in the winter of 1880-81. His chief fame was as a novelist and dramatist, but he wrote ballads and lyrical compositions of great beauty. His dramas covered questions of politics and religion, domestic relations and social conditions. His great work was completed many years before his death and, therefore, for a long period he has been known and thought of as one of the great men of the Scandinavian lands. In early life he was an intimate friend of Ibsen, but they drifted so far apart as to be almost enemies. Fifteen years previous to Björnson's death, however, there was a reconciliation and his eldest daughter married Ibsen's son. He was a great champion of his race, of the Norwegian genius and of the restoration of the native tongue in its integrity. He organized public lectures in furtherance of Norwegian art. In his early years he accepted the theological views of elementary Christianity, but after a tour of study in foreign countries and after he had acquainted himself with the thought of Darwin, Spencer, Mill, Taine and others, through their works, his writings took a Darwinian and psychological tinge and he entered politics as a social reformer. He became prominent in the election campaigns and was eloquent in addressing the people. In 1870 he advocated the union of Norway with France. Later he led the National Radical party and at one time wished Norway to become an independent republic. In all his works, whether rural novels, heroic drama, plays or songs, the elements of grandeur, beauty and charm are present. Many of his plays deal with social problems. In *A Glove* he spoke for equality of standards in the morals of the sexes, while in *The Editor* he satirized the press and in *The King* attacked the institution of monarchy. He exposed the lack of honor in the financial world in *The Banker*. In 1903 he received the Nobel prize for literature. He was the chief novelist, probably the chief poet, and, with Ibsen, the chief dramatist of his country's history. His shorter poems were published in *Poems and Ballads* (1870), and in the same year appeared his only epic poem, *Arnljot Gelline*. From that time he wrote little verse. His early novels include *Arne* (1858); *A Happy Boy* (1860), and *The Fisher Maiden* (1868). These deal with rural life and are primitive pastorals, genuine yet modern. The dramas of the earlier years are based on the native sagas, with the exception of *Mary Stuart in Scotland* (1864) and *The Newly Wedded Pair* (1866). The drama of his second period began with *The Editor* (1874) and included *A Bankruptcy* (1875); *The King* (1877); *Leonardo* (1879); *The New System* (1879); *A Glove* (1883); *Beyond our Strength* (1883); *Geography and Lore* (1885); *Paul Lange and Tora Parsberg* (1898); *Laboremus* (1901); *At Storhove* (1903); and *Dagelannet* (1904). His novels show the same evolution from *The Bridal March* (1873) through *Magnhild* (1877), *Captain Mansana* (1879), and *Dust* (1882), to the true problem novels *The Heritage of the Kurts* (1884) and *In God's Way* (1889), the former dealing with redemption from heredity through education and the latter with bigotry and liberal thought. This brought on Björnson severe criticism from the orthodox, although his avowed aim was to exalt and purify religion. Many of his novels were translated into English.

**BLACK FLIES.** See ENTOMOLOGY.

**BLACKFOOT INDIANS.** See ANTHROPOLOGY AND ETHNOLOGY.

**BLACKWELL, ELIZABETH.** The first woman to receive a medical degree in the United States, died June 1, 1910. She was born in Bristol, Eng., in 1821, daughter of Samuel Blackwell, who emigrated to America with his family in 1832. He was a sugar refiner and established a refinery which, in 1838, was burned. He moved to Cincinnati, hoping to introduce there the cultivation of beet sugar and so strike a blow at slavery by making the Southern cane sugar plantations unprofitable. His plans were interrupted by death and he left his family dependent upon their own exertions. Elizabeth Blackwell, with the help of her mother and two sisters, opened a school and began at once to take an active part in the anti-slavery and higher education of women movements. Miss Blackwell took charge of a district school in Henderson, Ky., where she was brought into direct contact with slavery. Her views on the subject made her position impossible and she resigned after teaching one term. She became impressed with the need for women physicians and at once began an attempt to secure a medical education. She found it impossible to obtain admission into a medical school and in 1845 began the study of medicine privately under Rev. John Dickson who kept a school in Asheville, N. C., where she was engaged as a teacher; and after studying anatomy under Dr. Allen in Philadelphia, she applied for admission to the four medical colleges of that city, all of which refused to admit her. The medical schools of New York City also refused to open their doors to a woman, but after repeated applications she was admitted to the medical school at Geneva, N. Y., where she graduated at the head of her class in 1849. She studied later with her sister Emily in Paris and London, and in the latter city formed friendships with Lady Byron and Florence Nightingale. In 1851 she returned to New York City and began to practice. It was then considered highly improper for a woman to be a doctor and she was ostracized, even having difficulty in renting office room. Her patients came slowly, and not being allowed to practice in the dispensaries, she started one of her own, with her sister Emily, who had received her degree in medicine from the Western Reserve University in 1854. This institution was called the New York Infirmary for Women and Children, and was the first hospital in this country to be conducted by women. Most of the patients were drawn from the very poor, but in time the institution became a flourishing one. At the outbreak of the Civil War Dr. Blackwell called a meeting to consider means to provide trained nurses for the army, and from this meeting grew the National Sanitary Aid Association. Mindful of her struggle to obtain a medical education, and there being still no medical college for women in the United States, she founded the Woman's Medical College of the New York Infirmary, which was afterwards merged with the Cornell Medical College when that institution opened its doors to women. In 1869 Dr. Blackwell returned to England and practiced in London and Hastings. She founded the National Health Society of London and assisted in founding the London School of Medicine for Women. In addition to lecturing on medical and educational topics she wrote many

books and pamphlets, among them *Moral Education of the Young*, *The Human Element in Sex*, *The Influence of Women in Medicine*, *Pioneer Work in Opening the Medical Profession to Women* and *The Physical Education of Girls*. She was the sister of Henry B. Blackwell, the famous abolitionist.

**BLACKWELL, EMILY.** An American physician, died September 8, 1910. She was born in Bristol, Eng., in 1826. She began a course of medical reading and dissection at Cincinnati College when she was twenty-two years of age. She was already proficient in Latin, German and French. She taught school and earned money enough to enable her to study medicine. In 1851 she was refused admission at the Geneva Medical School at which her sister Elizabeth (see above) had been allowed to study. She was refused at ten other schools. She finally succeeded in obtaining admission to the free hospital of Bellevue, N. Y., and after an interval was received by the Western Reserve University, where she finished her course. She studied at Edinburgh and attended the clinics and lectures of the greatest surgeons in Paris. She was associated with her sister in the foundation of hospitals and dispensaries, and the chief professional events of their lives were shared together.

**BLAKE, WILLIAM PHIPPS.** American geologist and mineralogist, died May 22, 1910. He was born in New York City in 1826, and graduated from the Yale Scientific School in 1852, a member of the first class of the newly instituted department which later became the Sheffield Scientific School. After his graduation he became, in 1853, the geologist and mineralogist of the United States Pacific Railroad expedition, and in 1859-60 was editor of a mining magazine. In 1862 he went to Japan as a geologist in the service of the Japanese government and returned in the following year and explored the Stickeen River in Alaska, reporting the result of his expedition to Secretary Seward. In 1864 he was appointed professor of mineralogy and geology in the College of California. He received the appointment in 1871 as geologist of the United States Commission to Santo Domingo and in 1876 was commissioner to the Centennial Exhibition. From 1894 to 1905 he was director of the School of Mines of the University of Arizona and from 1905 to the time of his death was professor emeritus. From 1898 he served as territorial geologist. He was a member of many American and foreign scientific societies. He was the author of *Geological Reconnaissance of California* (1885), *Silver Ores and Silver Mines*, *Tombstone and its Mines*, *Ceramic Art and Glass*, and *Life of Captain Jonathan M.* He also contributed many papers and reports on technical subjects to scientific journals.

**BLODGETT, RUFUS.** An American public official, formerly United States Senator from New Jersey, died October 3, 1910. He was born in Dorchester, N. H., in 1834, and received a

common school education. He learned the trade of machinist and engaged in railway business in New Jersey. From 1874 to 1884 he was superintendent of the New Jersey Southern Railroad and from 1884 was superintendent of the New York and Long Branch road. He was a member of the New Jersey legislature from 1878 to 1880 and was a delegate to the Democratic National conventions in 1880 and 1896. In 1887 he was elected United States Senator, serving until 1893. He was mayor of the city of Long Branch for five consecutive terms.

**BLUEBERRIES, DOMESTICATION OF.** See HORTICULTURE.

**BLUE GUM FIBRE.** See CHEMISTRY.

**BLUE HILL OBSERVATION.** See METEOROLOGY.

**BLUNT, RICHARD FREDERICK LEFEVRE.** A bishop of the Anglican Church, died January 23, 1910. He was born in Chelsea, Eng., in 1833, and was educated at the Merchant Taylors' School. He studied law but finally entered King's College, London, with a view to taking holy orders. He graduated in 1857 and became deacon the same year. He was ordained priest in 1858. In 1864 he was appointed to the benefice of Scarborough, which he held until 1905. He was appointed suffragan bishop of Hull in 1891.

**BLÜTHNER, JULIUS.** See NECROLOGY.

**BOGOTÁ, RIOTS IN.** See COLOMBIA.

**BOIS, JULES.** See FRENCH LITERATURE.

**BOKHARA.** A Russian vassal state in central Asia. Area, 83,000 square miles; population, about 1,250,000. Capital, Bokhara, with about 75,000 inhabitants; Karshi has 25,000; Khuzar, 10,000. The people are Mohammedans. Corn, fruit, silk, tobacco, hemp, and livestock (goats, sheep, horses, camels) are raised. Chief minerals, gold, salt, alum and sulphur. Imports from India: green tea (reported to average 1125 tons annually), indigo, textiles and drugs. Exports of raw silk to India are reported to average 34 tons yearly. Imports of spirituous liquors are forbidden by the ameer, except for use at the Russian embassy. The Russian Trans-Caspian Railway runs through Bokhara (about 186 miles). The city of Bokhara has telegraphic communication with Tashkent. The ameer, Sayid Abdul Ahad (born March 26, 1859; succeeded, 1885), died at the beginning of 1911; and was succeeded by his son, Sayid Mir Alim Khan (born 1880). The Russian political agent resides at Bokhara.

**BOILERS, REINFORCED CONCRETE SETTINGS.** In the construction of boiler settings, reinforced concrete as used instead of brick has proved not only a satisfactory substitute, but in many cases is found superior to it, provided, of course, the design is modified and the concrete made in the proportions to give best results under the conditions imposed for this kind of work. The setting should be built with double walls, 5 or 6 inches thick, with a 6-inch air space between. The concrete must be made in the proportion of cement 1, sand 2, and stone 4. It is important that a hard stone be used, trap-rock giving the best results for this purpose, as it makes the hardest, densest and highest heat-resisting concrete when used in the proportion above specified. No soft rock or limestone should ever be used, for, even though not directly exposed to the fire (fire-brick always being needed), any but the hardest rock will in time disintegrate from

prolonged exposure to the heat transmitted by even the thickest brick.

The trap-rock should be crushed to the size of  $\frac{1}{2}$  or  $\frac{3}{4}$  inch, not larger, and the sand must be sharp and clean. In a few cases, where trap-rock was not obtainable without prohibitive expense, cinders have been used, but are not so desirable as the stone.

As to reinforcement, round 7-16 inch steel set 6 inches apart horizontally as well as vertically gives good satisfaction. Frequently 3-8 inch steel is employed, in which case the rods must be placed 5 inches on centres, care being taken to keep the ends of these at least  $1\frac{1}{4}$  inch away from the fire side of the inside wall. Furthermore, the firebrick lining must be heavy, a  $9\frac{1}{2}$  inch lining being none too thick, and in the end more economical than the  $4\frac{1}{2}$  inch size often used with brick settings. The inner and outer walls must be bound together at intervals by carrying the reinforcement clear through from one to the other. In some constructions the space between the walls is divided by bulkheads or partitions to secure added strength.

**BOLIVIA.** An interior republic of South America. Sucre, the seat of the Supreme Court, is usually regarded as the capital; but the president resides at La Paz, and for a number of years the Congress has held its sessions there and the foreign diplomats are stationed in that city.

**AREA, POPULATION, ETC.** The country consists of eight departments and of two territorial divisions. The latter have been little explored. The total area is unknown, and estimates differ widely; one estimate is 473,560 square miles, another about 605,000, still another about 708,000. Consequently the number of inhabitants is not known with even approximate accuracy, but estimates of population vary less than those of area, since it is certain that vast territorial regions are very sparsely peopled. The census of 1900 showed 1,744,568 inhabitants, and the estimate of 1908, 2,267,935. About one-half the population is Indian, and probably not more than one-eighth pure white. The estimated population of La Paz in 1909 was 78,856; Cochabamba, Sucre, and Potosí have about 25,000 each; Santa Cruz and Oruro, upwards of 20,000. Primary instruction is free and nominally compulsory. In 1906 primary schools numbered 710, with 48,560 pupils. Some provisions are made for secondary and higher education. The state religion is Roman Catholicism.

**PRODUCTION AND COMMERCE.** Agriculture shows unsatisfactory development, although about 5,000,000 acres are said to be under cultivation. The crops include corn, rice, barley and potatoes; other products are cacao, cinchona, and coffee, but the vegetable product commercially most important is rubber. The country, however, depends mainly upon its mineral resources, which are abundant and widely distributed, tin, silver and copper being the leading ores. The annual gold production amounts to about \$349,000.

Imports and exports are reported as follows, in thousands of bolivianos:

	1906	1907	1908	1909
Imports .....	31,997	34,562	33,069	34,069
Exports .....	50,757	45,902	58,924	63,764

The principal imports are cotton and woolen textiles, provisions, machinery and hardware, and alcoholic beverages. The exports are largely products of the mine, and the most important is tin. Chief exports (1909): Tin, 38,659 metric tons, valued at 31,654,109 bolivianos; rubber, 3052 tons, 21,947,138 bolivianos; silver (in sulphids and minerals), 5,721,915 bolivianos; copper, 1,641,201; bismuth, 1,451,075. The most noteworthy change in the import trade of 1909 was the decrease of German and the increase of American imports. In 1908 and 1909 respectively imports from the United States were valued at 8,164,129 and 10,873,604 bolivianos; Great Britain, 6,588,459 and 7,894,344; Germany, 10,207,532 and 5,320,999. In American gold the value of imports from the United States in 1909 was about \$4,349,000, American statistics, however, show exports to Bolivia amounting to only \$895,838. The discrepancy is explained by the American custom of crediting a large part of the exports for Bolivia to the ports of entry in neighboring countries.

The tin industry shows a notable development in the last decade. The export is chiefly barilla, containing about 60 per cent. of metallic tin; only a small part of the output is bar tin. The export of barilla in 1900 was 16,234 metric tons; 1905, 27,689 tons; 1906, 29,373 tons; 1907, 27,677 tons; 1908, 29,938 tons; 1909, 35,566 tons.

**COMMUNICATIONS.** The length of Bolivian railways is reported at 804 kilometres (500 miles). There is rail communication from Guaqui, on Lake Titicaca, to La Paz, to Oruro, thence to the southwestern frontier, and thence in Chile to the port of Antofagasta. Branch lines are under construction from Oruro to Cochabamba, from Oyuni to Tupiza, and from Mulato to Potosí. A line also is under construction from the Chilean port Arica to La Paz. According to a recent official statement about 860 miles of railway are projected at a cost of over \$12,000,000.

The length of telegraph lines is reported at about 3100 miles (2390 owned by the government), with 124 offices. There are somewhat over 200 postoffices.

**FINANCE.** Complete and final figures of revenue and expenditure are not available. Estimated revenue and expenditure: 1908, 15,925,375 and 16,717,500 bolivianos respectively; 1909, 16,209,026 and 20,363,662; 1910, 13,540,000 and 13,887,435. The greater part of the revenue is derived from import and export duties. In 1907 the recognized internal debt amounted to 4,346,529 bolivianos, besides treasury bonds amounting to 2,500,000 bolivianos. The (J. P.) Morgan loan of \$500,000 (6,250,000 bolivianos), contracted in December, 1908, was applied for immediate service of the internal debt and to help in the establishment of the gold standard. The aggregate debt, on Jan. 1, 1910, is reported at 7,760,325 bolivianos. The monetary unit, the boliviano, is worth 38.93 cents (12.5 to the pound sterling).

**ARMY.** While compulsory military service is required of males between the ages of 20 and 50 the army is virtually a militia and consists of a brigade of infantry composed of 6 battalions of 4 companies with 300 men, two regiments of cavalry aggregating 600, 1 battery of field artillery with 4 guns, 1 regiment of mountain artillery with Creusot guns. The peace effective

of the army in 1910 was stated at 257 officers and about 3000 men. This number can be increased considerably by the various Columns or local troops in the chief towns of the various departments. Each of these amounts to between 40 and 100 men and in case of war they would be the skeletons for new battalions. There are also three batteries of artillery of old pattern that would be utilized by reserve forces. The army reserves and the territorial guard were estimated to produce a possible fighting strength of about 90,000 men upon mobilization. Progress was being made with the reorganization of the army which was designed to have an extra cavalry and an extra artillery regiment in addition to those mentioned.

**GOVERNMENT.** The executive authority is vested in a president, who is elected for a term of four years and is assisted by a ministry divided into six departments. The legislative power devolves upon a congress of two houses, the Senate (16 members) and the Chamber of Deputies (72). The President in 1910 was Eliodoro Villazón (for the term of 1909-13). **BOOTS AND SHOES.** Dr. H. W. Wiley, the chief chemist of the United States Department of Agriculture laid before Congress during the year evidence of the fraudulent "loading" of leather by the use of glucose and other materials which adds to the weight of the leather, but as it is soluble, causes the shoes to deteriorate rapidly when worn in the wet or snow. This fraud, according to Dr. Wiley, is practiced extensively with the cheaper grades of shoes and this question of the adulteration of sole leather became so prominent during the year that the following resolution was passed by the National Boot and Shoe Manufacturing Association.

"Relating to the subject of the adulteration of leather this Association desires to again enter its earnest protest against the continued adulteration of leather and the report of progress made by your committee warrants us in declaring the custom to be unnecessary, harmful and inherently wrong. Therefore be it

Resolved, That our committee be authorized to continue its investigation, confer with the representatives of the tanners, and to report to all members simple methods of detecting the presence of adulterating materials and in general to do all in its power to protect shoe manufacturers from the annoyance and loss resulting therefrom.

The year 1910 was a record year in the boot and shoe industry so far as exports were concerned. Both in quantity and value previous years were exceeded and the foreign trade, especially in Central and South America, was beginning to attain substantial dimensions.

Exports of Boots and Shoes:

	Pairs.	Value.
1910	7,810,903	\$13,216,237
1909	6,773,934	11,443,225
1908	5,967,793	10,031,227
1907	6,326,527	11,658,323

Cuba is the largest customer for American shoes, taking in 1910 2,848,304 pairs. Other countries to which shoes were exported, with the quantities, were Mexico 789,627 pairs. Canada 796,977, Central American States and British Honduras 525,781, West Indies and Bermuda 646,705, United Kingdom 752,176, and South America 335,164.

**BÖRJESON, JOHAN HELENUS LAURENTIUS.** A Swedish sculptor, died in February, 1910. He was born in Holland in 1835, and studied in Rome and Paris. In 1886 he was appointed professor in the Academy at Stockholm. His works include genre and ideal subjects, and portrait-statues of various sizes. The following are among the best known of his creations: "The Bowler" (Gothenburg Museum); "Youth with a Tortoise" (National Museum, Stockholm), and the colossal statues of Holberg at Bergen, and of King Charles X. at Malmö.

**BORNEO.** An East Indian island belonging partly to Great Britain, partly to the Netherlands. Estimated area, 293,500 square miles; estimated population, 1,680,000. See **BRITISH NORTH BORNEO; BRUNEI; SARAWAK; DUTCH EAST INDIES.**

**BORON.** See **ATOMIC WEIGHTS; FERTILIZERS.**

**BOSNIA AND HERZEGOVINA.** Since September 5, 1908, provinces of the Austro-Hungarian Empire (formerly Turkish provinces). Area 19,702 sq. miles. Population (1895), 1,568,092 (1908 estimate, 1,828,379); Mohammedans, 548,032; Oriental Orthodox, 673,246; Roman Catholic, 334,142. The population is mainly Croato-Servian. Capital and largest town, Sarajevo, with 38,083 (1908, 41,500) inhabitants; Mostar had 14,370 and Banjaluka, 13,566. Education (free but not compulsory) is furnished in 398 elementary, 940 lower and 93 reformed Mohammedan schools, 5 *gymnasias*, 2 *realschule*, 11 advanced female seminaries, and 9 commercial schools. Theological and normal (3) colleges and technical and industrial schools exist.

About 88 per cent. of the people are engaged in agriculture which, despite the fertile soil, is not in a high state of development. The staple grains are raised, as well as tobacco (a government monopoly), potatoes, flax, hemp, and fruit. Of the total area 55 per cent. is forest. Cattle and sheep raising is carried on. At the last census there were 233,322 horses, 1,416,394 cattle, 3,230,720 sheep, 1,447,049 goats, and 662,242 swine. Minerals abound, and mining is carried on mainly by the government; miners employed 3172. Output of coal (1908), 659,962 tons; iron ore 149,887; manganese, 6900. Output of metals: raw iron, 51,652 tons (valued at 3,038,400 kroners); wrought iron, 27,185 (5,222,219 kroners); cast iron goods, 4613 (995,838 kroners). Output of Dolina Tuzla salt works, 19,382 tons (2,190,155 kronen). Bosnia and Herzegovina belong to the Austro-Hungarian customs territory. Imports in 1908 (estimated), consisting mainly of cotton textiles, cereals, flour, clothing, etc., 121,686,385 kronen; exports, 108,951,274 (tobacco, 1,155,861 kronen; dried plums and marmalade, 7,250,949; timber,

30,811,533). The number of cattle exported was 69,213; horses, 13,423; sheep, 122,054; goats, 58,039. Length of railway lines (1909), 984 miles; telegraph lines and wires, 1910 and 3820 miles respectively; telephone lines and wires, 183 and 718; post offices, 137. Revenue and expenditure for 1908, 66,487,959 and 66,482,018 kronen respectively; estimated for 1909, 71,320,483 and 71,299,013. The new constitution was proclaimed February 20, 1910. The two provinces are administered through the Austro-Hungarian Minister of Finance (in 1910, Baron Stephan Burján a Rajecz).

**BOSTON.** See CONGESTION OF POPULATION, and MASSACHUSETTS.

**BOSTON, SCHOOLS IN.** See EDUCATION IN THE UNITED STATES.

**BOSTON SYMPHONY ORCHESTRA.** See MUSIC.

**BOTANY.** CHANGES AND PROGRESS IN 1910. Judged by its literature, the year 1910 was an active one in the several fields of botany. One of the important events of the year was the holding of the Third International Congress at Brussels, May 14 to 22, which was attended by about 150 delegates from all parts of the world. As the previous congress at Vienna had legislated on the subject of the nomenclature of the higher plants, that at Brussels considered the initial dates for the nomenclature of cellular cryptogams. The botanical section of the British Society for the Advancement of Science met at Sheffield, England, August 31 to September 7, 1910, with Prof. J. W. H. Trail as vice-president. At this meeting joint sessions were held with the sections of chemistry and physiology to consider the biochemistry of respiration, and with the section of zoology to discuss the problems of cytology. The botanical section of the American Association for the Advancement of Science met at Minneapolis, Minn., December 27 to 31, 1910, with Dr. R. A. Harper, of the University of Wisconsin, as vice-president. The Botanical Society of America and the American Phytopathological Society met at the same time and place. The American Society of Naturalists and the Society of American Bacteriologists met at Ithaca, N. Y., at the same time.

A number of prominent botanists died during 1910, among them Dr. C. R. Barnes, professor of plant physiology of Chicago University; Dr. M. Trueb, for many years director of the botanical garden at Buitenzorg, Java, and noted for his work on the rôle of hydrocyanic acid in plants; Dr. C. B. Plowright, the English mycologist; Prof. C. F. Wheeler, for 10 years assistant botanist of Michigan Agricultural College and later with the U. S. Department of Agriculture; Émile Bréal, known for his early work on the function of the root tubercles of leguminous plants; F. Renault, the French bryologist; Prof. D. P. Penhallow, the paleobotanist and professor of botany at McGill University, Montreal, and Prof. J. B. Carruthers, well known for his investigations on the diseases of cacao, rubber, and other tropical plants. A number of important changes were made during the year. Dr. W. J. Beal, for 40 years botanist of Michigan Agricultural College, retired and was succeeded by Dr. E. A. Bessey; Dr. W. J. V. Osterhout succeeded Dr. G. L. Goodale, who retired after 30 years as professor of botany at Harvard; Dr. L. R. Jones, of the University of Vermont, went to the University of Wisconsin and was succeeded by Dr. G. P. Burns, of Ann

Arbor, Michigan; Prof. W. G. Gallagher, botanist and director of agriculture of the Federated Malay States, retired and was succeeded by Dr. Lewton Brain, formerly mycologist of the British West Indies and later of the Hawaiian Sugar Planters' Experiment Station. Dr. B. E. Livingston has been appointed professor of plant physiology at Johns Hopkins University; Dr. J. E. Kirkwood, professor of botany and forestry at the University of Montana; and Dr. C. Stuart Gager, director of the newly established botanic garden in Brooklyn, N. Y. During the summer a monument was erected to the memory of Gregor Mendel at Brunn, where he carried on his experiments in plant breeding that led to the formulation of the now famous Mendel's laws of inheritance.

The *Botanical Journal* made its appearance as the official organ of the Royal Botanic Society of London. Three new periodicals of interest to plant breeders were started. The *Mendel Journal* and the *Journal of Genetics* in London and the *American Breeders' Magazine* of Washington, D. C.

Taxonomic botany was enriched during the year by a great number of papers descriptive of new species of plants, distribution of species, monographic studies of genera, etc. Uphof in *Die Pflanzengattungen* tabulates the number of species of flowering plants and ferns, and the data now in hand places the total number of species of plants at about 233,000. In the special fields of ecology, morphology, and cytology a number of important contributions appeared, while the activity in plant breeding, physiology, and pathology equaled that of any like period.

**PLANT BREEDING.** The sixth meeting of the American Breeders' Association was held at Omaha, Neb., December 5-7, 1909, at which time the progress in plant and animal breeding was reviewed. In order to have a proper basis for plant breeding it is often desirable to know the original species from which economic plants have been derived, and Aaronsohn reports finding in Palestine a wild species of *Triticum* from which our wheat is believed to have originated. A number of European botanists have studied the wild and cultivated species of *Solanum* to find if possible the original of the common potato. There have been a number of contributions to the physiology and cytology of heredity. Balls found from a cytological study of cotton hybrids that there are a large number of allelomorphic pairs of characters that conform to Mendel's law. Leclerc du Sablon claims the *Oenothera lamarckiana* is a hybrid, and that the mutations of de Vries are the result of the hybridization of the plant, the seedlings segregating according to the Mendelian theory. East has studied the possibilities of producing new varieties of potatoes by asexual reproduction and finds nothing in his results to commend the practice to commercial purposes. Shull has continued his studies on color inheritance in *Lychnis*, and Cook has called attention to the mutative variations in cotton, especially in the Egyptian races where ancestral characters suddenly appear in new or unfavorable environments. Cannon reports studies on heredity in species and hybrids of walnuts, poppies, evening primroses, and potatoes, and Waugh and Shaw on variation in sweet peas. Love has shown that the characters of height, yield, and number of internodes in peas vary with food supply.

Emerson finds the characters of size and shape in maize, squashes, gourds, and beans blend in the  $F_1$  generation and segregate in the  $F_2$ . Leclerc and Leavitt found wheat exhibited the same characters when constantly grown in a given locality, but marked differences appeared with a change in environment. Mann found the same with barley. A considerable number of studies on correlation characters in plant breeding were reported within the year; among them Waldron reported on correlations in oats and Clark in timothy. See also HORTICULTURE.

**PLANT PHYSIOLOGY.** The constitution and function of chlorophyll continue to attract the attention of investigators. Stahl, Willstätter, and others have continued their studies on the chemistry and biology of chlorophyll. Issatchenko found chlorophyll formation could take place at as low a temperature as  $-8^{\circ}\text{C}$ . Brdlik claims that phosphorus is necessary for the physiological activity of chlorophyll. As contributing to carbohydrate synthesis, Berthelot and Gaudechon have proved the synthesis of formaldehyde from carbon dioxide and water, under the action of ultraviolet rays. Lubimenko has found light essential for the beginning of the development of fruits, after which growth can proceed in the dark, but with a lowered dry weight. Combes reports that strong light induces an accumulation of elaborated materials in storage organs, while diffused light tends to the utilization of nutritive materials and promotes vegetative growth. Thatcher claims that shading plants increases their moisture, ash, and nitrogen content and diminishes the starch and other carbohydrates. The ascent of sap has had much study, and a number of papers showing that it is due to vital functions have appeared. The formation, translocation, and storage of nitrogenous materials in plants have been investigated by a number of physiologists, and Flammario finds nitrogen in plants increases most rapidly under those colors that stimulate chlorophyll functions the least. André claims that the source of nitrogen in the metabolism of plants must be found in some other form than the nitrates of the soil. Trueb has reviewed his earlier work and found nothing to change his view that hydrocyanic acid is the first organic nitrogenous compound formed by plants. Greshoff and others report cyanogenetic glucosids abundant in plants of nearly every botanical family. Bottomley found by an association of *Pseudomonas* and *Azotobacter* leguminous plants absorb greater quantities of nitrogen than when either acts alone, and De Rossi claims that the true cause of nitrogen assimilation is not *Pseudomonas radicola* of Beijerinck but an organism hitherto overlooked. In nitrogen fixation by bacteria Koch claims that some form of cellulose in the soil is necessary for the energy of fixation. A large number of studies on the effect of chemical and physical agencies on plant activities were reported. Potassium has been found essential to the production of carbohydrates, magnesium to their transportation and storage, and lime to the formation of salts or organic acids. The protective and antagonistic action of lime, sodium, potassium, and magnesium have been reported upon by Osterhout, Lipman, Hansteen, and others. Aberson studied root excretions and found their acidity was due to phosphoric acid when any acid reaction was noted. Etiolated sweet peas have been found sensitive to 1 part of

ethylene gas in 10,000,000 of air, thus becoming a delicate test for that gas in greenhouses. Becquerel reports the germination of spores of *Mucor* and other molds after drying, sealing in vacuum tubes for 12 months, subjection to temperature of  $-180^{\circ}\text{C}$ . for 3 weeks and  $-253^{\circ}$  for 77 hours, and standing for 13 months longer before being placed to germinate. Reed has studied the toxicology of *Diplodia zeae* from moldy corn and isolated a product similar to pellagrozein, which Lombroso claimed was the cause of the disease pellagra. Buchanan reports *Monascus purpureus* on moldy corn as the probable cause of the death of a number of horses. Ultraviolet rays have been found to destroy plant tissues and to have remarkable germicidal properties. This action may be made use of in the sterilization of water supplies of considerable size, the action being very rapid.

**PLANT PATHOLOGY.** The life history of a number of additional species of rusts has been worked out by Arthur, Kern, Fischer, and others. The claim has been made of the discovery of sexuality in rusts, and Lutman is conducting similar investigations with the smuts. Johnson has shown that rust epidemics are associated with subnormal temperatures and heavy dews at critical periods of growth of grains. Tubeuf claims that the alternation of generations in some fungi originate from the inability of certain spore forms to penetrate the thick cuticle of leaves, while other forms, notably the teleutospores, find ready entrance. Averna-Sacca claims that the partial immunity of American grapes to mildew and other diseases is due to the greater acidity of their sap as compared with European varieties. Studies made in India indicate that the fungus causing the wilt of cotton in America, while present, is not parasitic. Bolley claims that some of the deterioration in yield of wheat in the Northwest is due to the presence of fungi in the soils and not to soil impoverishment. The chestnut disease (*Diaporthe parasitica*) has spread and is now known to occur at intervals from Massachusetts to West Virginia. In southern Europe the chestnut trees are suffering from a severe canker, more than 25,000 acres of chestnut trees having been destroyed in France alone. The exact cause of the trouble is not known. European and American varieties of chestnuts are all subject to the disease, while the Japanese are immune. The oak mildew that became epidemic in southern Europe a few years ago threatens the reproduction of oaks; scarcely a seedling escaped attack in 1910. Hedgcock has described a crown gall of grapes in New Mexico that is due to *Bacterium tumefacium* following frost injuries and sun scald. What is probably the same disease was recently reported from Peru. Masses has described some crown gall diseases in England, which so far as observed in that country are due to *Dendrophagus globosus*, as described by Toumey. Barre has found the mycelium of the fungus causing cotton anthracnose to be carried by the seeds, and his experiments indicate that by a comparatively short rotation and the use of clean seed the disease may be held in check. Edgerton has made a study of sugar cane diseases and reports the presence of a number of fungi hitherto unrecorded in the United States. Orton reports the dry rot of potatoes due to *Fusarium oxysporum* is becoming one of the most widespread and destructive diseases of that crop.

The bacterial disease of potatoes known in Europe as blackleg is said by Morse to be present in a number of localities in the United States. The leaf-roll disease continues to be troublesome in Germany, and thus far its cause has not been definitely determined. A serious disease or a number of quite similar diseases of bananas threaten the commercial growing of the crop in Central America and parts of South America. Different investigators have attributed the cause of the disease to bacteria, fungi, nematodes, etc., but all agree on the seriousness of the attack. It is said that at the present rate of spreading there will be scarcely a healthy banana plant in Costa Rica within ten years. A large number of diseases of tropical plants have been reported and special investigations have been made of those on cacao and various rubber-producing plants. The bacterial blight of pears has become a serious menace on the Pacific Coast, and O'Gara and others have described cultural methods for its control. Headden insists that arsenic for spraying for insect pest results in a form of canker on apple trees, but Ball, Grossenbacher, and others claim that the injury can not be due to that cause. A large number of new diseases of economic plants have been described within the year. For the control of the fungus diseases studies are being made of various fungicides. A considerable number of proprietary compounds have appeared, but none seems to have any merit not possessed by properly made Bordeaux mixture. Lime-sulphur mixtures have been found to have marked fungicidal action, and they may be used where injury commonly follows the use of Bordeaux mixture. The toxicity of Bordeaux mixture is said to increase upon standing, hence it should always be freshly made.

**LITERATURE.** Among the new books of botany are: J. M. Coulter, *A New Manual of the Botany of the Rocky Mountains*, revised by Aven Nelson; E. L. Greene, *Landmarks of Botanical History*; A. S. Hitchcock and Agnes Chase, *North American Species of Panicum*; J. M. Coulter and C. J. Chamberlain, new edition of *The Morphology of Gymnosperms*; J. M. Coulter, C. R. Barnes, and H. C. Cowles, *A Text-book of Botany*; Wm. Ganong, *The Teaching Botanist*; Knuth, two parts of the *North American Flora*; *Handbook of Flower Pollination*, translated by J. R. A. Davis; Hugo de Vries, an English edition of *The Mutation Theory*; F. Löhnis, *Handbuch der landwirtschaftlichen Bakteriologie*; D. McAlpine, *The Smuts of Australia*; L. Savastano, *Patologia arborea applicata*; C. Massee, *Diseases of Cultivated Plants and Trees*; H. Faes, *Les Maladies des Plantes cultivées et leur Traitement*; F. L. Stevens and J. G. Hall, *Diseases of Economic Plants*.

**BOWDOIN COLLEGE**. An institution of higher learning at Brunswick, Me., founded in 1794. In the year 1910-11 there were enrolled 403 students, while the faculty numbered 64.

This was the largest attendance in the history of the college. The productive funds amounted to \$2,017,733 and the income to \$141,543. The library contains about 100,000 volumes. The President is Rev. William Dewitt Hyde.

**BOWERS**, LLOYD WHEATON. An American lawyer and public official, Solicitor-General of the United States, died September 9, 1910. He was born in Springfield, Mass., in 1859. He graduated from Yale College in 1879 and afterwards studied law at Columbia University, graduating in 1882. In the same year he was admitted to the bar and began to practice in New York City. After remaining there for two years he removed to Minnesota and became a partner of former Chief Justice Wilson at Winona in that State. In 1893 he removed to Chicago, where he became general counsel for the Chicago and Northwestern Railroad. Mr. Bowers was a personal friend of President Taft, and soon after the latter's inauguration in March, 1909, he was appointed Solicitor-General. During the year and five months in which he held the office, he prepared for trial 37 cases, of which 33 were successfully prosecuted. Among the cases on which he was engaged are the Standard Oil and Tobacco cases. Mr. Bowers was often spoken of as a possible member of the Supreme Court of the United States. He was one of the most eminent lawyers in the country.

**BOWLING ASSOCIATION, INTERNATIONAL**. See BOWLING.

**BOWLING**. The tenth annual tournament of the American Bowling Congress was held at Detroit from February 26 to March 16. The individual championship was won by Thomas Haley of Detroit. His nearest competitor was William Richter of Chicago. The two-men team contest was won by Deiker and Waterman of Cincinnati, who rolled 1231. In the five-men team event the Cosmos aggregation of Chicago carried off the laurels with a score of 2880. The world's record for this event is 2962 pins, this score having been made the preceding year by the Lipmans of Chicago. The all-events (nine games) championship went to Thomas Haley, the winner of the individuals. The third annual tournament of the National Bowling Association was held at Baltimore, Md., in April. The winners and scores were: Individual, Tony Prio, Brooklyn, 705; two-men team, Burdein-Eckstein, Washington, 1305; five-men team, the Chalmers of Detroit, 2917. The Corinthians who won this event in 1909 finished second.

**BOWNE**, BORDEN PARKER. An American Methodist Episcopal clergyman, scholar and educator, died April 1, 1910. He was born in Leonardsville, N. J., in 1847 and graduated from the University of the City of New York in 1871. He studied at the universities of Halle, Paris, and Göttingen from 1873 to 1875. In 1875-6 he was assistant professor of modern languages in the University of the City of New York, and in the same year was a member of the staff of the *New York Independent*. In 1876 he became professor of philosophy and dean of the Graduate School of Arts and Sciences in Boston University. He remained in that position until his death. In 1874 he published his first book, *Philosophy of Herbert Spencer*, and this met with such success that he determined to devote his life to the study of philosophy. Professor Bowne was one of the most liberal scholars of

the Methodist denomination, and several times charges of heresy were preferred against him. These charges were, however, not sustained. His reputation as a scholar was high. Among his published writings are: *Philosophy of Herbert Spencer* (1874); *Studies in Theism* (1879); *Metaphysics* (1882); *Introduction to Psychological Theory* (1887); *Philosophy of Theism* (1888); *The Principles of Ethics* (1892); *Theory of Thought and Knowledge*; *The Christian Revelation* (1898); *The Christian Life* (1899); *The Atonement* (1900); *The Immanence of God* (1905); *Personalism* (1907). He also contributed many philosophical and theological articles to reviews and newspapers.

**BOWSER, EDWARD ALBERT.** An American mathematician and engineer, died February 22, 1910. He was born in Sackville, N. B., in 1845 and graduated from Rutgers College in 1868. In 1870 he was appointed professor of mathematics at that institution and was made director of the United States Geodetic Survey of New Jersey in 1875. He continued to hold this position until the time of his death. His published works include *Analytic Geometry* (1880); *Differential Integral Calculus* (1880); *Analytic Mechanics* (1884); *College Algebra* (1888); *Treatise on Trigonometry* (1892); and *Logarithmic Tables* (1895).

**BOXING.** The principal event of the year in pugilistic circles was the Jack Johnson-James Jeffries battle which was fought at Reno, Nevada, on July 4. Johnson won in the 15th round after a strictly one-sided contest. The mill established new records in purse and gate receipts. The purse, \$101,000, was the largest ever contested for. The fight was witnessed by 18,000 persons. (See CALIFORNIA.) Another bout which attracted considerable interest was that between Battling Nelson and Ad Wolgast for the lightweight title. Nelson lost after a stubborn struggle lasting 40 rounds. The defeat of Jeffries and Nelson marked the passing of all except one of the old guard of fighters of the decade. Abe Attell, the featherweight, alone retained his laurels. Stanley Ketchel the middleweight champion was shot and killed in the West, leaving the title open to several claimants, of whom Papke has made the best showing. According to the experts the professional champions in the various classes are: Heavyweight, Johnson; middleweight, open; lightweight, Ad Wolgast; welterweight, "Dixie Kid"; featherweight, Abe Attell and bantamweight, Jimmy Walsh. The Amateur Athletic Union held its annual boxing championships at Boston on April 12. The results of the final bouts were: 105 pound class, James Rothwell of Boston, defeated Charles O'Leary of New York; 115-pound class, John Gallant of Boston defeated H. McEwen of Toronto; 125-pound class, Frank Smith of New York defeated O. Christie of Toronto; 135-pound class, William Volk of Quincy, Mass., defeated William Hopkins of New York; 145-pound class, Hillard Lang of Toronto defeated Thomas Conklin of New York; 158-pound class, William Beckman of New York, defeated William Kenny of New York; heavy-weight class, W. W. Barbour of New York, defeated Joseph Burke of Boston.

**BOYCOTT.** The famous case of Loewe v. Lawlor, known as the Danbury Hatters case, was advanced another stage in February. This case had begun in 1902 when a strike in Loewe's factory had been called for the purpose of main-

taining the closed shop. The contest spread and finally developed into a nation-wide contest. Mr. Loewe was supported by the American Anti-Boycott Association while the Hatters' Union and its friends instituted a secondary boycott with the aid of the American Federation of Labor. In 1908 the Supreme Court of the United States declared a boycott illegal under the anti-trust law, and authorized the complainant to bring suit for damages. This suit was brought before a jury in the United States Circuit Court in Connecticut in October, 1909; in February the jury found that Mr. Loewe had suffered loss to the amount of \$74,000 as a result of the boycott. Under the anti-trust law the actual recoverable damages, therefore, became three times this amount or \$222,000, which some 200 trade unionists were ordered to pay. This fine was not levied upon the Union as such, but upon the individual members. Their property was attached and then released under bond waiting appeal to a higher court on exceptions. On the basis of this decision, suit was brought by one of the New York shirt-waist manufacturers for \$150,000 damages against the International Ladies' Garment Makers of America, the local union, their officers, and certain women who had assisted the striking shirt-waist makers in the winter of 1909-1910. A similar suit was begun by the International Paper Company against its union employes who engaged in a strike during the summer.

The case growing out of the boycott of Buck's Stove and Range Co. by the American Federation of Labor and allied organizations, which was pending in the Supreme Court of the United States at the close of the year, was expected to lead to a definite statement of the legal position of both the primary and the secondary boycott. The briefs in this case were filed early in October. The case against the legal recognition of the boycott was taken up by the American Anti-Boycott Association. It was stated that the case would be pushed to conclusion in spite of the agreement between the Buck's Company and the Federation providing for the union shop. The labor organizations were behind a bill before Congress the purpose of which was to prevent the prosecution of trade unions for maintaining boycotts. It provided that money appropriated for the enforcement of the anti-trust laws should not be spent in prosecuting laborers or labor organizations combining for trade union purposes. An attempt by them to secure the favor of President Taft for the bill called out a statement by him that it was class legislation and that neither he nor they should favor it. See INJUNCTION; and LABOR, AMERICAN FEDERATION OF.

In November, 1909, suit was begun by the Electric Planing Mill of Chickasha, Oklahoma, against the local Trades Council and various trade unions to secure an injunction in restraint of a boycott. A temporary injunction against acts of violence or intimidation was issued; the question thereafter arose whether the fining of a union teamster or a carpenter for failure strictly to observe the boycott should be construed as coercion or intimidation. The court held that it should not be so construed; for while every individual has the right to dispose of his labor powers as he sees fit, yet, if two or more persons contract to submit them-

selves to fines if they individually fail to carry out the agreement to dispose of their labor only under special conditions, such fining is not then coercion. The court held that there is no more coercion in such a case than when a fine is imposed on a club member for violating a by-law. The court, therefore, discontinued the temporary injunction on the ground that, under the existing law of Oklahoma, no violence, coercion or intimidation having been committed, the boycott was legal.

**BOY SCOUTS OF AMERICA.** An organization which has for its purpose character building for boys between the ages of 12 and 18. It is an effort to get boys to appreciate the things about them, and to train them in self-reliance, manhood and good citizenship. The movement was started in England by General Sir Robert Baden-Powell, who was impressed with the fact that 45 per cent. of the boys of England were growing up without any knowledge of useful occupations. The idea became immensely popular and in two years and a half 400,000 boy scouts had been enrolled and 20,000 of these were in parade at one time at London.

The scout idea sprang up spontaneously all over America. Two similar organizations, founded by Dan Beard and Ernest Thompson Seton were combined under the general title, "Boy Scouts of America." The aim of the boy scouts is to supplement the various existing educational agencies and to promote the ability of boys to do things for themselves and for others. The method is summed up in the term "scout-craft" and is a combination of observation, deduction and handiness. It includes first aid, life saving, tracking, signaling, cycling, nature study, seamanship and other instruction. Each body of scouts, which is known as a patrol, selects a leader from among its own numbers. Several patrols are combined in a troop and from these is appointed a scout master who is the leader of the troop. Before he becomes a scout a boy must take the scout's oath, which is as follows: "On my honor I promise that I will do my best, first, to do my duty to God and my country; second, to help other people at all times; third, to obey the scout law." The scouts are divided into three classes, tenderfoot, second-class scout and first-class scout. Before passing from the tenderfoot class to the second or first class, the boy must pass certain tests. The test for first-class scout includes the ability to swim fifty yards; 50 cents at least in the savings bank; signaling; the ability to go on foot or to row a boat alone to a point seven miles away and return; the ability to describe or show the proper means of saving life in case of accidents of various kinds; the ability to cook satisfactorily a prescribed variety of dishes; the ability to read a map correctly and draw an intelligent rough sketch map; the ability to use an axe for felling or trimming light timber; the ability to judge distance, size, numbers and height without 25 per cent. error.

The rules of conduct of the scouts are prescribed by the scout law. This prescribes honor, loyalty, unselfishness, friendliness, a hatred of snobbishness, courtesy, kindness to animals, obedience to parents, cheerfulness and thrift. The Boy Scouts is not a militant body, although its organization is along military lines. A prescribed uniform is worn and medals are

given for faithful service. President Taft is the honorary president of the organization in the United States and Theodore Roosevelt is the honorary vice-president. The chief scout is Ernest Thompson Seton, the chairman of the executive committee is Dan Beard and the Secretary is Lee F. Hanmer.

**BRADDON CLAUSE.** See AUSTRALIA.

**BRADLEY, LUTHER P.** An officer of the United States army, died March 13, 1910. He was born in Connecticut in 1822, and entered the volunteer service as lieutenant-colonel of the 51st Illinois Infantry in 1861. He was promoted to be colonel in 1862 and in 1864 was appointed brigadier-general of volunteers. He resigned in 1865 and was appointed lieutenant-colonel of the 27th infantry in the regular army. He became, in 1879, colonel of the 3d infantry. He was retired by the operation of law on December 3, 1886, having reached the age of 64 years, and was advanced to the rank of brigadier-general on the retired list in 1904. He was brevetted colonel in 1867 for gallant and meritorious services in the battle of Chickamauga, and brigadier-general from the same date for gallant and meritorious services in the battle of Resaca, Georgia.

**BRADY, JOHN.** An American Roman Catholic bishop, died January 6, 1910. He was born in County Cavan in 1842 and studied at All Hallows College, Ireland. He was ordained priest in 1864. He came to the United States and served as assistant pastor in Newburyport, Mass., from 1864 to 1868. In the latter year he became pastor of St. Joseph's church in Amesbury, Mass. He was appointed auxiliary bishop to assist Archbishop Williams of Boston in 1891. He was consecrated titular bishop of Alabama but continued his parochial work in Boston.

**BRAGA, THEOPHILO.** A Portuguese poet, scholar, and public official, president of the provisional republic, which in October, 1910, overthrew the monarchy in Portugal (see PORTUGAL). He was born on the island of São Miguel in the Azores in 1843, where his father was a teacher. His early educational training was at the school, where his father was professor. He worked in a printing shop in his early youth and there supplemented his educational training by such reading as was available. At the age of sixteen he published a small collection of sentimental verses called *Folhas Verdes* ("Green Leaves"). On account of domestic unhappiness he was about to go to America, when he was persuaded by his father to go instead to Coimbra to enter a course in law. This he did in 1861. He found time, in the midst of his legal studies and his labors, to earn a sustenance, to continue the writing of poetry, and in 1864 he published a long epic poem, *Vision of the Ages*. The success of this poem was immediate, especially among the young, progressive Portuguese. In 1868 he was admitted to the doctorate of the law. For three years following he wrote verse and published a collection of early Portuguese popular songs, endeavoring in the meantime to obtain an educational appointment. In 1872 he won, by competition, the chair of modern languages in the *Curso Superior de Lettras* in Lisbon. Almost immediately he began the writing of the *History of Portuguese Literature*, of which 32 volumes have already been published. A few years later he filled temporarily the chair of

universal history at the Curso, and this led him into a new field of investigation embodied in the *Universal History*. He began the study of philosophy and soon became the leading representative of positivism in Portugal, explaining his ideas in *General Outlines of Positivistic Philosophy* and in the *System of Sociology*. He also carried on investigations in Portuguese ethnology and folk-lore. He wrote also *A History of the University of Coimbra*, and a volume entitled *Positivistic Solutions of Portuguese Politics*. In the midst of these scholarly pursuits he entered actively into politics. He was editor of the paper called *O Positivismo* and was a Republican leader in the Cortes. He has been tireless in his efforts to spread his teachings, not merely as abstract doctrines, but as a practical solution of the problems which confront the Portuguese people. He has been the leading spirit in the Republican movement of Portugal for years. In the forty years during which he taught in Lisbon he wrote more than one hundred books covering almost every phase of Portuguese life and thought. He also maintained relations with the principal thinkers of Europe. See PORTUGAL, paragraphs on *History*.

**BRANDEIS, LOUIS D.** See UNITED STATES, section ADMINISTRATION; and RAILWAYS.

**BRANDY.** See LIQUORS, FERMENTED AND DISTILLED.

**BRAYTON, CHARLES RAY.** An American lawyer and politician, died September 22, 1910. He was born in Warwick, R. I., in 1840, and from 1859 to 1861 attended Brown University. In the latter year he enlisted for service in the Civil War and served until 1865, when he was brevetted brigadier-general of volunteers for faithful and meritorious services. He was appointed captain in the 17th United States Infantry in 1867, but resigned the same year. He was admitted to the bar in 1891. From 1870 to 1874 he was United States pension agent of Rhode Island and from 1874 to 1880 he was postmaster of Providence. In 1876-7 he was chairman of the Republican State Central Committee. In 1886-7 he was chief of the Rhode Island State police. From 1896 to the time of his death he was a member of the Republican National Committee. General Brayton, who was blind, had for thirty years complete political control of the State of Rhode Island and in spite of attempts made at various times to dislodge him held this position until he died. In 1907 James H. Higgins became Democratic governor of the State. His chief campaign argument had been opposition to the political control of General Brayton and as soon as he took the chair of office he undertook to drive Brayton from his headquarters in the office of the sheriff of Providence county in the State House. Although General Brayton had, at that time, no political position in the State, he occupied this office and from it dictated the political policies that he wished put into effect. The sheriff refused to give the order to eject General Brayton from his office. His powers over the political destinies of Rhode Island had their foundation in the fact that the governor of Rhode Island had little power and that by laws of representation the small towns in the State are entitled to the same number of representatives as the large cities. General Brayton's power lay in his ability to control the representatives from the small towns. He was

the last of the great bosses who controlled state politics.

**BRAZIL, UNITED STATES OF.** The largest republic of South America. Capital and largest city, Rio de Janeiro.

**AREA AND POPULATION.** The estimated area of the 20 states and Federal District is 3,218,139 square miles. The census of 1900 showed 17,318,556 inhabitants. In addition, the Acre territory, acquired from Bolivia in 1903, has about 73,720 square miles and 65,000 inhabitants. An estimate of 1908 placed the total population at 20,515,000. The results of the census of December, 1910, are not yet available, but doubtless the population exceeded 21,000,000. Estimates (probably not very accurate) of municipal populations in 1910 were: Rio de Janeiro, 1,000,000; São Paulo, 400,000; Bahia, 350,000; Pará, 200,000; Pernambuco, 150,000; Porto Alegre, 100,000; Ceará, 50,000; Manaus, 50,000.

From 1820 to the end of 1909 immigrants to Brazil numbered 2,742,622, of whom 1,240,708 were Italians, 702,790 Portuguese, 319,762 Spaniards, and 101,419 Germans. In 1907 immigrants numbered 67,786; in 1908, 94,695; in 1909, 85,416; of the last number, 42,765 entered at Rio de Janeiro and 36,014 at Santos, and 30,577 were Portuguese, 16,219 Spaniards, 13,668 Italians, 5663 Russians, 4027 Turks, and 4008 Austro-Hungarians.

In general the people have little education. Primary instruction is not compulsory (though nominally so in some parts of the country), but in recent years, it is said, has made considerable progress. According to statistics recently published at Rio de Janeiro, primary schools number 11,147, with 565,922 pupils, and secondary schools 327, with 30,258 pupils. These figures include both public and private schools. There is no real university in the republic, but various establishments offer some opportunity for technical and professional instruction. Roman Catholicism is the prevailing religion, but ecclesiastical equality obtains.

**INDUSTRIES.** The principal industry is agriculture, though only a small part of the country is under cultivation. The chief crop is coffee, which is grown in the states of Espírito Santo, Minas Geraes, and Rio de Janeiro, but mostly in São Paulo. Coffee production for years ending June 30 is reported as follows: 1901, 10,989,166 bags (of 60 kilos each); 1905, 10,014,560 bags; 1907, 19,832,033 bags; 1909, 12,459,744 bags; 1910, 15,051,756 bags. Vigorous efforts are being made, especially by the state of São Paulo, to maintain the price of coffee, by imposing an additional tax on exports over a certain amount and by encouraging consumption. In the production of cacao, as well as coffee, Brazil ranks first, the cacao crop (produced chiefly in the state of Bahia) amounting to over 72,000,000 pounds a year. About half of Brazil's sugar yield is in the state of Pernambuco, which produced in 1909 about 156,000 tons and in 1910 (estimated) over 200,000 tons. Tobacco is raised in increasingly large amounts, especially in Bahia. Other crops are rice, corn, yerba mate, and bananas. Rubber (including caucho) received at Pará in the fiscal year 1909 amounted to 38,008 metric tons; in 1910, 39,230. In 1910 shocking conditions, recalling those in the Congo, were reported in connection with a British syndicate and its system of enforced rubber collection in the Amazon valley.

Cattle-raising is an important industry, the

**THEOPHILO BRAGA**  
**PRESIDENT OF PORTUGAL**

10701

number of cattle in the country being perhaps 25,000,000. About 625,000 cattle are slaughtered annually in the state of Rio Grande do Sul, where the most important of the jerked-beef establishments are situated; in Matto Grosso, about 605,000; in Minas Geraes, 325,000; in the state of Rio de Janeiro and the Federal District, 225,000; in São Paulo, 135,000.

The mineral resources, which are considerable, for the most part await development. The minerals now produced in paying quantities include gold, diamonds, monazite, manganese, and mercury.

According to recently published statistics there are 3420 industrial establishments in the republic, employing 159,601 operatives and having a total capital of 681,848,663 milreis and an annual output valued at 769,782,108 milreis. The number of establishments in the Federal District is 807, with 182,314,045 milreis capital and 243,976,542 production. São Paulo is next, with 334 establishments and capital and production of 128,462,191 and 120,735,091 milreis. Of the total capitalization, 40 per cent. represents the textile industry. Cotton mills number 161, with 234,028,403 milreis capital and 135,025,663 production. The capital invested in the jute industry is placed at 15,799,500 milreis and the production 22,389,730; similar figures for the woolen industry are 14,848,000 and 11,375,000 milreis respectively. Total horse-power reported, 192,284.

FOREIGN COMMERCE. The values of imports and exports of merchandise have been as follows:

	1907	1908	1909
Imp.	\$197,227,579	\$173,017,849	\$179,690,125
Exp.	263,651,874	215,266,136	308,331,829

The values of classified imports in 1908 and 1909 respectively were: Manufactures, \$91,054,980 and \$95,873,783; food products, \$48,036,027 and \$50,049,663; raw materials, etc., \$33,062,963 and \$32,573,602; live animals, \$863,868 and \$1,393,077. The leading imports in 1908 and 1909 were valued as follows: Iron and steel manufactures, \$18,963,633 and \$19,387,837 (including rails, etc., \$4,724,061 and \$7,077,896); machinery, etc., \$16,339,606 and \$17,132,316; stone, earthen, and various minerals, \$14,159,963 and \$13,219,408 (including coal, \$9,664,560 and \$8,689,482); cotton manufactures, \$13,468,676 and \$12,479,495; flour, \$9,041,481 and \$9,269,847; arms and munitions, \$1,468,802 and \$5,764,458; chemicals, drugs, etc., \$3,745,947 and \$4,256,058; codfish, \$4,541,354 and \$4,079,400; paper manufactures, \$4,451,961 and \$3,953,983; kerosene, \$3,605,095 and \$3,681,209; manufactures of stone, earth, etc., including porcelain, \$3,864,382 and \$3,605,626; cotton yarn, etc., \$2,389,595 and \$2,553,458; woolen manufactures, \$2,907,073 and \$2,472,616.

The value of the principal exports in 1908 and the value and quantity (in metric tons) in 1909 are shown in the following table:

	Value	Quantity
	1908	1909
Coffee .....	\$111,740,270	\$161,922,682
Rubber .....	57,155,489	91,578,388
Hides .....	6,384,555	8,812,660
Yerba maté ..	8,004,154	8,025,333
Cacao .....	9,590,666	7,739,870
Tobacco .....	4,080,257	6,443,681
Skins .....	3,414,987	4,709,492
Sugar .....	1,482,146	3,247,504
Cotton .....	999,866	2,861,662

\* Bags of 60 kilos each.

Other noteworthy exports in 1909 were valued as follows: Bar gold, \$2,252,898 (4323 kilos); manganese, \$1,730,311; nuts, \$1,493,712; carnauba wax, \$1,230,638; bran, \$1,210,572; cotton seed, \$711,401; monazite sand, \$708,092; precious stones, \$288,212. In 1908 the coffee export amounted to 12,658,457 bags; rubber, 38,206 metric tons; hides, 30,412 metric tons; yerba maté, 55,315; cacao, 32,956; tobacco, 15,264. In 1905 Brazil's imports amounted to \$142,185,804, and her exports, \$223,161,260. In general the changes in the import trade during the last five years indicate that the country has started to manufacture the coarser goods it uses and to supply its simpler needs. In exports there has been little change, coffee and rubber continuing to form over 80 per cent. of the whole.

Imports and exports by countries, in thousands of dollars (U. S. gold), were as follows in 1908 and 1909:

	Imports from	Exports to
	1908	1909
Great Britain ....	49,846	48,241
Germany .....	25,699	28,007
United States ....	20,954	22,266
France .....	15,595	18,610
Argentina .....	17,531	17,923
Portugal .....	8,952	9,995
Belgium .....	8,078	7,280
Uruguay .....	5,338	6,294
Italy .....	5,872	5,237
Aust.-Hung. ....	2,770	2,366
Newfoundland ...	2,470	2,009
Switzerland .....	1,704	1,963
Netherlands .....	940	1,749
Spain .....	1,590	1,522
Norway .....	1,510	1,505
Canada .....	1,138	954
Other .....	3,030	3,771
Total .....	173,018	179,690

At the principal ports imports and exports in 1909 were valued as follows: Rio de Janeiro, \$67,625,191 and \$34,630,104 respectively (coffee, \$27,650,578); Santos, \$34,592,964 and \$130,943,928 (coffee, \$130,213,761); Pará, \$14,864,273 and \$40,431,527 (rubber, \$38,881,468); Rio Grande do Sul, \$12,762,619 and \$2,621,379; Bahia, \$8,754,838 and \$19,842,983 (cacao, \$6,606,371; tobacco, \$6,129,239); Pernambuco, \$12,762,619 and \$5,712,092 (sugar, \$2,289,456); Manaus, \$9,170,833 and \$45,750,081 (rubber, \$44,857,102).

SHIPPING. Entered in 1908 20,093 vessels, of 18,673,898 tons (Brazilian, 15,175, of 6,784,970 tons); steam, 15,031, of 18,280,897 tons (Brazilian, 10,492, of 6,583,279). Merchant marine (1909): 224 steamers, of 120,672 tons net; sail, 298, of 62,613 tons.

COMMUNICATIONS. The reported railway mileage at the end of 1908 was 11,843; at the end of 1909, 12,209; on September 15, 1910, 13,410, of which 5443 miles were state-owned. Of the increase in 1909, 290 miles belong to the Federal government and 76 miles to state governments. Railway construction in Brazil began with the purpose not of facilitating internal commerce but of bringing the products of a contributing interior territory to the nearest seaport. Thus Pernambuco became the focus of one system, Bahia of another, and Rio de Janeiro, Santos, and Rio Grande do Sul of others. For some time the need of connecting the various systems has been recognized as imperative, and at present there is a notable activity in railway extension. This activity is not limited to the

coastal region; there are under construction a line from the Santos (or São Paulo) system westward toward Corumbá near the Bolivian frontier and another from the Rio de Janeiro system northwestward into the state of Goyaz. In the north various extensions of the Ceará system are under construction. In the west work on the line which will connect the navigable waters of the Madeira and Mamoré rivers (passing around the falls of the Madeira) progressed favorably in 1909, and it was expected that about 108 miles, or half the total length, would be completed by the end of the year. Steamer service is maintained on the Amazon and some other rivers.

At the end of 1909, the telegraph system, including subfluvial and coastal cables, comprised 18,874 miles of line, with over 2000 offices. There are upwards of 3250 post-offices.

**FINANCE.** Ordinary revenue for 1909 is stated at 86,724,376 milreis gold and 290,031,934 milreis paper; extraordinary, 48,886,153 paper; in addition, from issue of new obligations, 18,083,000 paper; total, 86,724,376 gold and 357,001,087 paper. Ordinary expenditure, 74,449,102 milreis gold and 365,869,984 milreis paper; extraordinary, 28,140,056 gold; in addition, redemption of paper money, 1,973,615 paper; total, 102,589,158 gold and 367,843,599 paper. Estimated revenue for 1910: Ordinary, 84,940,526 milreis gold and 299,558,400 milreis paper; extraordinary, 19,463,333 gold and 13,560,000 paper. Estimated expenditure for 1910, 53,628,369 milreis gold and 349,455,466 milreis paper. More than half the revenue is derived from import duties. Larger estimated expenditures (1910): Finances, 36,291,294 milreis gold and 97,338,322 paper; communications and public works, 8,353,314 gold and 91,815,385 paper; navy, 5,000,000 gold and 41,564,326 paper; army, 750,000 gold and 63,207,744 paper; interior and justice, 13,500 gold and 35,722,846 paper.

The foreign debt, as reported in 1910, amounted to £78,320,078 (including £10,000,000 bonds of 1910); in addition railway loans, etc., aggregated 240,000,000 francs. On January 3, 1910, a decree of the President authorized the resumption, during the year, of payments on the foreign debt. Under the agreement of June, 1898, amortization was suspended until June, 1911. In 1910 the internal debt stood at 538,011,600 milreis paper, and the floating debt, 268,224,773. The paper money in circulation on December 31, 1908, was 634,682,852 milreis and March 31, 1910, 627,075,261 milreis. The gold milreis is worth 54.6 cents, and the paper milreis from 30 to 33 cents. In his inaugural address, November 15, 1910, the President announced his adherence to a policy of retrenchment, of strengthening the sinking and guaranty funds, and of the continued withdrawal of paper money from circulation in accordance with the law of 1898.

**ARMY.** Military service in Brazil, by the law of January 4, 1908, is compulsory for every citizen from his 21st to 44th year. Two years are spent with the colors and seven years in the reserve of the first line, and 4 years in the National Guard and 4 in its reserve. The permanent army, under the organization of 1907, had 15 regiments of infantry, 3 battalions of 3 companies each, 12 regiments of light infantry and 15 machine-gun companies. There were 9 regiments of cavalry and 3 independent regiments, 10 squadrons for infantry brigades and 12 sec-

tions of scouts. The artillery consisted of 45 4-gun field batteries and 5 6-gun howitzer batteries, 9 4-gun horse batteries, 6 4-gun mountain batteries, in addition to position batteries, ammunition columns, engineers and railway troops. For military purposes the country is divided into 13 military districts. The peace strength of the army in 1910 was estimated at about 30,000.

**NAVY.** The 1907 naval programme provided for 3 additional battleships of the Dreadnought type, 3 cruisers, 15 torpedo-boat destroyers, 3 submarines, and 2 auxiliary vessels. It was expected that all of these vessels would be delivered before the end of 1910, excepting the first-class battleship *Rio de Janeiro*, of about 19,000 tons displacement. As reported for 1910, the navy included: 2 first-class battleships, *Minas Geraes* and *São Paulo*, of about 19,000 tons each; one battleship, *Riachuelo*, of 5700 tons; 2 armored coast-guards, aggregating 6320 tons; 4 scout cruisers, 6200 tons; one protected cruiser, 3450; 2 second-class cruisers, 5840; 2 monitors, 940; 3 torpedo cruisers, 3090; 1 gunboat, 800; 1 old torpedo-boat destroyer, 500; 10 modern torpedo-boat destroyers, 6500. In addition there are several old vessels, river gunboats, school-ships, etc.

**GOVERNMENT.** The executive authority is vested in a president, who is elected for a term of four years and is assisted by a cabinet of seven ministers appointed by and responsible to himself. The legislative power devolves upon a Congress of two houses, the Senate (63 members elected for nine years) and the Chamber of Deputies (212 members, three years). The President, Senators and Deputies are chosen by popular vote. The President for the term beginning November 15, 1906, was Affonso Moreira Penna; he died in June, 1909, and was succeeded by the Vice-President, Nilo Peçanha. The latter was succeeded on November 15, 1910, by Marshal Hermes da Fonseca, who was elected on March 1. He is a nephew of Marshal Deodoro da Fonseca, the first President of the republic. The states have their own elected governors and legislatures.

**HISTORY.** In the election of March 1, 1910, Marshal Hermes da Fonseca, a leader of the Conservative party and former Minister of War, was elected by 233,882 votes, as against 126,690 cast for Senhor Ruy Barbosa. Congress opened on May 3. President Peçanha announced an improved financial condition, saying that the government's policy of economy had enabled it to raise over \$45,000,000, which had been paid out to meet the expenses of the new squadron, the new army equipments, and works of public improvement. Under the chairmanship of the Apostolic Nuncio, settled the pending differences between Brazil and Peru to the satisfaction of both parties. A disturbance occurred in the state of Amazonas, where the Governor was removed by the Opposition, who were aided by Federal troops. A Federal flotilla bombarded the town of Manaus at the instance of the Opposition leader, disturbances having arisen in the town. The President of the republic ordered the immediate reinstatement of the Governor. A slight difficulty with Argentina arising from certain insults to the flag in the respective capitals was adjusted satisfactorily to both governments in a protocol signed on August 18. The new President, Marshal Fonseca, was inaugurated on November 15. In his inaugural address he promised strict administra-

tion of justice and an energetic policy in the promotion of education and the development of trade. As to the currency, while it was desirable to reach a metallic basis, this must not be sought by hazardous means, but by providing for conversion by adequate sinking and guaranty funds and through the reduction of expenditure. It was reported by the Consul-General at Rio that in 1910 the American trade in Brazil was found to be increasing, but was held back by lack of properly trained representatives of American business and by defective transportation and banking facilities. German exporters had made great progress during the last decade and had secured about the same share of Brazilian commerce as the United States.

On the night of November 22 the crews of the two Brazilian warships, *Minas Geraes* and *São Paulo*, mutinied in the harbor of Rio de Janeiro, killed several of their officers, and then trained their guns on other vessels and on the city. Some of the coast-defense ships joined them, and the rebels finally controlled the greater part of the Brazilian navy. They flew the red flag and sailed about the harbor. Finally they sent a message to the President demanding the abolition of corporal punishment, increase of pay and a reduction of the hours of labor. Receiving no response they began the bombardment of the city on the following day. A member of the Chamber of Deputies went out to them with a flag of truce. The Senate yielded to the mutineers' demands for amnesty, but the Chamber of Deputies hesitated. The *Minas Geraes* thereupon took a post opposite the Government Palace and dropped shells near the naval arsenal. Thereupon the Chamber granted their demands and passed an act of general amnesty. Meanwhile the mutineers had put out to sea, but they returned on November 27 and gave up their ships to the government. They sent a message to the President expressing repentance for their action and saying that they surrendered their arms confident that amnesty would be granted. They declared that they would henceforth be obedient to the President. On the night of December 9 the marine corps stationed in forts in the harbor of Rio de Janeiro mutinied, and were soon joined by men on a scout ship. The position of the mutineers was bombarded on the following morning and they responded with shrapnel. The bombardment lasted ten hours, but finally on December 10, at eleven o'clock, the mutineers surrendered, having suffered a loss of more than 200 killed and wounded.

**BREEDING.** See STOCK RAISING; BIOLOGY; BOTANY.

**BRETHREN, CHURCH OF THE**, also known as **DUNKERS** or **DUNKARDS**. A religious organization including a considerable body of Christians, whose faith and practice are not generally known outside of the localities in which they live. It originated in Germany in 1708, with Alexander Mack as the leader. Driven by persecution bodies of worshippers came to the United States and made their first settlement near Germantown, Pa. From thence they spread to various sections of the country. They recognize the New Testament as the rule of conduct, believe in the Trinity, and hold faith, repentance and baptism by triple immersion as conditions of pardon and

membership. They observe foot-washing as a religious rite, followed by an evening meal which is called the Lord's Supper. There are three groups in the denomination—the Conservatives, Progressives, and Old Orders. The Conservatives are the most numerous and number about 100,000, with 900 congregations and over 3000 ministers. This body sustains ten colleges and one of the largest denominational printing houses in the West, known as the Brethren Publishing House, at Elgin, Ill. The official organ is *The Gospel Messenger*. The General Conference of this body was held at Winona Lake in June, 1910. During the latter part of the year Elder Galen B. Royer, secretary and treasurer of the General Mission Board, visited the churches in Denmark, Sweden, France and Switzerland. Two missionaries were added to the force in foreign fields during the year, one going to India and the other to China. At the General Conference held in Des Moines, Ia., in 1908, the change of name of the organization from German Baptist Brethren to the Church of the Brethren was made. Dunker or Dunkard is a name that is not recognized within the denomination. The Progressive Brethren number about 17,000, and the Old Order, 4000. The former maintain a college and publishing house at Ashland, Ohio. A small body known as the Seventh Day German Baptists is now nearly extinct. The few members who are left live in the vicinity of Ephrata, Pa.

**BREWER, DAVID JOSIAH.** An associate justice of the United States Supreme Court, died March 28, 1910. He was born in Smyrna, Asia Minor, 1837. His father was a missionary in that city. He graduated from Yale College in 1856. Among his classmates were Senator Chauncey M. Depew and Justice Brown of the United States Supreme Court. Justice Brewer was a nephew of the late Stephen J. Field. After his graduation from college he studied for a time in the office of his uncle, Dudley Field, in New York City. He subsequently took a course in law at Albany and graduated from the Albany Law School in 1858. In the following year he removed to Leavenworth, Kansas, where he took up the practice of law at a time when that State was the battle-ground of the pro-slavery and anti-slavery factions. He filled the office of United States Commissioner and was judge of the probate and circuit courts. He was appointed a United States district judge in 1865 and remained on that bench for the four years following. In 1869 he became county attorney, and from 1870 to 1884 was a justice of the Supreme Court of Kansas. From the latter date until 1889 he was a judge of the United States Circuit Court, holding this position until his appointment in the last-named year to the Supreme Court bench by President Harrison. Justice Brewer in 1896 was appointed by President Cleveland a member of the Venezuelan Boundary Commission, and was also a member of the Venezuelan British Arbitration Tribunal in 1899. In 1904 he became president of the Universal Congress of Lawyers and Jurists. Justice Brewer devoted a great deal of attention to current economic problems, and he delivered a number of addresses on constitutional, legal, and governmental subjects, which attracted wide attention. His views on current problems were broad and he had a notable sympathy for all progressive movements. On several occasions during President Roosevelt's administration he

made addresses which severely criticised the former for certain of his more aggressive and radical policies. His legal knowledge was profound and he was considered one of the ablest of the line of eminent jurists who have occupied seats on the bench of the Supreme Court of the United States. He was the author of several books, among them, *The Pew for the Pulpit* (1897); *The Twentieth Century from Another View Point* (1899); *American Citizenship* (1902); and *The United States a Christian Nation* (1905).

**BREWER, WILLIAM HENRY.** An American scientist and educator, died November 2, 1910. He was born in Poughkeepsie, N. Y., in 1828. He entered Yale with the first class of the Scientific School of that institution and graduated with the degree of Bachelor of Philosophy in 1852. He studied at Heidelberg, Munich and Paris, and on his return to the United States was chosen professor of chemistry and geology in Washington College, Pennsylvania, serving in that position two years. From 1860 to 1864 he was first professor of the Geological Survey of California, and in 1863-4 was professor of chemistry in the University of California. In 1864 he was appointed professor of agriculture at the Sheffield Scientific School and held this chair until 1903, when he became president emeritus. Professor Brewer did much important work as an explorer. With Clarence King, he surveyed large tracts of the Sierras, and one of the highest peaks in those mountains is named Mt. Brewer in his honor. In 1904 he was one of the party on the famous trip of the *Miranda* into the Arctic regions. The trip was attended with many hardships, which included the grounding of the vessel on rocks. He was associated in both Connecticut and California with various governmental surveys, geological and topographical. He was a member of the National and Connecticut Academies of Sciences, and was at different times president of each. Professor Brewer was an eminent geologist and expert mining engineer, an Arctic explorer, art critic and author. During his service at Yale University he was one of the best known and popular members of the faculty. He wrote *The Botany of California* (1875), as well as many scientific reports and articles in scientific journals. In 1906 he was a member of the United States Forestry Commission, and in 1903 was a member of the Scientific Survey of the Philippine Islands.

**BRICK TRUST.** See TRUSTS.

**BRIDGES.** The record of bridge construction in 1910 did not reveal any work of great importance either on the score of magnitude or for novelty of design. Below follow descriptions of some of the more noteworthy structures of the year.

**QUEBEC BRIDGE.** Since the collapse of the unfinished bridge over the St. Lawrence at Quebec in 1907, several plans for a new structure have been under consideration. During the year 1910, after examining many designs and proposals, the Bridge Board recommended for adoption a plan that involved a five span bridge, namely: 2 anchor, 2 cantilever, and 1 suspended girder spans, all of equal length, 586 feet. The bridge

will carry 2 railroad tracks, 2 trolley tracks, 2 roadways and 2 footpaths, all on the same level. Work had begun and the caisson for the north pier, adjoining the pier of the original bridge, had been sunk at the end of the year.

**ELECTRIC RAILWAY BRIDGE AT ST. LOUIS.** Among the notable steel bridges completed was that known as the McKinley Bridge, to carry the lines of the Illinois Traction System, aggregating about 550 miles of inter-urban roads, across the Mississippi from East St. Louis, Ill., to St. Louis, Mo. It is about three-quarters of a mile below the Merchants Bridge, and three miles above the older Eads Bridge, and has two piers in the river channel. On the Illinois side are two approach spans, one 150 feet and the other 250 feet long, both deck trusses. Beyond these are three channel spans, each 517½ feet long, of the through truss type, and giving 550 feet clear waterway between the piers. At mean high water there is 50 feet head room under this part of the bridge, except at the extreme channel piers, where it is only 45 feet. From this point, approaching the Missouri side of the river are three deck truss spans, one 250 feet and two of 150 feet each, beyond which is a 98-foot deck plate girder span to carry the structure of the bridge over the Burlington railroad tracks. The through trusses of the channel spans are 78 feet deep at centre, with eighteen panels 28 feet 9 inches long centre to centre. The two trolley car tracks rest on transverse beams between the trusses, outside of which are roadways, each 13 feet wide, supported by cantilever floor beams. The design of the structure was so drawn that if it should become necessary, in the future, to allow steam locomotives and the corresponding heavy cars to use the bridge, heavier members could be substituted for those that now compose it, at moderate cost. During the earlier stages of construction, work was delayed by the loss of the false work of the middle channel span and a large traveler used for erecting the steel-work, by the sudden action of a flood that carried an immense amount of ice down and drove everything before it.

**EIGHT TRACK LIFT BRIDGE, CHICAGO.** A notable bridge was completed over the Sanitary and Ship Canal at Campbell Avenue and 31st Street, Chicago. To carry eight railway tracks over a navigable waterway required an unusual design. In this case, the Scherzer rolling lift type of bridge was adopted, and in order to keep the weight of the movable parts within reasonable limits, it was built of four sections, that is to say, four rolling lift spans side by side, each carrying two tracks, and pivoted on the same trunnion pier. Each span is 154 feet long, centre to centre of bearings, and is 29 feet wide. The bridge is set on a skew of 21 degrees from the centre line of the canal, and when open gives a clear waterway 120 feet wide for navigation. An approach span at either end of the lift span gives another 89 feet waterway, but of course for small craft, such as launches, only. Each lifting bridge is raised by means of two 50-horsepower direct current electric motors, control of which is interlocked with the signals governing the tracks passing over it. The locking or latching of each span is effected by a 3-horsepower motor also interlocked with the signals, thus putting an effective control over approaching trains in either direction.

**CONCRETE VIADUCT, KNOXVILLE, TENN.** Among the reinforced concrete bridges built during the

year was one at Asylum Avenue, Knoxville, Tenn., that differs from most of the recent works of this character in being of girder type. It is 328 feet long, and carries a roadway with two sidewalks across two lines of railway and a small stream, known as Second Creek, with an intersecting approach at one end, leaving the main approach at an angle of 30°. The roadway is 28 feet wide, with the two sidewalks 6 feet wide each. There are three 46 feet spans, two 48 feet skew spans, four 23 feet spans, and three short approaches. Each span has three uniformly spaced pilaster columns carrying a transverse floor-beam, on which rest six main longitudinal girders and two shallower fascia girders that carry the floor slab of the sidewalk. There is one deep transverse floor-beam between each set of columns. The upper deck girders and main floor slab are built independently of the supports, and the whole floor has a two-inch free expansion space. Provision is made for one trolley track across the structure, and at each span a 24-inch cast iron pipe was set in the roadway to serve as a base for the poles that will carry the trolley wire. The reinforcement presents no unusual features,  $\frac{1}{2}$  inch and  $\frac{3}{4}$  inch steel being used in that part of the work. The location, requirements of traffic and a variety of other considerations determined the girder type of bridge here in preference to an arch.

**REINFORCED CONCRETE ARCH BRIDGE.** At Auckland, New Zealand, a bridge was completed that was notable as the longest span concrete arch built, up to 1910. It carries Grafton Street across a deep gully, and it has a total length, including approaches, of 960 feet. The main span is an arch of 320 feet and consists of two separate ribs, between which are cross streets. From the ribs and streets, slender columns carry the floor and roadway. On one side of the 320 foot arch span are six approach spans, varying in length from 35 feet to 81 feet; and on the other are three approach spans, 43 feet to 81 feet. The piers from which the main arch springs are 100 feet high and 18 feet wide at the top. The roadway is 24 feet wide, and on either side is a 6-foot sidewalk, on the outside of which is an ornamental parapet. The entire work is of reinforced concrete, the cement for which was furnished from a nearby establishment. To form an idea of the size of the undertaking, it is to be noted that in constructing the centring for the main arch span, about 400,000 feet of lumber were used. In addition to this, a large amount was required for the forms and centres for the remainder of the bridge. The cost of the structure was \$163,000.

**MEADOW STREET BRIDGE, PITTSBURG, PA.** Another bridge, of similar design, and built of reinforced concrete, was one recently constructed across a valley and small stream at East Liberty, a suburb of Pittsburg, Pa. The arch of this bridge is 209 feet span and 46 feet high above the springing line. The whole structure is 454 feet long, with a 30-foot roadway and two sidewalks 10 feet wide each.

**PEND OREILLE RIVER BRIDGE.** An unusual piece of work in bridge erection was done on the Idaho and Washington Northern Railroad, which follows up the valley of the Pend Oreille River on its new extension to Metaline, Wash. The line had to be carried across the river in Box Canyon, where the walls are steep and rocky. While it was possible to get locations for abutments on the cliffs, it was out of the

question to use false work for the erection of the spans, as the track level was to be 140 feet above the water, which furthermore was very deep, 200 feet at that point, and had a swift current. After the shore span, 145 feet long, was built, the 280-foot main channel span was started out from the pier and tied back to the former by means of temporary eye-bars. As the completed channel span was estimated to weigh about 700 tons, the structure to which it was secured, and which had to hold the increasing weight as construction progressed, was anchored fast by loading it with about 600 tons of rails, distributed over its length. Material was put in place by a derrick car, run out on the span as it was built; and owing to the location and surroundings, work could be carried on from one end only. This method of erecting a bridge was not new, but was unusual, and under the circumstances was the cheapest way of surmounting the difficulty of erection for a bridge of the size of this one, 500 feet in all.

**STEEL VIADUCT, ERIE RAILROAD.** During the year the Erie Railroad put in use an improvement at the west end of Jersey City, N. J., that, while not remarkable as a piece of bridgework, was of great importance to the traveling public, and during its construction involved careful management and engineering skill in putting in foundations. In order to avoid the use of Bergen Hill Tunnel, that accommodated only two tracks and was objectionable for passenger traffic, a cut was made through the hill and the line relocated and run on a different grade, making it an elevated road all the way from the yard and terminus on the Hudson River to the new cut, a distance of about 2600 feet. The steel portion is 1776 feet long, and consists of deck plate girders, alternately 30 feet and 61 feet long, supported on transverse girders that rest on three columns each. The pedestals for the columns were in some cases put down on a pile foundation, and in others to a concrete filled caisson. The underlying soil was a hard sand, well saturated with ground water. Experiments showed that a reinforced concrete pile gave the best results in supporting a structure of this kind, and accordingly a pile of this sort 8 inches by 8 inches at the lower end and 16 inches by 16 inches at the top, was used in groups, on which to rest the concrete pedestals of the steel columns. There were 250 of these piles used, from 38 feet to 65 feet long. Under some of the columns, however, the sand was regarded as of a nature too wet and soft to give the lateral pressure needed to properly hold a pile, and in these cases, caissons were put down, 6 feet in diameter, without air pressure filled with concrete and on these the pedestals were built up. The difficulties of the work were not diminished by the necessity of carrying all the traffic over the principal portion of this line without interruption or serious delay.

**COPPER RIVER BRIDGE.** On the Copper River and Northwestern Railroad in Alaska an interesting bridge has been completed under extraordinary engineering conditions and costing approximately one-half million dollars. It consisted of four camel back spans aggregating 1550 feet, resting on three concrete piers, and two massive abutments. Two of the spans are each 450 feet in length and the others are 300 and 450 feet in length. As two large glaciers are in close proximity to the work and the river is either

frozen or else moves with a fourteen-miles-an-hour current, the work presented many difficulties. With a depth of ice of six feet during the winter months it was possible to use the ice itself to hold the piling for the false work, letting it rest directly on the river bottom. Accordingly the first two spans were erected before the ice went out of the stream and then the big span was cantilevered from the 300-foot span. Copper River Bridge is by far the most important work that has been executed in the northwest and is typical of much of the engineering that must be done on this Alaskan Railway.

**CONSTANTINE VIADUCT.** An interesting masonry bridge was completed at Constantine in Algeria, crossing the deep and precipitous gorge of the Rhumel River. The bridge takes the form of a viaduct 1475 feet in length and comprising 27 arches of very unequal dimensions. Over the gorge itself the largest of these arches was built with a span of 230 feet and a height of about 330 feet above the bed of the river. The viaduct resembles the famous Luxemburg bridge and consists of two parallel arches each 13 feet deep, supported by an interval of 13 feet and connected at the crown by a plate of reinforced concrete.

**A LARGE MASONRY ARCH BRIDGE.** During the year there was erected on the new Belle Gardez Electric Railway in France a notably long span masonry arch bridge. This bridge has a main span of two hundred and sixty-two feet nine and one-half inches and crosses the Valseriene stream, a tributary to the Rhone, in a wild and picturesque spot in the Jura Mountains close to the frontier of Switzerland in the Department of Ain. It was designed by M. Picard, Engineer-in-Chief of the French Bridge Department, and crosses a deep rock gorge whose precipitous banks are over one hundred and seventy feet in height. The rock of the bank was employed as the abutment for the single arch which springing from the sides has a radius of 164 feet  $\frac{1}{2}$  inch at the intrados and 77 $\frac{1}{2}$  feet at the extrados. The width of the bridge is 17 feet 10 $\frac{1}{2}$  inches, increased at the coping to 28 feet 8 inches at the parapets so that there is sufficient width for two foot pavements, a railroad track and roadway parallel to the railroad track. The main arch is surmounted by eleven smaller arches on either side with circular openings of 17 feet 4 $\frac{1}{2}$  inches clear. These are carried on piers. The keystone of the main span is approximately 219 feet above the level of the water so that the erection of wooden false work from the stream to the level of the abutments was an engineering problem in itself. Three substantial towers were built of wood strongly braced together and on this the false work for the masonry arch was constructed. The work was commenced in August, 1908, and the erection of the masonry begun on August 31, 1909. The false work was removed during the remainder of that year, so that early in 1910 the bridge was ready for use. Its height, equal to that of the towers of Notre Dame in Paris, is greater than any single span masonry bridge in the world. The total cost is estimated at \$72,000.

**BRISTOL, AUGUSTA (COOPER).** An American author and lecturer, died October, 1910. She was born in 1835 and was educated in the public schools and at the Kimball Union Academy. She became a teacher. In 1866 she mar-

ried Louis Bristol. She wrote and lectured on moral and social subjects. In 1880 she went to France to study the relation of labor and capital. She nominated Benjamin F. Butler for President of the United States on the Greenback ticket and delivered the principal address at the World's Fair at Chicago before the Women's Conference. She was the author of *Poems* (1868); *The Relation of the Maternal Function to the Woman Intellect* (1876); *The Philosophy of Art* (1880); *The Present Phase of Woman's Advancement* (1880); *Science as the Basis of Morality* (1880); *The Web of Life* (poems, 1895), and *A Spray of Cosmos* (1904).

**BRISTOW, SENATOR.** See KANSAS.

**BRITISH ACADEMY.** See ACADEMY, BRITISH.

**BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.** See ADVANCEMENT OF SCIENCE.

**BRITISH COLUMBIA.** A province of Canada (since July 1, 1871). Capital, Victoria. Area, 312,630 square miles. Population (estimated 1910), 321,733. Average annual yield of industries: Minerals, \$25,800,000; lumber, etc., \$12,700,000; manufactures, \$12,000,000; fruit, farm products, and fisheries, about \$8,500,000 each. (See CANADA.) The government consists of the Lieutenant-Governor, appointed by the Governor-General of Canada, the Executive Council (responsible ministry of seven members), and the unicameral Legislative Assembly (42 members). In 1910, Lieutenant-Governor, Thomas W. Patterson (appointed December 3, 1909); Premier, A. E. Phillips.

**HISTORY.** Reports were published in June of important gold discoveries at Stewart, and a great many people left Seattle and other points to the south for the new gold fields. The question of Asiatic labor came up again in 1910. The Grand Trunk Railway petitioned the British Columbia government for permission to import Asiatic labor to work in its mining section. It agreed to employ Asiatic labor only when white labor could not be had and also to employ all the available white labor at the current rates of wages. It declared it could not continue construction for the completion of its present contracts in British Columbia unless it had recourse to Asiatic labor. The government rejected this petition. Public opinion has changed somewhat in the last few years on the Asiatic question. While the Japanese were formerly considered more desirable immigrants than the Chinese, the latter were coming to be regarded more favorably. This was attributed in part to the efficient and aggressive qualities of the Japanese, who intensified industrial conditions. Complaints were common that the Japanese were avoiding the terms of the agreement with Japan limiting immigration and that many workmen were brought in under secret arrangement. It was recognized that the exclusion of the Japanese would cost a high price, since wages ranged from \$3 to \$4 a day, but the belief that white supremacy was at stake in the matter outweighed with many persons any other consideration.

**BRITISH DEPENDENCIES.** See separate articles on colonies and dominions.

**BRITISH EAST AFRICA PROTECTORATE.** A British dependency extending from the Umba to the Juba rivers, and inland to the Uganda Protectorate. Estimated area, 177,100 square miles; estimated population, 4,038,000.

Arabs and Swahilis on the coast, Bantu-speaking tribes and Masai, Somalis, and Gallas in the interior make up the bulk of the population, which includes Asiatics to the number of 25,000. Mombasa, the largest town (30,000 inhabitants), is on Mombasa Island, which has two fine harbors, one at Mombasa, and one at Kilindini, which connects by a pier with the Uganda Railway. Nairobi, the capital, and the central station of the Uganda Railway, has 14,000 inhabitants (700 European). Paganism prevails; but Mohammedan and Christian converts are numerous. There are 3200 square miles of valuable timber (rubber, mangroves, ebony, copal, cedar, camphor, cork, iron-wood, etc.). The uplands afford extensive pasture grounds. Corn, rice, cotton, and tobacco are cultivated. Iron, mica, graphite, opals, and carbonate of soda are found. Both mining and agriculture are undeveloped. Imports and exports (1908-9), £797,158 and £436,313 respectively; in 1909-10, £775,246 and £590,057. Shipping entered (1909-10), 1,008,014 tons. The length of the Mombasa-Victoria (Uganda) Railway (State) is 584 miles; construction cost, to March 31, 1909, £5,482,670. Steamers are run on the lake in connection with the railway; and a telegraph system, with 2263 miles of wire, connects the principal towns, while a cable runs from Mombasa to Zanzibar. Revenue (1909-10), £593,040; expenditure, £669,405.

In 1908 foreign consular jurisdiction in the Zanzibar strip of coast was transferred to the British court, and the whole protectorate is now virtually a British crown colony. It is administered, under the control of the Colonial Office, by a governor (1910, Sir Percy Girouard), who is also commander-in-chief of the military forces. See *EXPLORATION, Detailed Surveys of Africa*.

**BRITISH GUIANA.** A British colony, on the northeastern coast of South America. Estimated area, 90,277 square miles; population (1891), 278,328; 1904 estimate, 301,923; 1908 estimate, 304,089. Births (1908), 8299; deaths, 9381. Capital, Georgetown, with 53,176 inhabitants. Negroes, East Indians, Europeans, Chinese, aborigines, and mixed races make up the population. The 223 schools (1908-9) had 33,888 pupils and received £25,274 in aid from the government. Of the 140,930 acres under cultivation in 1908-9, 38,000 acres were under rice, against 29,915 in 1907-8 (production, 84,851,200 pounds; of which 8,300,677 were exported and 76,550,523 were locally consumed); under sugar, 71,310 acres (amount available for export at end of 1909, 115,633 long tons). The coffee production in 1908-9 was 89,000 pounds; it has never previously reached 1000 annually in the last decade. The gold mines, which have been extensively worked for years, yielded 67,209 ounces in 1907-8, valued at £245,534. In 1908-9 diamonds (5063 carats) were exported to the value of £8486, against 1863 carats, valued at £3027, in 1907-8. Imports for 1908-9 were valued at £1,838,947; textiles, £284,273; flour, £201,350; manures, £188,581; meats, £63,976; tools, etc., £58,008. Exports, £2,104,176 (sugar, £1,257,828; raw gold, £271,300; rum, £185,852; balata, £98,128; rice, £50,064; timber, etc., £22,178). Length of railway (1909), 95 miles; length of post-office telegraphs and cables, 559 miles; canals, 12 miles; good roads, 264 miles; post-offices, 74. Tonnage entered and cleared (1908-9), 961,384. Revenue and expenditure

(1908-9), £540,053 and £539,196 respectively; 1907-8, £546,882 and £517,706. Public debt, March 31, 1909, £925,295. The two banks had, March 31, 1906, a note circulation of £117,701; the savings banks (December 31, 1908) had 28,311 depositors credited with £297,230. The colony is administered by a governor (1910, Sir Frederic Mitchell Hodgson).

**BRITISH HONDURAS.** A British crown colony in Central America, bordering on the Caribbean Sea. Area, 7562 square miles; population (1901), 37,479; estimated, 1908, 43,270. Marriages (1908), 420; birth rate 36.746 (38.62 per cent. illegitimate), death rate 23.242 per cent. per thousand. Capital, Belize, with 16,047 (estimated) inhabitants. There were 42 primary schools in 1908, with 4488 pupils, receiving £3250 in aid from the government; besides 4 receiving no aid; 5 secondary schools or departments, with 291 pupils. The highlands afford abundant pasture. Mahogany and logwood are the staple products, and bananas, coffee, plantains, etc., are grown. Imports and exports (1908-9), £558,760 and £457,970 respectively, against £496,430 and £454,370 in 1907-8. In 1908-9 mahogany to the amount of 14,398,422 superficial feet was exported; logwood, 5774½ tons; bananas, 471,600 bunches; cedar, 736,639 feet; cocoanuts 5,072,150; chicle, 1,790,865 lbs. Telegraph and telephone lines connect Belize with Corosal, Punta Gorda, and other stations. Tonnage entered and cleared (1908), 507,443. Revenue and expenditure (1908-9), £75,070 and £111,480 respectively; 1907-8, £81,210 and £106,180. Public debt (1908), £34,736. The Bank of British Honduras is located at Belize. There are 6 government savings banks with (December 31, 1908) 630 depositors credited with £14,161. The colony is administered by a governor (1910, Col. E. J. E. Swayne).

**BRITISH INDIA.** See INDIA, BRITISH; and ANTHROPOLOGY AND ETHNOLOGY.

**BRITISH NEW GUINEA.** See PAPUA.

**BRITISH NORTH BORNEO.** A British protectorate occupying the northern part of the island of Borneo. Area, about 31,100 square miles (coast line, over 900 miles); estimated population (Mohammedans, aboriginal tribes, and Chinese), 160,000. Chief towns, Sandakan (6000 inhabitants) on the east coast and Jesselton on the west. There are Catholic and Protestant missions. On the lands alienated on leases tobacco, tapioca, sago, rubber, cocoanuts, and coffee are cultivated. Coffee yield 1909, 3,000,000 lbs.; 1908, 3,000,000; 1907, 12,000,000; 1905, 50,000,000. Timber, gums, fruits, camphor, rattans, and sweet potatoes are also produced for export. Coal, iron, gold, and mineral oil are known to occur. Birds' nests, seed pearls, and beche-de-mer are exported. Imports (1909), 2,918,307 dollars Mexican; exports, 4,575,412 (leaf tobacco, 2,521,901). There are 120 miles of railway; internal telegraph and exterior cable connection; and several branch banks. Revenue and expenditure (1909), 1,803,522 and 755,323 dollars respectively. A governor (1910, E. P. Gueritz) administers the colony, under the control of the British North Borneo Company.

**BRUNEI** (area, 3000 square miles; population—Malays, Kadayans, Bisayas, Muruts, Chinese, etc.—25,000), on the northwest coast of Borneo, was placed under British protection in 1888. Chief town, Brunei (10,000 inhabitants). Ruling sultan, Mohammed Jamal-ul-alam; he re-

ceives annually from the state funds £21,000 for himself and his two ministers.

**BRITISH SOLOMON ISLANDS.** Guadalcanar, Malaita, San Cristobal, New Georgia, Yela, Tulagi, Santa Cruz, Vanicoro, Choiseul, Ysabel, Kausagi, Lord Howe's group, islands in the Bougainville Straits, and other isles and islets in the western Pacific, belonging to Great Britain. Area, 8357 square miles; population: 210 whites, 150,000 natives. Imports (1907-8), £49,252; exports, £51,602; revenue (1909-10), £11,356; expenditure, £8500. Resident-commissioner (1910), Charles M. Woodford, with headquarters at Tulagi.

**BRITISH SOMALILAND.** A British protectorate on the Gulf of Aden. Area (estimated), 68,000 square miles; population, largely Mohammedan nomads, about 300,000. Berbera, with 30,000 inhabitants in the trading season, is the chief town; Zeila has 15,000, Bulhar 12,000. Imports (rice, piece-goods, shirtings, dates, etc.) amounted in 1908-9 to £293,565; in 1909-10, to £283,648. Exports (skins and hides, ostrich feathers, gum, cattle, and sheep), in 1908-9, £227,783; in 1909-10, £206,252. Transport is by camels; there are 200 miles of telegraph lines. Tonnage entered and cleared (1908-9), 178,645. Revenue and expenditure (1908-9), £30,326 and £134,534 respectively; grant-in-aid, £89,000. The protectorate is governed under the Colonial Office by a commissioner (1910, Col. Sir W. H. Manning), who is also commander-in-chief of the military forces (local troops, supplemented by a force of 400 Indians).

In the spring of 1910 the government resolved on the evacuation of the interior of Somaliland and at the beginning of April it was reported that the evacuation was complete. This was sharply criticised by Lord Curzon as an abandonment of Imperial interests. The troops, he said, had, by their presence, maintained a local peace. The result of their withdrawal would be the breaking up of settlements, the disbandment of the local troops and a virtual violation of pledges of protection. On the other hand, it was said that the regular troops were of no use against an elusive foe like the Mullah, and that it was better to arm the natives with rifles and let them defend themselves against the enemy as best they could. Reports of an attack on eight villages by the Mullah were published at the end of November, and he was said to have carried off women, children and cattle.

**BROOKLYN INSTITUTE OF ARTS AND SCIENCES.** An educational institution in Brooklyn, New York City, incorporated in 1824 as the Brooklyn Apprentices' Library Association. It was reincorporated in 1835 as the Brooklyn Institute and again incorporated in 1890 under the present title. The membership in 1910 was 7452. The Institute carries on lectures, lecture recitals and other educational events open free to its members. The number

of these in 1910 was 570. The membership of the Institute is divided into twenty-seven departments or societies of associate members, each carrying on its own educational work. These include practically all the arts and sciences. Gifts were received by the Institute Museum of collections in art and objects of natural history and ethnology in 1910 to the value of \$158,000. The appropriation of the city for the maintenance of the Institute Museum and the Children's Museum was \$105,905. The city has appropriated, for the year 1911, \$14,550 for the maintenance of the Brooklyn Botanic Garden and arboretum in Institute Park. Attendance at the Central Museum in 1910 was 206,840; at the Children's Museum, 112,919; at the lecture recitals and concerts, 240,746, or a total of 581,515. Notable additions to the museum collections in 1910 were 130 sculptures, 7 paintings and 5 sketches by Barye, and 95 Chinese cloisonné and jades. The latter were presented by Mr. Samuel P. Avery, and the former by a number of members of the Institute who subscribed to the purchase fund. The Institute conducts a marine biological laboratory at Cold Spring Harbor during the summer months. The endowment fund in 1910 was \$457,054 and the total receipts were \$289,215.

**BROOKLYN PUBLIC LIBRARY.** See LIBRARIES.

**BROOKS, HENRY S.** A journalist and author, died April 14, 1910. He was born in England in 1831 and was educated in the University of London. He studied also at the Royal British School of Design and was gold medalist in 1849. He removed to California and was one of the pioneers of 1850. He engaged in journalistic work in 1861 and established the *California Mountaineer*, a monthly magazine. From 1862 to 1865 he was associate editor of the *Pacific Magazine*. He was at the same time manager of a gold-mining company. In 1886 he removed to New York and from that time devoted his attention to miscellaneous writings. His books include *Doña Paula's Treasure*, *A Catastrophe in Bohemia*, and *Progression to Immortality* (1902). He contributed also to magazines.

**BROWARD, NAPOLEON BONAPARTE.** An American public official, formerly governor of Florida, died October 1, 1910. He was born in Duval county, Florida, in 1857. He began work at fourteen years of age in a logging camp and later labored as a farm hand, steamboat roustabout, cod fisherman on the Grand Banks and seaman on sailing vessels and fishing boats. He became joint owner of a steamship, and later became proprietor of a wood yard. From 1890 to 1892 he was engaged in phosphate mining, and in 1895 engaged again in the steamboat business as owner of a steam tug, which from 1896 to 1898 he commanded on eight trips, conveying war material to the Cubans, then in insurrection. From 1902 to the time of his death he was engaged in business in Jacksonville, Key West and Tampa, Florida. From 1887 to 1900 he was sheriff of Duval county, Florida. He was

elected a member of the State House of Representatives in 1900, and from 1904 to 1909 was governor of the State. He received the Democratic nomination for United States Senator from Florida in the primaries held in 1910. See FLORIDA.

**BROWN, ALICE.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction*.

**BROWN, ARTHUR ERWIN.** An American naturalist, died October 29, 1910. He was born in Bucks County, Pa., in 1850, and was educated privately. He was widely known in scientific circles as a zoologist and biologist, and was a member of the Academy of Natural Sciences, of which he was curator and then president. He was secretary of the Zoological Society of Philadelphia and the active head of the zoological gardens of that city. He was corresponding member for the Zoological Society of London and wrote zoological and biological articles for journals and meetings of societies.

**BROWNELL, SIMEON.** An American Prohibitionist, abolitionist and philanthropist, died April 21, 1910. He was born in 1828. He grew up near Bennington, Vt., where he became one of the earliest anti-slavery advocates and was an active conductor of the "underground railway," which provided for the safety of fugitive slaves. He was for years owner of extensive slate quarry interests in New York and amassed a large fortune. He was active in philanthropy for over a third of a century. He was once nominated for Lieutenant-Governor of New York. He was an ardent advocate of Prohibition and was called "Old War Horse of Prohibition."

**BROWN UNIVERSITY.** An institution of higher learning at Providence, R. I., founded in 1764. There were enrolled in the several departments of the university, in 1910-11, 650 men, undergraduates, and 199 women. There were, in addition, 74 graduate students, including both men and women. The faculty numbered 78. There were no notable changes in the faculty during the year and no noteworthy benefactions were received. The John Hay library building was completed and dedicated in 1910. The total productive funds of the university amounted to about \$3,500,000 and the annual income to about \$213,000. The President is Dr. W. H. P. Faunce.

**BRYAN, EDWARD PAYSON.** American railway official, died January 23, 1910. He was born in Windsor, O., in 1850 and was educated in the public schools and in the preparatory department of Denison University. He learned telegraphy and took a place with the Louisville

and Nashville Railroad, rising to the position of superintendent. In 1895 he became vice-president and general manager of the Terminal Railway Association of St. Louis, a post which he held for five years. Under his supervision the St. Louis Terminal was built. In 1900 Mr. Bryan accepted the general management and vice-presidency of the Rapid Transit Construction Company of New York City. He held the same office with the Interborough Railway Company. In 1905 he became president of the latter company. In 1908 he retired from this position and became general manager and vice-president of the Great Western Power Company of San Francisco. From this office he resigned in July, 1909.

**BRYANT, DAVID E.** An American jurist, died February 5, 1910. He was born in Larue county, Ky., in 1849, and removed with his parents to Grayson county, Texas, in 1853. He graduated from Trinity College, N. C., in 1871 and in 1873 was admitted to the bar. He practiced law until 1890, when he was appointed United States District Judge of the eastern district of Texas, and he occupied this position until the time of his death.

**BRYCE, JAMES.** See LITERATURE, ENGLISH AND AMERICAN, *Political and Social Science*.

**BRYN MAWR COLLEGE.** An institution for the higher education of women at Bryn Mawr, Pa., founded in 1885. In 1910 there were enrolled 425 students. The faculty numbered 60. The library contains about 60,000 volumes. The productive funds of the college amounted to about \$1,200,000, and the income to about \$85,000. The president is Miss M. Carey Thomas, Ph. D., LL.D.

**BUCHLAU INTERVIEW.** See AUSTRIA-HUNGARY, *History*.

**BUCKHAM, J. W.** See LITERATURE, ENGLISH AND AMERICAN, *Philosophy and Religion*.

**BUCKHAM, MATTHEW HENRY.** An American educator, died November 29, 1910. He was born in Hinckley, England, in 1832. He was brought by his father to America in 1834. He graduated from the University of Vermont in 1851. For the two years immediately following he acted as principal of Lenox Academy, Mass. He then acted for a year as tutor of languages at Vermont University. After spending two years abroad he was, in 1859, made professor of Greek at the University of Vermont. This chair he held until he was elected to the presidency of that institution in 1871. At various times he acted also as professor of rhetoric and English literature. He remained president of the University of Vermont until the time of his death. He was widely known as a speaker on religious, social and educational themes. He received the degree of Doctor of Divinity from Dartmouth and Hamilton colleges. He received also the degree of Doctor of Laws from several universities. He was the author of numerous educational papers, etc.

**BUCK'S STOVE AND RANGE COMPANY CASE.** See BOYCOTT.

**BUCKLEY, J. M.** See LITERATURE, ENGLISH AND AMERICAN, *Political and Social Science*.

**BUCKWHEAT.** Although considered a profitable crop because it occupies the ground only a short time, can be sown as late as early summer, cleans the ground of weeds and may be plowed under for giving body to a light soil in addition to its culture for the grain, buck-

wheat remains a minor crop. It is more commonly grown in parts of Europe than in this country, but it does not occupy an important rank among crops in general. The United States produced in 1910 17,239,000 bushels of buckwheat on 826,000 acres, as compared with 17,438,000 bushels on 834,000 acres in 1909. The farm value on December 1 for the two years was 65.7 and 69.9 cents and the total value of the crop \$11,321,000 and \$12,188,000 respectively. As usual the leading buckwheat-growing States were New York and Pennsylvania. New York had an acreage of 313,000 and produced 7,199,000 bushels, and Pennsylvania with an acreage of 290,000 produced 5,655,000 bushels. These yields represent about three-fourths of the entire crop of the country. Only 24 States reported growing buckwheat, and among a number of these the acreage ranged from 1000 to 5000. North Carolina and Tennessee were the most southern States in which the crop was grown in 1910. The average yield per acre by States varied from 14 bushels in Wisconsin to 32.5 bushels in Maine.

#### BUDGET EXHIBIT. See NEW YORK.

#### BUILDING. See ARCHITECTURE.

**BULGARIA.** A constitutional monarchy of the Balkan Peninsula. Capital, Sofia.

**AREA AND POPULATION.** Estimated area, 37,199 square miles (including Eastern Rumelia, 12,585). Total population in 1905, 4,035,575; in 1908 (estimated), 4,158,409. In 1908 there were 37,016 marriages, 170,248 births, 939 stillbirths, 101,813 deaths. Sofia had (1905) 82,621 inhabitants; Philippopolis (capital of Eastern Rumelia), 45,707; Varna, 37,417.

**EDUCATION.** Primary education is free and nominally compulsory, with fees (confined to the rich) in higher grades only. Schools (1906-7), 4581 primary, with 8771 teachers and 400,308 pupils; 390 secondary, 1990 and 44,190. There are numerous foreign schools, a few special and technical schools, and a university at Sofia.

**INDUSTRIES.** In 1905 agriculture was the source of maintenance of 3,089,301 of the population (actively engaged, 1,732,612). In 1908, 2,423,000 acres were sown to wheat; yield, 1908, 36,496,000 bushels; 1909, 37,000,000 bushels. Corn (1908), 20,717,000 bushels. Under vines are 89,818 acres; yield, 1908, 63,800,000 gallons; 1909, 26,400,000. Livestock (1905): 2,167,275 cattle, 8,081,816 sheep, 536,616 horses, 124,216 asses, 11,828 mules, 1,370,201 goats, 463,241 swine. Dairy products and silk cocoons are exported. The mines (state owned) yield iron, gold, silver, lead, manganese, and copper. Woolens, cottons, cord, and cigarettes are manufactured.

**COMMERCE.** The total imports and exports are given in leva for three years:

	1907	1908	1909
Imports .....	124,661,000	130,160,000	160,430,000
Exports .....	125,595,000	112,357,000	111,434,000

Details of the trade for 1909 follow, in thousands of leva:

Imps.	1000 leva	Exps.	1000 leva
Textiles .....	49,987	Cereals .....	67,885
Metals, etc. ....	19,284	Animal prods. ....	12,283
Machinery .....	17,055	Textiles .....	9,070
Col. prods. ....	8,018	Animals .....	6,729
Skins, etc. ....	7,597	Perfumes .....	5,372
Timber, " .....	5,637	Skins, etc. ....	4,451
Resins, " .....	5,237	Col. prods. ....	1,693
Chem. prods. ....	5,189	Metals, etc. ....	801

Principal countries of origin and destination: Austria-Hungary, imports, 38,867,000 leva, exports, 11,778,000; Germany, 29,215,000 and 13,523,000; Great Britain, 27,010,000 and 8,279,000; Turkey, 21,084,000 and 36,652,000; France, 11,165,000 and 5,045,000; Belgium, 7,902,000 and 19,341,000; Russia, 5,802,000 and 210,000; Italy, 5,489,000 and 2,732,000; Rumania, 5,049,000 and 621,000. Vessels entered (1909), 14,113, of 3,339,657 tons; cleared, 14,104, of 3,335,380.

**COMMUNICATIONS.** Railways in operation (1910), 1908 kilometres (state owned); under construction, 303. Length of state telegraph lines, 5900 kilometres; wires, 12,390; telephone lines, 1922; wires, 8397; telegraph offices, 295; post-offices, 2070.

**FINANCE.** The unit of value is the lev, worth 19.3 cents. In 1907 the revenue and expenditure amounted to 149,515,231 and 115,658,812 leva respectively. The details of the budget for 1910 are given below in thousands of leva (total revenue, 172,248,400; expenditure, 172,079,096):

Rev.	1000 leva	Expend.	1000 leva
Direct taxes .....	45,200	War .....	39,773
Customs, etc. ....	57,780	Debt .....	38,780

Domains .....	11,442	Instruction .....	21,670
Licenses, etc. ....	8,855	Interior .....	9,660
Imports .....	8,896	Commerce, etc. ....	9,296
Fines .....	1,031	Finance .....	8,622
Other .....	10,549	For. Affairs. ....	6,395
		Justice .....	5,523
Total .....	172,248	Other .....	1,782
		Total .....	172,079

Public debt, January 1, 1910, 478,895,884 leva.

**NAVY.** The navy includes 6 torpedo boats of 100 tons each, 2 of 20; 1 transport; 2 yachts; 1 cruiser of 735 tons. Personnel (1910), about 1000 officers and men.

**ARMY.** The Bulgarian army in 1910 was one of the most efficient on the continent of Europe, being maintained in constant readiness for service. Military service is universal and compulsory between the ages of 18 and 40, and two years must be spent with the colors in the case of the infantry and three for the cavalry and artillery. The men so trained then pass into a reserve, where they are enrolled until their military service is ended. Of the 80,000 candidates available each year, 24,000 in 1910 formed the contingent, and of these 18,000 passed into the infantry, 2000 into the cavalry and 2300 into the artillery. The second contingent of 10,000 men were incorporated into the infantry for six months' service. The active army in 1910 amounted to 57,464 officers and men, of whom 1024 were in the naval service. There are nine divisions with headquarters at Sofia, Philippopolis, Sliven, Schumla, Rustchuk, Vratza, Dubnitza, Eskizagora and Plevna. Each division had two brigades made up of four regiments and generally nine batteries, while six of the divisions had cavalry regiments. The cavalry strength in 1910 was being increased to ten regiments. Each of the infantry regiments has a machine-gun section. The artillery were armed with Schneider-Canet field-guns and Krupp mountain-guns, which were being handled with great skill. The infantry were armed with the Männlicher rifle and carbine. There was also a complete equipment for the technical troops and the transport service. A military

school is maintained at Sofia, where the officers are educated.

**GOVERNMENT.** The executive authority rests with the king (since October 5, 1908), acting through a council of eight ministers. The legislative power is vested in a single chamber, the *Sobranje* (National Assembly), whose members are elected by universal manhood suffrage. Reigning sovereign (1910), Ferdinand, born February 26, 1861; elected, July 7, 1887; married (1), April 20, 1893, Princess Marie Louise of Parma; (2) February 28, 1908, Princess Eleonore of Reuss-Köstritz; proclaimed King of the Bulgarians, October 5, 1908. Heir-apparent, Prince Boris, born January 30, 1894. The ministry in 1910 was composed as follows: President of the Council and Minister for Foreign Affairs, Al. Malinoff; Interior, N. Mushanoff; Finance, A. Liapcheff; Instruction, Vl. Mulloff; Justice, Chr. Slaveikoff; War, General Nicolaieff; Commerce and Agriculture, Dr. T. Kresteff; Public Works, etc., M. Takeff.

**HISTORY.** Prince Ferdinand, it will be remembered, had proclaimed the independence of Bulgaria on October 5, 1908, and assumed the title of King. Then followed the negotiations concerning an indemnity which finally resulted in an agreement, April 19, 1909, wherein all differences were settled and Turkey acknowledged Bulgarian independence. During 1910 there was at times serious friction between Turkey and Bulgaria. Early in the year there were rumors of trouble on the Turkish frontier and even of war preparations, and the situation was watched with anxiety. On March 13 a riot occurred as the result of an elopement of a young Moslem girl with a Bulgar, at Rustchuk, in which 15 persons were killed and many wounded. During the summer there were many outrages in Macedonia, committed chiefly against the Bulgars, and there were bitter complaints of Turkish persecutions. In August a mass-meeting was held at Kostendil to protest against the persecution of the Bulgars by the Turkish authorities. A large number of refugees poured into Sofia during August and in the following month their number had risen to 1400. The Turkish Minister guaranteed them safe conduct to their homes, but only a few ventured to avail themselves of it. The Bulgarian government protested sharply against these outrages and there was a diplomatic correspondence between the two countries. The Bulgarian government demanded amnesty for those who had taken part in the recent revolution, restoration of lands that had been illegally seized and the punishment of officials who had acted illegally. In September the Premier, M. Malinoff, presented his resignation owing to opposition to the government's Macedonian policy, and also to charges of bribery and corruption brought against the Minister of the Interior. He became, however, the Premier of the new Ministry as reorganized. The criticism of the Opposition on the Macedonian question was to the effect that the government had not taken the proper course to avert trouble with Turkey. To this M. Malinoff replied on November 7, saying that the reason the relations with Turkey were not as friendly as they should be was because the Ottoman government had not displayed the same friendly spirit that was shown by the Bulgarian government in its communications. The latter had repeatedly shown its friendly intentions and had taken no

advantage of the difficulties in the way of the new régime. Its spirit had been conciliatory on all controverted questions.

**BURGESS, GAVEN D.** An American jurist, died December 17, 1910. He was born in Mason county, Ky., in 1835 and was educated in the common schools of the State. He engaged in the practice of law. From 1874 to 1892 he was judge of the 11th and 12th judicial districts of Missouri. In the latter year he was appointed Associate Justice and acted as Chief Justice in 1901-3. He was a Democrat in politics.

**BURGESS, NEIL.** An American actor, died February 18, 1910. He was born in 1847 and was originally a vaudeville performer. One of his earliest parts was that of Widow Bedott in the play of that name made from the famous Widow Bedott papers. His greatest success, however, was in the play *The County Fair*, which he wrote himself and in which he played the leading part for many years in all parts of the United States.

**BURWELL, WILLIAM TURNBULL.** A rear admiral, retired, of the United States Navy, died January 4, 1910. He was born at Vicksburg, Miss., in 1846, and graduated from the United States Naval Academy in 1866. He rose through successive ranks to that of captain in 1900, and rear admiral in 1906. He served on the Asiatic Station, at the Naval Academy, at the Norfolk Navy Yard and as lighthouse inspector. On his command as captain he was assigned to the Puget Sound Navy Yard. After two years' service there he was placed in command of the battleship *Oregon*, and after a year's command of the *Independence* he returned to the Puget Sound Yard. During his service there the yard was changed from a straggling naval station into a well-equipped yard.

**BUTCHER, SAMUEL HENRY.** An English classical scholar and educator, died December 29, 1910. He was born in Dublin in 1850 and was educated at Marlborough School and at Trinity College, Cambridge. He was made a fellow of Trinity College in 1874. Vacating this by marriage in 1876, he was elected without examination to a fellowship at University College, Oxford, where he remained as lecturer un-

til 1882. In that year he became professor of Greek in the University of Edinburgh, remaining until 1903. From 1889 until 1896 he was a member of the Scottish Universities Commission. He was also a member of several other commissions on universities in England and Scotland. In 1906 he became a member of Parliament from Cambridge University. Among his published works are *Prose Translation of the Odyssey* (with Andrew Lang, 1879); *Some Aspects of the Greek Genius* (1891, 1893 and 1904); *Aristotle's Theory of Poetry and the Fine Arts* (1895, 1897 and 1903); and *Harvard Lectures on Greek Subjects* (1904).

**BUTLER, ARTHUR JOHN.** An English scholar, died February 26, 1910. He was born in 1844 and was educated at Eton and Trinity College, Cambridge. From 1870 to 1887 he was employed in the Education Department of the government. From 1887 to 1894 he was engaged in the publishing business. In 1894 he was appointed assistant commissioner to the commission on secondary education. He was well known in England as an Italian scholar, and his edition of the three parts of Dante's *Divine Comedy*, consisting of the text, translation and commentary, was widely used. He was professor of the Italian language and literature in the University of London. Among other works on Dante, he wrote a volume for beginners, entitled *Dante: His Times and His Work*. He translated Scartazzini's *Companion to Dante*. He edited also memoirs of General Marbot and General Thiébauld, and edited the *Calendars of Foreign State Papers from 1577*. He assisted his sister, Mrs. Knight, in writing the *Life and Letters* of his father, W. J. Butler, Dean of Lincoln.

**BUTLER, E. B.** See LITERATURE, ENGLISH AND AMERICAN, *Political and Social Science*.

**BUTLER, SIR WILLIAM FRANCIS.** An English soldier and writer, died June 7, 1910. He was born in 1838 and was educated at the Jesuit schools in Dublin. In 1858 he entered the 69th Regiment and served nearly four years in the East. He saw service in Canada in 1870 during the Fenian raid and the Red River expedition, and was awarded a medal for his services. In 1870-71 he was special commissioner to the Indian tribes of the Saskatchewan River. In 1873-4 he served in Africa and was again awarded a medal for his services. In 1875 he served with Sir Garnet Wolseley in Natal. He took part in the Zulu War, 1879-80, and in the Egyptian War in 1882. From 1882-1892 he was aide to Queen Victoria. He took part in the Nile Expedition of 1884-85 and in the latter year commanded mounted troops in the Sudan. In the same year he was made brigadier-general of a frontier field force and in the following year commanded at Wady Halfi. He was promoted to be major-general in 1892, and from 1893 to 1896 commanded the Second Infantry Brigade at Aldershot. He held various commands from that time until 1905. In 1901 he was made lieutenant-general. Among his published works, which had great popularity among English readers, are *The Great Lone Land* (1872), *The Wild Northland* (1873), *Far Out* (1880), *Red Cloud, the Solitary Sioux* (1882), *The Campaign of the Cataracts* (1887), *Charles George Gordon* (1889), *Sir Charles Napier* (1890), *Life of Sir George Pomeroy Colley* (1899) and *From Naboth's Vineyard* (1907).

**BYRNES, THOMAS.** An American detective, died May 7, 1910. He was born in New York City in 1842. He learned the trade of gas fitting and followed it until 1861. He enlisted in the Ellsworth Zouaves and went to the war. In 1863 he joined the police force of New York City and rapidly made his way to the top, being made captain in 1870, inspector in 1880, superintendent in 1892, and chief of police in 1895. He early made a reputation as a detective, but it was not until he became a captain that he did the first piece of detective work that made him famous. This was the capture of the Manhattan Savings Bank robbers and the recovery of a large amount of bonds stolen by them. Shortly after this he was transferred to police headquarters and put in charge of the Detective Bureau, which had become disorganized. Byrnes at once detailed a number of his men for special duty in the financial district, with orders to arrest every known criminal below Fulton Street. He soon built up a detective force which became a terror to criminals. His most effective method was in keeping close track of criminals, and in doing this he was accustomed to spend a portion of each day in the company of thieves. As chief of the Detective Bureau he obtained from the legislature certain powers which made him independent even of the police commissioners. As superintendent of police he was constantly in trouble with the police commissioners and with societies organized to look after police methods. Investigations carried on by the Lexow Committee, which disclosed great corruption in the police department, did not smirch Byrnes' personal reputation. As superintendent, he broke up a strong association of precinct wardmen who, he had reason to believe, were the real masters of the precincts. As head of the uniformed force, he broke up the pool rooms in the city, as well as the green-goods business, which was then flourishing. He was thirty-two years in the service of the police department and was probably the most widely known detective of his day. He wrote a book giving the biographies of the best-known criminals of the world, which remains the standard work of this sort.

**CALIFORNIA.** One of the States in the Pacific Division of the United States. It has an area of 158,297 square miles, of which 2205 square miles are water. Its capital is Sacramento.

**POPULATION.** The population of the State in 1910 according to the Thirteenth Census was 2,377,549, as compared with 1,485,053 in 1900 and 1,213,398 in 1890. The increase in the decade 1900 to 1910 was 60.1 per cent. The State ranks twelfth in point of population, whereas in 1900 it ranked twenty-first. The population of the chief cities and towns of the State will be found in the tables under UNITED STATES CENSUS. San Francisco, in spite of the dis-

aster of the fire of 1906 which destroyed the greater part of the city, increased in population from 342,782 in 1900 to 416,912 in 1910, an increase of 21.6 per cent. The percentage of increase from 1890 to 1900 was 14.6.

**MINERAL PRODUCTION.** California is first of the States in the importance of its mineral products. As a producer of gold it has been notable since the discovery of gold in 1848. While the yearly production has fallen off from the great totals of the first fifteen or twenty years, it shows a remarkably even rate in the value of the gold produced. The production in 1910, according to the preliminary figures of the Director of the Mint, was 21,146,150 fine ounces, as compared with 20,703,600 fine ounces in 1909. This gives California the first place in the production of gold which it held before it was outranked by Colorado in 1909. With the year 1909 California took first place in the production of petroleum, the increase over the production of the preceding year being more than 8,500,000 barrels. The total production was 54,433,010 barrels as compared with 44,804,737 barrels in 1908. The value of the product of 1909 was \$30,675,267 as compared with a value for the product of 1908 of \$23,433,502. The average price per barrel in 1909 was 56.4 cents against 52.2 cents in 1908. One of the most important events in the oil history of the year was the drilling in September of the Silver Tip well on Section 6 of the Coalinga field. This was at the time the greatest well ever drilled in the State. It was exceeded in 1910, however, by the Lake View gusher. To care for the petroleum production a vast system of pipe lines has been constructed, and of these, four are in operation in the Coalinga field. In March, 1910, the Producers' Transportation Company completed and put into operation an 8-inch pipe line from Coalinga to Port Harford, about 100 miles in length. The total number of wells drilled in 1909 was 638, of which 578 were productive and 60 were dry. The total number of productive wells on January 1, 1909, was 3762. The production of petroleum in California in 1910 aggregated between 65,000,000 and 70,000,000 barrels, according to the estimates made by the Geological Survey at the end of the year.

The coal mining industry of California is not of great importance. The total production in 1909 was 45,836 tons, having a spot value of \$95,042, an increase of 27,081 tons in quantity and \$54,840 in value over the production of 1908. The increase in production was due entirely to the operations of a single company in Monterey county. The remainder of the output came from Amador and Riverside counties. The development of the bituminous coal mines in the State has been held back by an enormous increase in the production of petroleum and by its use by transportation and manufacturing industries. This has practically eliminated coal as a steam raising fuel in the State. The product in 1910 did not exceed that of 1909.

The silver production of the State is considerable and amounted in 1910 to 3,530,246 fine ounces, as compared with a production of 2,304,900 fine ounces in 1909. The production of copper ore in 1910 amounted to 53,568,708 lbs., as compared with 39,643,835 lbs. in 1909. The output of copper in 1910 showed a considerable decrease. This was due to the reduction of the number of operating smelters in consequence of legislation controlling the smelter fumes in

Shasta County. The fumes had been the subject of much public complaint in recent years. A small quantity of lead is produced, amounting in 1909 to 937 tons. The State produces large quantities of mineral water and stone, and the greater portion of the asphalt produced in the United States is derived from California. Other important products are borax, clay products and natural gas. Precious stones are mined more extensively in California than in any other State. The reports of the United States Geological Survey indicate an increase in value in the gold production of the State of over \$400,000 in 1910 over the production of 1909.

**AGRICULTURE.** The acreage, production and value of the principal crops in 1909-10 are shown in the following table:

		Acreage	Production	Value
Corn,	1910....	49,000	1,838,000	\$1,470,000
	1909....	50,000	1,740,000	1,583,000
Winter wheat,	1910....	950,000	17,100,000	16,074,000
	1909....	925,000	11,500,000	12,820,000
Oats,	1910....	825,000	8,325,000	4,162,000
	1909....	200,000	6,280,000	4,145,000
Barley,	1910....	1,400,000	43,400,000	23,870,000
	1909....	1,180,000	31,270,000	23,140,000
Rye,	1910....	58,000	986,000	848,000
	1909....	61,000	842,000	876,000
Rice,	1910....	100	3,000	2,000
	1909....	62,000	8,060,000	6,851,300
Potatoes	1910....	60,000	7,800,000	6,006,600
	1909....	700,000	1,281,000	12,298,000
Hay,	1910....	650,000	1,105,000	12,708,000
	1909....			

In the production of barley California ranks second, being surpassed only by Minnesota. The crop in 1910 was considerably in excess of that of 1909, as will be seen in the table above. The value of the crop, however, amounted to about the same. The oat crop in 1910 also surpassed that of 1909, while in this case the value remained about identical. The corn crop of 1910 was slightly in excess of that of 1909, while the crop of winter wheat in 1910 was nearly 6,000,000 bushels more than that of 1909 and its value was nearly \$4,000,000 greater. Nearly all crops show an increase. The production of citrus fruits in the State has steadily increased in the last few years and is now one of the most important of these industries (see **HORTICULTURE**). The State ranks second in the production of beet sugar.

**EDUCATION.** The total enrollment in the schools of the State for the year ending June 30, 1909, the latest year for which statistics are available, was 349,145. Of these 180,481 were boys and 170,664 were girls. In the high schools there were 334,298 and in the kindergarten schools, 5758 pupils. The total number of teachers was 10,769, of whom 1466 were men and 9303 women. The high schools of the State have shown great gain in the last few years, since the provision for State aid for each school.

**FINANCE.** There was in the State treasury on January 30, 1909, \$7,607,863. The total receipts for the fiscal year amounted to \$19,253,754; the total payments during the same period amounted to \$19,660,397, leaving a balance on June 30, 1910, of \$7,201,219. The receipts and payments for the biennium 1908-10 were far in excess of those of the two preceding years. The total bonded indebtedness and warrants outstanding on June 30, 1910, amounted to \$5,184,570. Of this the bonded indebtedness amounted to \$4,881,500.

**CHARITIES AND CORRECTIONS.** The charities and corrections of the State are in the hands of a State Board of Charities, consisting of six members. This board has general supervision and jurisdiction over the charitable and correctional institutions of State, county and municipality. There are two State prisons under the direct management of a board of five prison directors appointed by the Governor. There are five hospitals for the insane in various parts of the State. Over these a general commission in lunacy has supervision. Under this commission is also the Sonoma State Home, an institution for the feeble-minded. An industrial home for the adult blind is managed by a local board of five directors, as is also the institution for the education of the deaf and blind.

The average number of inmates in the State prisons in the fiscal year 1910 was 2844; in the reform schools, 756; in the insane hospitals, 6668; in the Sonoma State Home, 807; in the Home for the Adult Blind, 110; and in the institution for the Deaf and Blind, 251. A new cell house with a capacity of 800 cells was under construction during the year at the San Quentin prison and will be ready for occupancy in the first part of 1911. The reform schools are trade schools in which agriculture plays a prominent part. The State gives unusual attention to the care of its insane. New treatment buildings have been erected at all the State hospitals. These provide for the most modern treatment. The new insane hospital at Agnew will contain twenty-three buildings, each building planned and equipped for the care of certain classes of insane.

**POLITICS AND GOVERNMENT.** There was no session of the legislature in 1910, as the sessions are biennial, and the last was held in 1909. The next session begins January 2, 1911.

**CONVENTIONS AND ELECTIONS.** A new primary law went into effect in 1910 and primaries for the nomination of State officers and candidates for Congress were held on August 16. The campaign both for the primaries and for the election of November was unusually warm. The insurgent element of the Republican party developed great strength in the State, and Hiram Johnson, who was nominated for Governor at the primaries held on August 16, was allied throughout the contest with the insurgents or progressives. The fight in the State, however, was rather on local than on national issues. The anti-railway sentiment, chiefly directed against the alleged control of the State by the Southern Pacific Railroad, took a large part in the nomination of Mr. Johnson, who promised that in the event of his election railway domination over the politics of the State should cease. He was also supported by that wing of the Republican party of the State which was strongly committed to conservation policies. In three of the congressional districts, insurgent candidates were nominated. Mr. William Kent, the donor of the National Redwood Park near San Francisco, received a decided majority in the second district over Congressman Duncan McKinlay, and Judge John D. Works, who had the indorsement of the progressive Republicans, was nominated for United States Senator.

In the Republican Convention, held on September 6, the insurgents were in a large majority. The only function of the convention was to provide a platform and select the State Committee, as the nomi-

nations had already been made by the direct primary system. The insurgents were in full control of the convention, and the platform indorsed President Taft and declared adherence to the Roosevelt policies, already enacted in part under the Taft administration. It condemned the present method of framing the tariff bills and approved the demand for a permanent tariff commission. The national progressive movement was indorsed and the domination of corporations in politics was condemned. The election of United States Senators by direct vote was advocated and conservation was strongly indorsed. One of the interesting planks of the platform was the one which promised to submit to the voters of the State a woman suffrage amendment to the constitution. At the election in November, 1908, Hiram W. Johnson and the entire Republican State ticket were elected by a large majority. All of the Republican nominees for Congress were elected except in the First Congressional District, where John E. Raker, the Democratic candidate, defeated William F. Englebright, the Republican candidate, by 134 votes. The State legislature is overwhelmingly Republican and will undoubtedly elect a progressive Republican to succeed Senator Flint, who announced on February 5, 1910, that owing to personal reasons and also to conditions created by the new State primary law he would not be a candidate for re-election.

**OTHER EVENTS.** Among the measures voted on in the election in November was one providing for the taxation of the State for \$5,000,000 for the Pan-American-Pacific Exposition to be held in 1915. The measure received more than 100,000 votes over the majority necessary to pass it. A vigorous campaign was carried on throughout the year for the selection of San Francisco as the site for this exposition. The amendment gave San Francisco power to amend the city charter and vote a bond issue of \$5,000,000 for the exposition. An exposition fund of more than \$12,000,000 was raised during the year by subscription and otherwise, and in addition to this \$5,000,000 in bonds were voted by San Francisco to bring the total amount assured up to \$17,500,000. This fund insures that the State will not be obliged to ask for government aid, if it is successful in securing the exposition.

**SAN FRANCISCO.** The notorious prize fight between James J. Jeffries and John J. Johnson which was planned to have been held in San Francisco on July 4, was forbidden by Governor Gillett, who on June 15 ordered the Attorney-General to take measures to prevent the fight being held in San Francisco. The action of the Governor was hastened by a communication received from the Chairman of the Foreign Affairs Committee of the House of Representatives warning him that San Francisco need not hope to secure the Panama fair if the fight was held in that city. This action was seconded by despatches from California Congressmen and Senators. The action of Governor Gillett was received with general satisfaction throughout the country.

As a result of the investigation made by the Japanese Consul-General at San Francisco, it was shown that during the last few years the number of Japanese returning to their own country from the United States was greater

than the number of those coming from Japan to the United States. In 1908 the excess of those returning to Japan over those coming to the United States was 1667 and in 1909 the excess was 2625, while for 1910 the proportion appeared to be about the same. The number of Japanese in California was, in round numbers, 40,000.

Although there were no active measures taken in the prosecutions against Patrick Calhoun and others for alleged corruption in securing railway franchises in San Francisco, there were echoes of previous proceedings in the courts during the year. The trial of Mr. Calhoun in 1909 resulted in a disagreement of the jury, ten voting for acquittal and two for conviction. Preparations for a new trial were at once begun, but as a result of the municipal elections held on November 2, 1909, conditions were brought about which appeared to indicate that the sentiment against further trial in these cases was strong. In August, 1910, an attempt was made to have 17 indictments for bribery against Calhoun dismissed, but Judge Lawler refused such action, declaring that he believed Calhoun had bribed a material witness to stay outside the State. He was thereupon accused by Calhoun's lawyers of "dirty politics" and these lawyers, three in number, were by him committed to jail for contempt of court. The report of the District Court of Appeals in November affirmed the findings in the case of Abraham Ruef, whereby he was sentenced to fourteen years in prison for bribery. He was convicted in December, 1910, but remained out of jail on bail for nearly a year. On November 18 the Appellate Court declared that he might enjoy his liberty under \$350,000 bail until his appeal was decided upon by the United States Supreme Court. Former Mayor Schmitz, who was convicted of extortion and was sentenced to seven years' imprisonment in 1908, escaped on a technicality. He has not been prosecuted on any other of the indictments against him and still remains in San Francisco.

The result of the census showed a remarkable gain in San Francisco in the decade 1900-1910, in spite of the disaster of 1906, which destroyed the greater part of the city. The population in 1910 was 416,912 as against 342,782 in 1900, a gain of 21.6 per cent. The city is practically rebuilt.

**STATE OFFICERS:** Governor, H. W. Johnson; Lieutenant-Governor, A. J. Wallace; Secretary of State, F. C. Jordan; Treasurer, W. R. Williams; Comptroller, A. B. Nye; Adjutant-General, V. S. Webb; Attorney-General, J. B. Lauck; Superintendent of Education, William Hyatt; Commissioner of Insurance, E. C. Cooper; Commissioner of Agriculture, J. B. Jeffrey—all Republicans.

**JUDICIARY:** Supreme Court: Chief Justice, W. H. Beatty; Associate Justices, H. Melvin, Lucien Shaw, F. M. Angellotti, M. C. Sloss, F. W. Henshaw, W. G. Lorigan; Clerk, F. L. Caughey—all Republicans.

**STATE LEGISLATURE, 1911.** Republicans, Senate, 31; House, 68; joint ballot, 99. Democrats, Senate, 9; House 12; joint ballot, 21. Republican majority, Senate 22; House, 56; joint ballot, 78.

**CALIFORNIA, UNIVERSITY OF.** An institution of higher learning at Berkeley, California, founded in 1868. The students enrolled in the several departments of the Uni-

versity in 1910-11 numbered 4909, including the summer session. The faculty numbered 297. Among the notable changes in the faculty during the year were the following: Dr. David P. Barrows, formerly Director of Education for the Philippine Islands, was appointed professor of Education; Professor Lucien Foulet, formerly professor of French Literature in Bryn Mawr College, was appointed professor of the French Language and Literature; Dr. Frederick P. Gay, formerly assistant professor in the Harvard Medical School, was made professor of Pathology; Mr. Harold L. Leupp, formerly superintendent of the Library Department and librarian of the Historical Group at the University of Chicago, was appointed assistant librarian; Dr. Rudolph Shevill, formerly assistant professor of Spanish at Yale University, was appointed professor of Spanish. Among the noteworthy benefactions were those of Mrs. Phoebe A. Hearst, for scholarships, anthropology, equipment of the Hearst Memorial Mining Building and of the Greek Theatre, total, \$6000; of the Carnegie Institution for the Lick Observatory, \$1666; of William H. Crocker for the Mount Whitney expedition, \$1080; of the estate of D. O. Mills, for the support of the Southern Hemisphere expedition from the Lick Observatory, \$6000; of Miss Annie M. Alexander for the California Museum of Vertebrate Zoölogy, \$10,081; of M. Theodore Kearney, a bequest of \$1,000,000, this being the valuation of 5400 acres of land near Fresno, including buildings and farm equipment. Among the gifts for endowment received were those of Professor Albert S. Cook, \$1000; the income thereof to be used as an annual prize for a poem, to be known as the Emily Chamberlain Cook prize; of Mrs. Martha C. Lebus, in pursuance of her daughter's will, \$4000 as an endowment for the University Hospital; and of Mrs. James Horburgh, Jr., \$15,000, to be known as the Sheffield-Sanborn Scholarship Fund, for the support of one scholarship in medicine and two in law. There were also received from the estate of Mrs. Jennie D. Thompson of Salt Lake City \$3049 in cash and about \$53,000 in real estate, to be used as a scholarship fund for the maintenance of scholarships for the students from Utah at the University. The productive funds on June 30, 1910, amounted to \$4,462,779 and the income of the college for the year ending at the same date was \$240,731. The president is Benjamin Ide Wheeler.

**CALIFORNIA EARTHQUAKE.** See EARTHQUAKES.

**CALL, WILKINSON.** An American public official, United States Senator from Florida, 1879-1897, died August 25, 1910. He was born at Russellville, Ky., in 1834. While still a youth he removed to Florida and served as adjutant-general in the Confederate Army during the Civil War. He engaged in the practice of law at Jacksonville. In 1865 he was elected Senator by the Florida legislature, but was not seated. In 1872-76 he was presidential elector at large, and in the latter year was a member of the Democratic National Executive Committee and a delegate to the Catholic bishop, died April 6, 1910. He was elected United States Senator in 1879 and was elected for successive terms until 1897.

**CAMBODIA.** A French protectorate in French Indo-China (q. v.). Area about 45,000

sq. miles, including about 7000 sq. miles acquired from Siam by the Franco-Siamese treaty of March 23, 1907. Population (1906), 1,193,534. Capital, Phnom-Penh, with 50,000 inhabitants. Rice, betel, tobacco, indigo, pepper, corn, cinnamon, coffee, and cotton are grown. Salt is mined, and at Khsach-Kandal are factories for the shelling of cotton seeds. Imports for home consumption (1908), £186,203; domestic exports, £44,012. The external trade is principally through Saigon in Cochinchina. The budget (including 525,000 dollars for the civil list) is estimated at 2,588,135 dollars Mexican. Sisowath (since 1904) is the present king; M. Luce (1910), the French resident-superior.

**CAMERON, A. D.** See LITERATURE, ENGLISH AND AMERICAN, *Travel and Description*.

**CAMERON, JOHN.** A Canadian Roman Catholic bishop, died April 6, 1910. He was born in 1826 in the eastern part of Nova Scotia. He was of Presbyterian parentage, but he entered the Roman Catholic Church, and in 1870 was consecrated bishop of the eastern diocese of Nova Scotia. He is said to have been the oldest Roman Catholic bishop in America.

**CAMEROON.** See KAMERUN.

**CAMPAIGN OF 1910.** See UNITED STATES, *Campaign and Election*.

**CAMPBELL, Mrs. PATRICK.** See DRAMA.

**CAMPBELL, T. J.** See LITERATURE, ENGLISH AND AMERICAN, *Biography*.

**CAMPFIRE.** See CHEMISTRY, INDUSTRIAL.

**CANADA, DOMINION OF.** A British possession in North America. Capital, Ottawa.

**AREA AND POPULATION.** The following table shows: (1) area in square miles, inclusive of 125,756 square miles of water area, but exclusive of the territorial seas, the Gulf of St. Lawrence, and the Canadian portion of the Great Lakes; (2) population according to the census of 1901; (3) population according to the official estimate of March 31, 1910:

Provinces	Area	Pop., 1901	Pop., 1910
Pr. Edward Island.	2,184	103,259	
Nova Scotia .....	21,428	459,574	1,060,678
New Brunswick ..	27,985	331,120	
Quebec .....	351,873	1,648,898	2,124,834
Ontario .....	260,862	2,182,947	2,687,861
Manitoba .....	73,732	255,211	496,111
British Columbia ..	312,630	178,657	321,733
Alberta .....	253,540	72,841	321,862
Saskatchewan .....	250,650	91,460	377,590
<b>Territories:</b>			
Keewatin .....	516,571	9,800	
Yukon .....	196,976	27,219	
Mackenzie .....	562,182	5,216	59,050
Ungava .....	354,961	5,113	
Franklin .....	500,000		
Immigration not included above..			10,862
<b>Total .....</b>	<b>3,745,574</b>	<b>5,371,315</b>	<b>7,489,781</b>

The total estimated population, March 31, 1909, was 7,184,000; July 1, 1908, 6,940,504; July 1, 1907, 6,655,904. A special census of the Northwest Provinces taken June 24, 1906, showed a population of 808,863 (against 419,512 in 1901) distributed as follows: Manitoba, 365,688; Alberta, 185,412; Saskatchewan, 257,763. In 1910, the larger municipal populations, including suburbs, were estimated as follows: Montreal, over 500,000; Toronto, over 380,000;

Ottawa, 100,000; Winnipeg, over 130,000; Vancouver, over 110,000.

Immigration for years ending June 30:

Country or origin	1905	1908	1909
United Kingdom .....	65,359	84,351	47,580
Europe (and Iceland)....	37,255	62,860	32,142
United States .....	43,652	56,860	72,349
<b>Total .....</b>	<b>146,266</b>	<b>204,071</b>	<b>152,071</b>

For the year ending March 31, 1910, immigration was 208,794 (59,790 from the United Kingdom, 45,206 from Europe, and 103,798 from the United States). Immigration from the United States is directed principally to the Northwest Provinces. In the fiscal year 1909, Chinese immigrants numbered 2234; 1910, 2106.

**EDUCATION.** Public instruction is controlled by the separate provincial governments. In the provinces primary instruction is free and, except in Quebec and Manitoba, compulsory. In 1901 the inhabitants of five years of age and over numbered 4,728,330, of whom about 3,918,000 were reported as able to read and write, 129,584 to read only, and 680,132 not to read. Educational statistics by provinces follow:

**Alberta.** In 1908, there were 851 schools (including nine separate schools for Roman Catholics), with 1192 teachers and 39,653 pupils. Expenditure, \$2,636,835.

**British Columbia.** For the year ending June 30, 1909, the total enrollment in all public schools was 36,227 (18,659 boys, 17,568 girls), an increase of 2913 over the previous year; average daily attendance, 25,350; percentage of regular attendance, 69.97; teachers, 911, an increase of 95; expenditures, of the provincial government, \$626,074, including \$532,810 for education proper and \$93,264 for new school houses, repairs, furniture, etc. In addition school districts and incorporated cities expended \$921,628, making the total cost of public instruction for the year \$1,547,700. In detail: Rural and assisted schools, 240, with 7468 pupils and 262 teachers; rural municipality schools, 25, with 7024 pupils and 199 teachers; graded city schools, 52, with 19,797 pupils and 380 teachers; high schools, 18, with 1809 pupils and 59 teachers; branches of McGill University College, one in Vancouver with 108 students, the other in Victoria with 21 students, total teachers, 11.

**Manitoba.** In 1907, there were 1943 public schools, with 2480 teachers and 67,144 pupils (including seven high schools, with 3870 pupils). Expenditure, \$2,734,000.

**New Brunswick.** On June 30, 1909, there were 1854 public schools, with an enrollment of 61,937, average attendance 41,438, and 1942 teachers (251 males). Expenditure, \$829,710, of which \$539,002 was voted at school meetings, etc., \$91,235 from county school funds, and the remainder provincial grants. These statistics apply to primary and grammar schools.

**Nova Scotia.** On July 31, 1909, there were 2577 public schools, with an enrollment of 103,970 (average attendance about 70 per cent.) distributed as follows: Common schools, 93,556; high schools, 8124; technical schools, 2145; government night schools, 145. Teachers in common and high schools, 2694, of whom 352 were males. Expenditure, \$1,199,887, of which \$341,058 was contributed by the province.

**Ontario.** Statistics for 1908: 1. Elementary schools, (a) Public schools: Number, 5869; pupils enrolled, 399,670; average daily attendance, 237,933 (59.53 per cent.); teachers (exclusive of kindergarten and night school teachers), 9020 (men, 1760); total expenditure, \$7,182,234. (b) Roman Catholic separate schools: Number, 465; pupils enrolled, 53,551; average attendance, 34,257 (63.97 per cent.); teachers, 1065; total expenditure, \$761,592. (c) Protestant separate schools: Number, 6; pupils enrolled, 422; average attendance, 243. (d) Kindergartens: Number, 156; pupils enrolled, 16,477; average attendance, 6020; teachers, 288. (e) Night schools (1908-9): Number, 10; pupils enrolled, 889 (a decrease of 663); average attendance, 208; teachers, 18. 2. Secondary schools, (a) High schools: Number (including 42 collegiate institutes), 145; pupils enrolled, 31,912; average attendance, 19,862; teachers (Jan., 1909), 795; total expenditures, \$1,385,832. (b) Continuation schools, included in public and separate schools above, had 5317 pupils in attendance. 3. Pupils enrolled in elementary and secondary schools, 502,499 (an increase of 7156); average attendance, 298,280; grand total pupils and students in elementary, secondary, normal, and model schools, 504,573; school population between 5 and 21 years, 596,713; grand total paid for educational purposes in 1908, \$9,329,658.

**Prince Edward Island.** In 1908, there were 476 schools, with 580 teachers and 18,012 pupils. Expenditure, \$175,681.

**Quebec.** Statistics for the year 1908-9: 1. (a) Elementary schools: Number, 5648; pupils enrolled, 216,792; average attendance, 160,096 (73.85 per cent.); teachers, 6770 (men, 169). (b) Model schools: 660; pupils, 98,638; average attendance, 81,038 (82.16 per cent.); teachers, 2906 (men, 750). (c) Academies: 217; pupils, 51,582; average attendance, 44,595 (86.45 per cent.); teachers, 2395 (men, 686). (d) Normal schools: 10; students, 715; average attendance, 710; teachers, 59 (men, 58). (e) Schools annexed to normal schools: 9; pupils, 996; average attendance, 741; teachers, 38 (men, 7). (f) Roman Catholic classical colleges: 18; students, 6397 (males); average attendance, 5872; teachers, 609 (men). (g) Universities: 4; students, 2820 (females, 156); average attendance, 2816; teachers, 380 (men). (h) Schools for the deaf, dumb, and blind: 4; students, 558; average attendance, 556; teachers, 72 (men, 27). (i) Schools of art and design: 10; students, 2400 (males); average attendance, 1420; teachers, 54 (men). (j) Night schools: 71; pupils, 6495 (females, 853); average attendance, 3272; teachers, 158 (men, 140). (k) Total schools: 6651; pupils and students, 387,393 (196,906 male, 190,487 female); average attendance, 301,116 (77.85 per cent.); teachers, 13,586 (2880 men, 10,706 women). 2. Of the elementary schools, 4808, with 180,129 pupils, were Roman Catholic, and 845, with 31,814 pupils, Protestant. Most of the pupils in the model schools and academies are Roman Catholics. Aggregate contributions for education in 1907-8, \$5,148,887; in 1908-9, \$5,517,866 (from taxation, \$2,780,219; government grants, \$837,450).

**Saskatchewan.** In 1908 there were 1410 public elementary schools, with 47,086 pupils enrolled (37.622 in 1907) and an average attendance of 26,081 (55 per cent.). Of the total,

15,200 pupils were in the first grade. Expenditure in 1908, \$2,679,373 (teachers' salaries, \$831,842). There were eight high schools and a normal school.

**AGRICULTURE.** The year 1909 showed the highest development of agricultural interests in the history of the country. The area in crops (exclusive of British Columbia) was 30,065,556 acres, and the value of products computed at local market prices \$532,992,100, as compared with 27,505,663 acres and \$432,534,000 for 1908. The value of field crops by provinces was: Ontario, \$200,398,000; Saskatchewan, \$97,677,500; Quebec, \$90,071,000; Manitoba, \$74,420,500; Nova Scotia, \$22,319,000; Alberta, \$20,741,000; New Brunswick, \$18,150,000; Prince Edward Island, \$9,213,000. In the Northwest Provinces, wheat production increased from 23,457,000 bushels in 1900 to 147,482,000 bushels in 1909; oats from 16,653,681 to 185,439,000; barley from 3,141,121 to 31,358,000. In Ontario, the yield in 1900 and in 1909 was: Winter wheat, 21,879,000 bushels and 14,086,000 bushels respectively; spring wheat, 6,539,900 and 2,176,000; oats, 88,138,974 and 109,192,000; barley, 16,087,862 and 20,952,000. In Quebec, the principal crops were 1,968,203 bushels of wheat, 33,536,677 of oats, and 2,535,597 of barley in 1900, against 1,679,000 wheat, 42,501,000 oats, and 2,604,000 barley in 1909. In the three Maritime Provinces, the wheat yield in 1900 was 1,369,000 bushels, oats, 11,725,000, and barley, 385,760, against 1,321,000 wheat, 16,334,000 oats, and 484,000 barley in 1909. Hay (including clover and forage crops), in Ontario, amounted to 3,792,000 tons in 1900 and 7,068,000 tons in 1909; in Quebec, 2,182,650 and 4,879,000 respectively; in the Maritime Provinces, 1,356,300 and 2,395,000.

Final estimates of the areas planted to field crops in 1908 and 1909 and of the yield and value (in thousands of bushels and dollars respectively) are as follows:

Crops		Acres	1000 bu.	1000 dol.
Wheat,	1909..	7,750,400	166,744	141,320
	1908..	6,610,300	112,434	91,228
Oats,	1909..	9,302,600	353,466	122,390
	1908..	7,941,100	250,377	96,489
Barley,	1909..	1,864,900	55,398	25,434
	1908..	1,745,700	46,762	21,353
Rye,	1909..	91,300	1,715	1,254
	1908..	100,350	1,711	1,262
Peas,	1909..	393,300	8,145	7,222
	1908..	412,900	7,060	5,970
Buckwheat,	1909..	282,440	7,806	4,554
	1908..	291,300	7,153	4,215
Mixed grains,	1909..	582,100	19,391	10,916
	1908..	581,900	19,049	10,140
Flax,	1909..	108,471	2,213	2,761
	1908..	139,300	1,499	1,467
Beans,	1909..	55,970	1,325	1,881
	1908..	60,100	1,245	1,988
Corn for husking,	1909..	352,570	19,258	12,760
	1908..	366,200	22,872	11,837
Potatoes,	1909..	513,508	99,087	36,099
	1908..	503,600	73,790	34,819
Turnips, etc.,	1909..	248,047	107,725	18,198
	1908..	271,443	101,248	17,532
Hay,	1909..	8,210,300	11,877*	132,288
	1908..	8,210,900	11,450*	121,884
Fodder-corn,	1909..	269,650	2,780*	15,116
	1908..	259,770	2,928*	11,732
Sugar-beets,	1909..	10,000	86*	500
	1908..	10,800	109*	578

\* Thousands of tons.

The year 1910, for which final returns are not yet available, showed a decrease in agricultural production; the three most important cereals are estimated in thousands of bushels as follows:

Provinces	Wheat	Oats	Barley
Saskatchewan .....	66,425	55,617	2,818
Manitoba .....	27,001	24,137	7,687
Ontario .....	19,405	128,491	21,368
Alberta .....	6,464	18,210	4,218

Livestock estimates, June, 1908, and June, 1909: Horses on farms, 2,118,165 and 2,132,489 respectively; milch cows, 2,917,746 and 2,849,306; other horned cattle, 4,629,806 and 4,384,779; sheep, 2,801,404 and 2,705,390; swine, 3,369,858 and 2,922,509. The total value of farm animals is computed at \$531,000,000 for 1908 and \$558,789,000 for 1909.

The foregoing statistics of agriculture do not include figures for British Columbia. Some details not mentioned above, by provinces, are as follows:

**Alberta.** In 1909, the value of field crops was \$20,741,000, against \$14,000,000 in 1908. Total crop area, 1,242,644 acres, against 837,641 in 1908 and 298,433 in 1904; total yield in bushels (threshers' measure), 36,761,493, an increase of 46 per cent. over 1908. Principal yields in 1909: Spring wheat, 6,155,455 bushels; winter wheat, 2,313,344; oats, 24,819,661; barley, 3,310,332; flax, 131,531. In 1909, 9658 horses and 103,013 cattle were exported. The province continues its rapid development.

**British Columbia.** Figures for field crops are not available, but production is small. The annual value of fruit farm products is about \$8,500,000.

**Manitoba.** In 1909, the value of field crops was \$74,420,500, against \$66,000,000 in 1908. Crop area in 1909, 4,777,210 acres (2,642,111 under wheat); yield of grain, 113,504,484 bushels, of which 45,774,708 were wheat, 50,983,056 oats, and 16,416,034 barley; potatoes, 5,450,200 bushels, and other "roots," 2,659,928. Livestock: 189,132 horses, 372,520 cattle, 17,922 sheep, and 155,541 swine.

**New Brunswick.** Aggregate crop value in 1909, \$18,150,000. In 1907, 1,664,941 acres were under crop and 16,290 in orchard and garden.

**Nova Scotia.** Aggregate crop value in 1909, \$22,319,000, against \$22,000,000 in 1908. In 1908, 1,282,050 acres were under crop and 54,041 in orchard and garden. The most valuable crop is hay. The province produces large quantities of excellent apples.

**Ontario.** The value of field crops in 1909 was \$200,398,000, against about \$185,000,000 in 1908. Area under crop, 9,103,793 acres; pasture, 3,180,780; orchards and vineyards, 336,398. Livestock (July 1, 1910.): 724,384 horses, 1,052,796 milch cows, 1,514,332 other cattle, 1,065,101 sheep, and 1,561,042 swine—all these figures showing a slight decrease as compared with 1909.

**Prince Edward Island.** Field crop value in 1909, \$9,213,000, against \$9,408,000 in 1908. Area under crop in 1907, 9,621,683 acres.

**Quebec.** Value of field crops in 1909, \$90,071,000, against about \$80,000,000 in 1908. Area under crop in 1907, 5,250,405 acres; in orchard and garden, 77,416.

**Saskatchewan.** Value of field crops in 1909, \$97,677,500, against about \$37,000,000 in 1908.

This province, which is being rapidly opened up by railways, is experiencing an extraordinary rapid development.

**Homesteads.** Ordinary homestead entries numbered 38,559 in 1908 and 37,061 in 1909. In the two years respectively the entries made in Manitoba numbered 3557 and 2526; in Saskatchewan, 21,004, and 19,354; in Alberta, 13,558, and 14,907; in British Columbia, 440, and 274. The number of pre-emptions was 12,280, in 1908 and 14,613 in 1909; purchased homesteads, 681 and 997; entries for "South African Volunteer Homesteads," 79 and 2624. Homestead acquisition is principally in the Northwestern Provinces—Saskatchewan, Alberta, and Manitoba. See also article AGRICULTURE.

**MINING AND METALS.** A Canadian report, official, but preliminary and subject to slight revision, values the mineral products of the Dominion in 1909 at \$90,378,429, as compared with \$85,927,802, the finally revised total of 1908. Of the total production in 1909, \$45,151,053 is credited to the metals, and \$45,227,376 to non-metallic products. Of the total value in 1909 27 per cent. represented coal, 10,411,955 tons, valued at \$24,431,351 (\$25,194,573 in 1908; about one-half was produced in Nova Scotia). Silver had second place, with an output of 27,878,590 ounces, valued at \$14,358,310 (15.9 per cent.); of this amount 25,737,037 ounces, worth \$12,382,689, was produced at the Cobalt mines in Ontario. The silver output in 1908 was valued at \$11,686,239. The gold output (10.8 per cent.) amounted to \$9,790,000 (against \$9,842,105 in 1908); Yukon was credited with \$3,960,000. The values of other minerals produced in 1908 and 1909 are stated as follows: Nickel, \$3,231,538 and \$9,461,877; copper, \$8,413,876 and \$7,018,213; asbestos (from Quebec), \$2,555,361 and \$2,284,587; lead, \$1,814,221 and \$1,959,488. Petroleum production in 1908 and 1909, 26,081,139 and 17,379,871 gallons; Portland cement, 2,665,289 barrels (\$3,709,063) and 4,010,180 barrels (\$5,266,008). Pig iron produced in 1908, 686,780 tons (108,359 from Canadian and 578,421 from foreign ore); in 1909, 609,431 tons (97,826 Canadian and 511,605 foreign); by importation, the consumption of pig iron in the two years reached 925,441 and 683,212 tons. In 1908 and 1909, the output of steel was 661,940 and 570,588 tons; of steel manufactures, 57,856 and 55,515 tons. Ontario leads in furnace products, its pig iron output in 1909 amounting to 407,013 tons, valued at \$6,301,528. In 1909 gold was discovered near Porcupine Lake and in 1910 near Stewart.

**FISHERIES.** The annual catch has been valued as follows: 1904, \$23,516,439; 1905, \$29,479,562; 1906, \$26,279,485; 1907, \$25,499,349; 1908, \$25,451,094. In the latter two years, the value by provinces was: British Columbia, \$6,122,923 and \$6,465,038 respectively; Manitoba, Alberta, Saskatchewan, and Yukon, \$968,422 and \$861,392; New Brunswick, \$5,300,564 and \$4,754,295; Nova Scotia, \$7,632,330 and \$8,009,856; Ontario, \$1,935,025 and \$2,100,075; Prince Edward Island, \$1,492,695 and \$1,378,621; Quebec, \$2,047,390 and \$1,881,817. In 1908 the lobster catch of Prince Edward Island was valued at \$933,243; cod, \$115,820; all whale products, \$357,500, were credited to British Columbia. Other important details of the catch in 1908 are shown in the following table (values

in thousands of dollars except for total Canada):

	N. S.	N. B.	Que.	Canada

\* Northwest—Manitoba, Alberta, Saskatchewan, and Yukon.

**MANUFACTURES.** The latest census of manufactures, taken in 1906 for the calendar year 1905, showed 15,796 establishments, with a capital of \$846,585,023; wage earners, 356,034; wages for labor, \$134,375,925; and value of products, \$718,352,603. Of the last figure, Ontario was represented by \$367,850,002 and Quebec by \$219,861,648. By groups the value of products was as follows: Food, \$173,359,431; textiles, \$85,982,979; iron and steel, \$53,125,265; timber and lumber and their re-manufactures, \$112,494,072; leather and its finished products, \$42,132,007; paper and printing, \$33,738,772; liquors and beverages, \$14,394,319; chemicals and allied products, \$15,703,306; clay, glass, and stone products, \$13,986,000; metals and metal products other than steel, \$50,828,968; tobacco and its manufactures, \$15,274,923; vehicles for land transportation, \$37,396,302; vessels for water transportation, \$1,943,195; miscellaneous, \$66,294,869; products of hand trades, \$1,698,195.

**FOREIGN COMMERCE.** Imports of merchandise for home consumption, of total merchandise, of coin and bullion (in thousands of dollars), and total imports are shown in the following table (the first three years named ended June 30, and the last three March 31):

Yrs.	Mdse. Home Consump.	Total Mdse.	Coin and B.	Total Imports
1895 ..	\$100,675,891	\$106,205,062	4,577	\$110,781,682
1900 ..	172,506,878	181,325,075	8,297	189,622,513
1905 ..	251,617,119	256,525,982	10,308	266,834,417
1908 ..	351,879,955	364,237,864	6,549	370,786,525
1909 ..	288,217,515	299,768,166	9,988	309,756,608
1910 ..	369,815,427	385,835,103	6,018	391,852,692

For the same years, exports of domestic merchandise, of total merchandise, of coin and bullion (in thousands of dollars), and total exports were as follows:

Years.	Domest. Mdse.	Total Mdse.	Coin and B.	Total Exports
1895 ..	\$102,828,441	\$109,313,484	4,325	\$113,638,803
1900 ..	168,972,301	183,237,555	8,657	191,894,723
1905 ..	190,854,946	201,472,061	1,845	203,316,872
1908 ..	242,078,452	263,368,952	16,638	280,006,606
1909 ..	242,603,584	259,922,366	1,590	261,512,159
1910 ..	279,247,551	298,763,993	2,595	301,358,529

In the fiscal year 1909, dutiable imports amounted to \$175,014,160; free imports, \$113,203,355; and import duties, \$48,059,792; in 1910, \$227,264,346, \$142,551,081, and \$61,024,239 respectively.

The principal classifications of total imports show the following values for the years ended March 31, 1909, and 1910, respectively: Metals, minerals, and their manufactures, \$54,505,437 and \$78,683,141; coal, coke, etc., \$28,761,207 and \$30,673,331; cotton and its manufactures, \$18,609,542 and \$28,103,286; wool and its manufactures, \$17,195,096 and \$24,680,481; bread-stuffs, \$17,083,506 and \$19,908,765; sugar, molasses, etc., \$13,285,155 and \$14,850,944; wood and its manufactures, \$8,779,242 and \$13,468,713; settlers' effects, \$7,721,599 and \$10,273,428; drugs, chemicals, dyes, etc., \$9,135,222 and \$10,163,357; fruits, \$8,433,576 and \$9,426,811; hides, skins, pelts, \$5,218,108 and \$8,237,014; silk and its manufactures, \$4,630,056 and \$6,017,858; rubber, gutta percha, and their manufactures, \$3,387,941 and \$5,957,130; furs and their manufactures, \$3,670,919 and \$5,754,967; oils, \$4,777,361 and \$5,627,482; flax, hemp, jute, and their manufactures, \$4,004,753 and \$5,368,261; tea, \$5,081,306 and \$5,348,775; paper and its manufactures, \$3,656,279 and \$4,658,714; provisions, \$4,154,621 and \$4,406,363; tobacco and its manufactures, \$4,176,391 and \$4,257,776; leather and its manufactures, \$3,104,011 and \$4,239,156; books, etc., \$3,498,868 and \$4,051,410; spirits and wines, \$3,083,859 and \$4,014,748; carriages, carts, etc., \$2,051,799 and \$3,724,522; electrical apparatus, \$2,128,241 and \$3,690,966; hats, caps, etc., \$2,592,039 and \$3,417,781; glass and its manufactures, \$2,281,666 and \$2,918,129; cordage, twine, and their manufactures, \$1,722,738 and \$2,154,471; gloves, etc., \$1,336,293 and \$1,924,754; earthenware and china, \$1,726,946 and \$1,843,523.

The following table shows by great classes the values of Canadian produce exported and of total exports (that is, Canadian and foreign produce combined) in the years ended March 31, 1909, and 1910 (letters at the left are employed as follows: a, produce of mine; b, produce of fisheries; c, produce of forest; d, animals and their produce; e, agricultural produce; f, manufactures; g, miscellaneous articles; h, total; i, coin and bullion; j, grand total):

	1909		1910	
	Can. prod.	Total	Can. prod.	Total
a ..	\$37,257,699	\$37,563,868	\$40,087,017	\$40,530,843
b ..	13,319,664	13,347,978	15,668,162	15,760,391
c ..	39,667,387	39,893,350	47,517,033	47,688,256
d ..	51,349,646	52,026,710	52,926,515	54,696,630

i ..	2	1,589,793	.....	2,594,536
j ..	242,603,586	261,512,159	279,247,551	301,358,529

Grain is the leading export, details of which in thousands of bushels (b) and thousands of dollars (d) are shown in the following table, for years ended March 31:

Years	Wheat	Oats	Barley	All grain
1900—b	16,845	6,929	2,156	30,055
d	11,995	2,143	1,010	18,057
1905—b	14,700	2,367	1,041	19,748
d	12,387	862	515	15,125
1908—b	43,655	7,123	1,990	53,949
d	40,005	3,172	1,223	45,563
1909—b	49,137	5,256	2,959	59,205
d	48,148	2,176	1,745	53,783
1910—b	49,741	3,402	2,045	56,867
d	52,609	1,567	1,108	56,751

The foregoing figures are for domestic exports (that is, the products of Canada). In the fiscal year 1910, the total grain export was \$68,404,421 (Canadian, \$56,750,571), of which wheat was \$60,431,253 (Canadian, \$52,609,351); Canadian wheat flour, \$14,859,854 (\$7,991,413 in 1909). Other important domestic exports, in the fiscal years 1909 and 1910 respectively, were: Lumber, \$32,379,809 and \$38,490,476; cheese, \$20,384,666 and \$21,607,692; silver, \$13,284,084 and \$15,009,937; living animals, \$11,798,028 and \$12,107,971; meats, \$9,984,425 and \$8,013,680; gold-bearing quartz, dust, nuggets, etc., \$7,293,420 and \$6,016,126; copper, \$6,406,528 and \$6,023,925; wood manufactures, \$5,081,221 and \$6,094,844 (wood pulp, \$4,306,929 and \$5,204,579); wood for pulp, \$4,356,391 and \$6,076,628; hides and skins other than furs, \$4,029,676 and \$5,430,591; paper, \$3,469,713 and \$3,156,096; codfish, \$3,348,149 and \$3,619,853; lobsters, \$3,218,466 and \$3,149,497; salmon, \$3,002,311 and \$4,887,632; furs (including marine), \$2,617,716 and \$3,784,376; iron and steel and their manufactures, \$2,479,284 and \$2,475,982; leather and its manufactures, \$2,369,577 and \$1,379,581; alcoholic liquors, \$1,127,482 and \$1,168,952; flaxseed, \$855,908 and \$3,642,476.

In the fiscal years 1909 and 1910, the value of merchandise imported for home consumption and of domestic merchandise exported are shown by countries as follows, in thousands of dollars:

	Imports from		Exports to	
	1909	1910	1909	1910
United States.....	170,056	217,502	85,335	104,200

**SHIPPING.** In the fiscal year 1910, there entered 15,008 sea-going vessels, of 10,950,600 tons (15,140 of 10,264,187 tons in 1909) and cleared 14,776, of 9,853,713 tons. British and Canadian vessels entered, 8232, of 7,834,716 tons, and cleared, 8405, of 6,702,354 tons; United States entered, 5716, of 1,711,708 tons, and cleared, 5251, of 1,734,540 tons. Of the total entrances, 8209 vessels, of 9,944,430 tons, were steam, and 6799, of 1,006,170 tons sail; clearance, 7640, of 8,826,936 tons steam, and 7136, of 1,026,777 tons sail. Of the tonnage entered in the trade on rivers and lakes between Canada and the United States, 6,602,352 was Canadian, and 5,482,007 American—total 12,084,359; cleared, 5,579,821 Canadian, and 6,099,498 American—total, 11,679,319.

**COMMUNICATIONS.** Total single-track railway mileage in operation June 30, 1908, 22,966; June 30, 1909, 24,104. For the year ending on the latter date, gross earnings, \$145,056,336; working expenses, \$104,600,084; capital, \$1,308,481,416. Mileage in operation by provinces in 1908 and 1909 respectively: Alberta, 1323 and 1322; British Columbia, 1733 and 1796; Manitoba, 3111 and 3205; New

Brunswick, 1509 and 1547; Nova Scotia, 1344 and 1351; Ontario, 7932 and 8229; Prince Edward Island, 268 and 269; Quebec, 3574 and 3663; Saskatchewan, 856 and 1006; Yukon, 59 and 59. Electric railways, June 30, 1909, aggregated 989 miles, with \$91,604,989 capital, \$14,811,726 earnings, and \$3,885,235 working expenses. Canada has an extensive system of canal, river, and lake navigation. In 1908 there were 33,222 miles of telegraph line (7270 government), with 123,080 miles of wire and 2759 offices. Post-offices, March 31, 1909 and 1910, 11,823 and 12,479, respectively.

**FINANCE.** In the year ending March 31, 1909, the total revenue was \$85,549,580; total expenditure, \$133,441,524, including sinking-fund deposits of \$1,922,525; net excess of expenditure, \$45,969,419. Figures for the following fiscal year: Consolidated Fund receipts, \$101,503,711; other receipts, \$112,765; total receipts, \$101,616,476;—expenditure chargeable to Consolidated Fund, \$79,411,747; expenditure chargeable to "Capital," \$29,756,353; railway subsidies, \$2,048,097; other charges, \$4,179,576; total expenditure, \$115,395,774, including sinking-fund deposits of \$1,441,031; net excess of expenditure, \$12,338,267. Principal sources of Consolidated Fund receipts in the fiscal year 1910: Customs, \$60,156,134; excise, \$15,253,353; railways, \$9,647,551; post-offices, \$7,958,548; Dominion lands, \$2,886,000; interest on investments, \$2,867,465;—leading items of expenditure chargeable to Consolidated Fund: Interest on public debt, \$13,098,161; railways and canals, \$11,021,013; subsidies to provinces, \$9,361,388; public works, \$7,837,709; post-office, \$7,215,337; militia, \$4,679,956; civil government, \$4,268,390. Expenditure chargeable to Capital: Railways and canals, \$23,156,620; public works, \$4,514,606; militia, \$1,299,970; Dominion lands, \$785,158. Net public debt at end of fiscal years: 1908, \$277,960,860; 1909, \$323,930,279; 1910, \$336,268,546. Sinking fund on last two dates, \$38,515,547 and \$14,782,613.

**BANKS.** On June 30, 1910, the Canadian chartered banks had total assets \$1,230,525,305, including: Specie, \$27,586,533; Dominion notes, \$74,349,645; loans in Canada, \$710,744,878; other, \$417,844,249;—total liabilities, \$1,040,324,464, including paid up capital, \$98,728,342; reserve fund \$79,370,321; notes in circulation, \$79,781,631; deposits, \$797,849,593; other, \$162,693,240. On the same date the 1133 post-office savings banks had 148,893 open accounts, with deposits and interest \$43,586,357 (average account, \$292.73); the 18 government savings banks had deposits and interest \$14,677,872; total, \$58,264,230. Circulation of Dominion notes, March 31, 1910, \$87,134,069.

**ARMY.** By the Militia Act of 1904 every Canadian between the ages of 18 and 60 is liable to military service. The enthusiasm so markedly manifested in 1909 resulted in forming new volunteer organizations. These consist of a permanent force which averages very close to the regular army and consists of 5000 men. This was to be employed as a means of instruction for the various volunteer and militia organizations. The active militia in addition consisted of mounted troops on a peace basis aggregating 3100 of all ranks, which in time of war would be increased to 8000. The field artillery as organized were about 2000 on a peace basis and would be increased

to 3470 for war service. The total strength of the active militia on a peace basis was estimated at about 3000 officers and 41,000 men, rank and file and 7600 horses; on a war basis this force would amount to 5000 officers, 100,000 rank and file and 17,500 horses. The Dominion included many rifle clubs, which have some 14,000 active members. An efficient Military College at Kingston is also maintained. During the year the question of developing this institution into a staff college and associating with it colleges in other parts of the Dominion was being considered. Inspection of the military conditions of the Dominion was made by Sir John French after a visit to the various fortifications, camps, and military scenes, and he reported that in many respects military establishments fell short of the requirements. The plans adopted were not believed to facilitate a rapid mobilization of forces and the coöperation of the various arms of the service. The cadet army and militia, however, contained soldiers of a high grade of intelligence and individual strength, and much military enthusiasm was being manifested.

**NAVY.** The naval defense of Canada has been assumed by the Imperial Government, but the passage of the Naval Service Act (1 George V., c 43) on Apr. 20, 1910, marked the introduction of a new policy by creating a new branch of the Department of Marine and Fisheries, having charge of the Naval Service. (See below, paragraphs on *History*.) On April 30, the Canadian Parliament voted \$3,000,000 for the construction and support of the new navy, the maintenance of dockyards at Esquimaux and Halifax, and the establishment and maintenance of training schools. Later in the year Canada bought and received two British protected cruisers, the *Rainbow* and *Niobe*, of 3600 and 11,000 tons each, which are to be used as training ships.

**GOVERNMENT.** The executive authority is vested in the British sovereign acting through a governor-general, who is assisted by a cabinet of 14 members. The legislative power devolves upon a parliament of two houses, the Senate (87 members, nominated for life by the Governor-General) and the House of Commons (214 members, elected by popular vote). The Governor-General in 1910 was Sir Albert Henry George, Earl Grey (appointed Sept. 26, 1904). Cabinet ministers in 1910, with date of appointment: Prime Minister, Sir Wilfrid Laurier (1896); Secretary of State, Charles Murphy (1908); Postmaster-General, Rodolphe Lemieux (1906); Minister of Trade and Commerce, Sir Richard J. Cartwright (1896); Minister of Justice, Allen B. Aylesworth (1906); Minister of Marine and Fisheries, and of the Naval Service, Louis P. Brodeur (1906); Militia and Defence, Sir Frederick W. Borden (1896); Agriculture, Sydney Arthur Fisher (1896); Public Works, William Pugsley (1907); Finance, William S. Fielding (1896); Railways and Canals, George P. Graham (1907); Interior, Frank Oliver (1905); Customs, William Paterson (1897); Inland Revenue, William Templeman (1906); Labor, William Lyon Mackenzie King (1909).

Each province has an elected legislature and an executive (lieutenant-governor) appointed by the Governor-General and assisted by a responsible ministry. See articles on the several provinces.

For information concerning Charities, see **CHARITY**.

#### HISTORY

**NAVAL DEFENSE.** On January 12 the government introduced the Naval Service bill which provided for a permanent naval force with reserves and with volunteers, to be under the control of the Department of Marine and Fisheries, but constituting a separate branch of that department under a Director of the Naval Service and a Naval Board. If the necessity arose, the Government in Council might place the Canadian naval service, or any part thereof, at the disposal of the Imperial Government for general service in the Royal Navy. The bill contemplated a naval college corresponding to the military college at Kingston. The building programme included the construction of four vessels of the *Bristol* type, one of the *Boadicea* type and six destroyers, at an estimated cost of £2,338,000, an increase of 22 per cent. on account of the provision that the ships should be built in Canada. The construction was to be begun as soon as possible. The vessels were to be distributed between the Atlantic and Pacific coasts. The leading argument against the bill was that it tended to foster a spirit of independence that would lead finally to separation from Great Britain. Mr. Borden, the Opposition leader, speaking on the measure in January, declared its provisions utterly inadequate, saying that although a crisis might occur within five years, and very probably within three, the navy would not be effective in less than 15 or 20 years. He referred to the alarm in Great Britain over the German peril in 1909 and to the threatening statement in the German Navy bill of 1900 to the effect that Germany's battle fleet must be so strong that even the strongest naval power would find its position doubtful if it ever undertook a war with her. The Liberals supported the measure, but the Conservatives were divided on the question, some being averse to any action at all, and others favoring direct contribution to the British Navy. Early in February, on the occasion of the second reading of the bill, Sir Wilfrid Laurier declared that the Government would insist on it. He said the eleven vessels would be built in Canada and that the Government would ask for tenders for the shipbuilding plant. One year would be required for these preliminaries and the building of the vessels would take four years. Mr. Borden condemned the bill as a departure from the plans of the admiralty and as a dangerous measure, in that it allowed the Government to withhold ships from the empire in case of war. It contained no assurance that the new navy would be of any use either to the empire or to Canada, and in place of it he urged a free contribution from the Canadian people of an amount sufficient for the construction of two *Dreadnoughts*, to be expended at the discretion of the admiralty. In the course of the debate the Government condemned the direct contribution as an offer of tribute, and argued for strict autonomy. Early in March, Mr. Borden's amendment, providing for direct free contributions, was defeated by a vote of 129 to 74. The Conservative motion for a plebiscite on the question and the final motion to kill the bill altogether were also lost. The bill passed the House on March 10 by a party majority of 41.

**LEGISLATION.** The chief work of Parliament,

which was prorogued on May 4, was the passage of the Naval Defense bill as outlined above and of an anti-trust measure, known as the Combines Investigation Act. The latter was a radical measure brought in by the Minister of Labor, Mr. Mackenzie King, which provided for the appointment of a board of three members, one to be chosen by the plaintiff, one by the defendant, and the third, either by joint agreement or by a judge. Its purpose was to investigate the charges of monopoly and it had complete judicial powers. If the board found that a monopoly existed, two remedies might be applied, namely, withdrawal of tariff protection from the products of the monopoly or the imposition of a fine of \$1000 a day so long as the abuse continued. The Government might revoke any patent that was employed in restraint of trade or for the raising of prices. Among other acts of general public scope may be mentioned an immigration measure repealing previous laws, introducing stringent provisions for the exclusion of undesirable aliens and making other important changes in the legislation which it superseded; a law making the drivers of motor vehicles liable to criminal suits for reckless driving, etc.; the reduction of the import duties on 13 classes of commodities in accordance with the understanding with the United States Government (see below paragraph on *Tariff Affairs*); an important insurance act repealing previous insurance laws and prescribing the status of insurance companies in Canada; railway legislation granting certain subsidies in aid of railway building, incorporating the Canadian Northern Alberta Railway Company and providing for its construction under government guaranties, and providing for the leasing of roads connected with the government Intercolonial lines.

**TARIFF AFFAIRS.** An agreement with Germany respecting the tariff was regarded as an important step in bringing to an end the commercial war between these two countries, which had been going on since 1903. By this agreement Canada suspended the surtax on German imports and Germany applied her conventional tariff to many classes of Canadian imports. The new provision of the amendment was to go into effect on March 1. The Canadian surtax hereby repealed amounted to 33½ per cent. and had been imposed since 1903. Many Canadian writers expressed approval of the arrangements so far as Canada was concerned, inasmuch as the list of Canadian imports admitted under the new agreement comprised practically all for which Canada could expect to find a German market. For a discussion of the question of applying the maximum provision of the Payne tariff to Canada, see the article **TARIFF**.

In the spring the tariff situation as regards the United States became so acute as to cause a fear of a tariff war between the two governments. Canada refused concessions and was unwilling to admit that her tariff discriminated unduly against the United States, pointing out that while the average United States duty on Canadian imports was 42 per cent., the Canadian duty on United States imports was but 23 per cent., and declaring that the restrictions on the exports of pulp wood from the Provinces was outside of the jurisdiction of the Dominion Government. The tariff situation in Canada was used in Great Britain to enforce the arguments for tariff reform. By the commercial treaty

with France, whose ratifications were exchanged in February, many classes of French exports received the benefit of the Canadian intermediate tariff and some of them were admitted under lower duties even than the preferential duties accorded to British goods under the preference measure passed by the first Laurier Ministry. The removal of the Canadian surtax on German imports paved the way for a commercial treaty with that country similar to the treaty with France. Canada had imposed that surtax as a retaliation for a like step on the part of Germany, which tried to punish Canada for British preference. The provision of the American Payne tariff was aimed at those countries which seemed to discriminate against the United States, and it levied a penal tariff of 25 per cent. above the normal rate on such countries. For some time it seemed to be a question whether the United States Government would take the same view of British preference as the German Government had done, but the United States was not disposed to regard British preference as discrimination against her, viewing the Empire as a unit. The treaty with France, however, was viewed by the United States as perhaps involving that point. Trade with the United States was very important. Canada bought from that country twice as much as the United States from her, and controlled the raw material of important American industries. In the West Indies the Canadian preference for British grown sugar had revived the flagging sugar industry. In March a conference was held between Mr. Fielding, the Canadian Minister of Finance, and President Taft, at Albany. Finally a tariff agreement with the United States was reached by which the minimum tariff under the Payne Act was conceded to Canada, and Canada on her part reduced the duties on thirteen classes of goods. It was adopted by the House on May 4.

The tariff discussion was active throughout the year. In a speech delivered in July Sir Wilfrid Laurier declared in favor of a gradual tariff reduction, which should be preceded by a tariff commission like that of 1907. The trade policy of England, was, he thought, the ideal at which all countries should aim, but in the case of Canada he believed it would not be attained for two generations. In a speech at Nelson he declared the Government's position in the following words: "We are asked on every hand by different interests for free trade and protection. It will be our aim to evolve a tariff calculated to benefit the whole country. The cardinal feature and outstanding principle of the tariff is the British preference, and so long as we stay in office it will remain. It is not the policy of the Canadian Government to ask Great Britain to change her fiscal policy by an iota. We make our own interests, so with Great Britain. The loyalty of Canada to the British Empire is not dependent on any tariff relations."

Plans were made in October for the organization of a delegation of Western farmers with whom were to be united the farmers of the organization in the Eastern Provinces to petition the Government that farm implements be placed on the free list and also that natural products be made the subject of reciprocity with the United States. Further demands were, the increase of British preference to 50 per cent., a general reduction of the tariff, the immediate

construction of the Hudson Bay railway, and Government ownership of terminal elevators. See AGRICULTURE.

**RECIPROCITY.** At the end of March, Sir Wilfrid Laurier announced the Government's intention to discuss reciprocity with the United States and later the Government accepted President Taft's invitation to a reciprocity treaty conference. An official trade conference on the subject was opened between representatives of the United States and the Canadian Government early in November and its sessions were held secretly. Meanwhile, in certain quarters it was argued that Canadian tariff was not responsible for the unsatisfactory trade relations with the United States, that there was no possibility of reciprocity except in coal and that even that was doubtful and that, moreover, reciprocity would impair the chances of British preference and lose Canadians their advantage in the British market. It was feared that Canadian and British capital invested in railways and ocean steamships might be endangered by the diversion of the cattle and grain traffic to American transportation companies. Sir Wilfrid Laurier, however, in a speech at Montreal in October defending the Government's course in entering into reciprocity negotiations with the United States, said that it was the first duty of the Government to work for the prosperity of the people and that it was possible to make a treaty with the United States which should confer equal benefits upon both countries. The negotiations with the United States were pending at the close of the year. See **TARIFF**.

**PREFERENCE.** The Royal Commission on the trade relations between Canada and the West Indies, which had carried on its investigations in 1909, published its report on September 26. It offered recommendations on the subject of Canadian preference on sugar, policy of reciprocity, steamship communications, telegraphs, and the work of the Department of Agriculture in the West Indies. As to the preference on sugar, the Commission believed that the policy of the Canadian Government had helped to avert the abandonment of sugar cultivation and it declared that the preferential policy was of great benefit to the West Indian producers and absolutely essential to the sugar industry in many of the islands. To maintain Canadian preference, however, it would be necessary to make reciprocal concessions. As to Jamaica, the inhabitants felt that they formed a separate unit in the empire and besides had comparatively slight interest in preference owing to the relative decline in sugar production during the last fifteen years and the predominance of the fruit growing industry. The Commission therefore held that Jamaica should be excepted from the general policy toward the West Indian colonies, although the way should be left open to her adherence if she so desired. The Commission reported that closer relations with Canada were generally desired throughout the West Indies, but that this was tempered in some of the islands by the fear that the United States might regard any preference for Canada as undue discrimination. The Commission, however, argued that since the United States did not treat Canadian preferential tariff as an undue discrimination it would not be likely to regard the granting of preference by the West Indies to any other part of the British dominions as having that character.

**INDUSTRIAL AFFAIRS.** In June the Conciliation Board investigated the questions which had arisen between the Canadian Pacific and Grand Trunk railways and their employees, and handed down a rule which generally favored the railroads. The Canadian Pacific, in order to avoid a strike, granted the men somewhat more favorable terms than those accorded by the award. On the Grand Trunk Railway, however, the strike which had been long threatened, broke out on July 18 when 3850 men left work on account of the refusal of their demands that their wages be standardized and freight rates be made the same as those on the eastern railroads. Immediately on the declaration of the strike, the company closed its shops. It was estimated that over 5000 men were thrown out of work. Freight traffic came to a standstill but the passenger service was continued. The strike ended on August 2, with a compromise, proposed by Mr. Mackenzie King, Minister of Labor, as mediator, by which the company accepted the decision of the Conciliation Board and thus granted an immediate increase in wages. (See **STRIKES AND LOCKOUTS, Canada**.) Many of the men were not taken back by the company, those who had taken their places being retained, and it was estimated that 1000 of the old employees were still out.

At the annual meeting of the Trades and Labor Congress at Fort William, action was taken toward the establishment of a Labor party, which should be able to take a vigorous part in the next general election. Sweeping reductions were ordered by the Dominion Railway Commissioners in September in the freight rates in the Yukon and White Pass Railway. Direct connection was arranged in June by the Grand Trunk Railway system with the Great Lakes and Halifax and St. John, thus giving a third route to the Atlantic seaboard for wheat and other exports. The Georgian Bay canal project was known to be given up for the present at the beginning of the year, but in March Sir Wilfrid Laurier spoke strongly for it and expressed his hope that work on it might soon be begun.

The proposal for an "All Red Route," made by Sir Wilfrid Laurier at the Imperial Conference in 1907, was still under consideration. It aimed at an improved through fast railway and steamship service between Great Britain and Australia and New Zealand via Canada. A committee appointed by the Imperial Government took the testimony of experts on the subject, but down to the close of 1910 no satisfactory plan had been devised.

**IMPERIAL CABLE.** The Pacific Cable Board on July 1 secured from the Canadian Pacific Railway Company the lease of a wire from the British Columbia terminus to Montreal, thus opening communication between Montreal, New South Wales and New Zealand. This reduced the distance to Great Britain of the cable controlled by the Board by 3000 miles. The management of the telegraphic communication between Canada and Montreal was thenceforth under the complete control of the British, Canadian, Australian and New Zealand Governments with power to fix charges in such a way as to promote trade between the dominions.

**IMMIGRATION.** A new regulation was issued by the Canadian Immigration Office on April 20 amending the rules forbidding the immigration into Canada of persons financially aided

by immigration societies, charity organizations or public funds, without the consent of the Immigration Office. Thenceforth such consent would be given only to persons suited for and willing and able to obtain farm work in Canada. Thus it closed the door against the skilled workman if he had accepted any financial assistance of the sort indicated. During the fiscal year 1909-10 the influx of immigrants into the Canadian West was remarkably large, 103,000 having come from the United States alone. It was expected that the number would reach 125,000 during the year 1910. According to the United States Bureau of Immigration, from March 31, 1909 to March 1, 1910, no less than \$95,371,000 was taken by Americans into Canada.

**OTHER EVENTS.** One of the worst accidents in Canadian railway history occurred on January 21, at Spanish River, 48 miles west of Sudbury, where the dining car of the "Soo Express" from Minneapolis fell into the stream and the second class car struck the stone abutment of the bridge. Thirty-seven bodies had been found by January 25th. A disastrous snowslide in Rogers Pass, Rocky Mountains, occurred early in March and the deaths were estimated at 62, of whom 37 were Japanese. Sir Wilfrid Laurier spent the months of July and August travelling throughout the country and making speeches on the public questions of the day. He returned from his western trip on September 7, having covered a distance of 9500 miles. The accounts for the fiscal year ending March 31, 1910, were made up early in June. They showed a great increase in the revenue, which came to about \$101,000,000. (See paragraph FINANCE above.) In September the Premiers of the Maritime Provinces, Nova Scotia, New Brunswick and Prince Edward Island, decided to petition Parliament for an amendment to the British North America Act, designed to prevent the relative decrease in the representation of these provinces, resulting from the increase of the western population, owing to the westward movement of Canadians and to immigration. In October the Conservation Congress met at Ottawa. An investigation was made in June into the condition of the Government Printing Bureau, with the result that four employees and one higher official were dismissed. Another afterwards was suspended and still another committed suicide. The Eucharistic Congress of the Catholic Church was held in September. See ROMAN CATHOLIC CHURCH.

**CANALS.** In comparison with the great Panama Canal (q. v.) all other work of this kind sinks into insignificance. Furthermore in 1910 there were very few important artificial

waterways under construction. Progress was being made on the New York State Barge Canal and a substantial beginning with the excavation for the Cape Cod Canal was accomplished, while the widening of the Kiel Canal in Germany was the most important European work. These are described below.

**PROPOSED INLAND WATERWAY.** The United States War Department through its corps of engineers was engaged during the year upon the preparation of plans and estimates for that section of the proposed internal waterway that will reach from New York to Philadelphia and be a part of the Atlantic coast canal. Eventually this will extend from Boston to Key West and thence to New Orleans by the Gulf of Mexico. On its engineering side such a canal presents few if any difficulties, and the question at issue was largely whether commercial and other interests would be proportionately benefited by its construction. Colonel Black, U. S. A., in charge of the preliminary plans believed that such a canal would develop the pottery, glass, brick and other industries in New Jersey and would tend to lower rates between manufacturing centres, along the Delaware River and in the vicinity of New York. The total estimate for the cost of the canal was \$38,725,000. It would require but 30 miles of excavation across the State of New Jersey and a dredging of the channel for 25 miles in the Delaware River. The question was one largely of policy in connection with some consistent plan for the construction and improvement of inland waterways throughout the United States. Such waterways in Europe have been particularly successful but it is problematic whether conditions are such in the United States as to warrant their construction.

**NEW YORK BARGE CANAL.** State Engineer and Surveyor Frank M. Williams at the end of the year 1910 reported in reference to the work on the New York Barge Canal that, taking into account the contracts awarded December 20 and 21, the work of providing a channel 12 feet in depth, with locks, dams and other structures necessary to provide for navigation, had been placed under contract for the entire Champlain and Oswego canals and the entire Erie Canal, excepting the two-mile section at Medina and a few hundred feet of excavation on the Troy and Tonawanda ends of the canal to connect with Government waters. There remained to be placed under contract the work of building incidental structures like bridges, guard-gates, electrical appliances, etc.

The entire work thus contracted for, amounting to \$73,036,000, was estimated in 1903, when the \$101,000,000 appropriation was passed, to cost \$75,906,000, showing a saving under the 1903 estimate of \$2,870,000. This fact it was believed went far toward verifying the opinion that the entire canal could be completed within the original estimate of \$101,000,000.

During the two years 1909 and 1910 work was placed under contract to the amount of \$37,296,000, covering 210 miles of canal, as against work amounting to \$25,740,000, covering 194 miles of canal, placed under contract by preceding administrations. During the same period construction work has been completed to the amount of \$17,300,000, as against work amounting to \$8,700,000 completed under preceding administrations.

In addition to the work done under the

\$101,000,000 estimate the State Engineer's department during the two years made a preliminary estimate of cost for the building of the Cayuga and Seneca Canal, and prepared plans for two contracts covering a large portion of this work. Those contracts were let towards the close of the year for \$1,306,177.

**SIPHON SPILLWAY, NEW YORK BARGE CANAL.** At certain places on the New York State Barge Canal, spillways are provided to allow excess water to run off in times of freshet or after heavy rains, and especially in locks where a constant water level is of importance. On the Champlain Division of this canal, siphon spillways are now being built, one at Whitehall, one at Lock No. 9, and one at Fort Edward. The siphon arrangement discharges the excess water more rapidly than a spillway, unless the latter be made of great length; and in the three localities above cited, long spillways were to be avoided. The concrete wall or abutment of the canal has an opening below the low water line from which a channel or conduit leads up into the wall to a point near the top, then turns down and terminates in an aperture in the outer wall face at a lower level than that on the inner face. When water rises in the canal to the level of the top of the siphon in the interior of the wall, water flows through the siphon and escapes to the overflow or drainage ditch, and will continue to flow until air is admitted to the top of the siphon, which is accomplished by having a small hole in the inner face of the wall that will admit air and "break" the siphon as soon as the water is drawn down far enough to uncover it. In building the wall, the air hole can be located so as to run off any desired depth of water and keep the level in that part of the canal constant. In the three siphons referred to, there are in each case four siphon pipes, each having a cross sectional area of  $7\frac{3}{4}$  sq. ft., and each will discharge 180 cu. ft. of water per second under a 10 ft. 6 in. head. Three air vents 6 in. x 12 in. are used as described. See also CONCRETE.

**CAPE COD CANAL.** The year 1910 witnessed work begun in earnest on a project that had been attempted, financially, many years ago, and the need for which had thrust itself upon the people of the Colonies of New York and Massachusetts even in the seventeenth century. This was the Cape Cod Canal, to be excavated through the isthmus that separates Buzzards Bay from Barnstable Bay on the Atlantic side of the southeastern extremity of Massachusetts. There has been for many years a large traffic that must pass through Vineyard Haven Sound and thence around Cape Cod or vice versa, often encountering bad weather and severe storms. This traffic amounts to 25,000,000 tons a year, of which 9,000,000 tons are made up of one commodity, coal, destined to New England ports. To avoid this, a canal was being cut for an actual distance of 8 miles, but dredging must be carried out a total of 13 miles, mostly in Monument River, to secure a depth of 30 feet of water for the whole distance between the bays. The canal will be 100 ft. wide on bottom and 250 ft. on the surface at the narrowest point. It involves the excavation of 17,000,000 cubic yards of sand, but otherwise presents no especial difficulty, as no locks are required. In order to protect the north side of the channel entrance at the east or ocean end, a breakwater, 3000 ft. long, was in course of construc-

tion. An interesting fact in connection with the project is that on the east end, in Barnstable Bay, the tide rises 9 ft., while at the Buzzards Bay end, the rise is only  $4\frac{1}{2}$  ft. the tidal periods being 3 hours apart. In addition to the greater safety to vessels afforded by this canal, it will shorten the distance 66 miles as compared with the around-the-cape route.

**KIEL CANAL.** Among the notable canals in use, in 1910, was the Kiel Canal between the Baltic and North Seas and an enlargement of this was undertaken, and was still in progress at the close of the year, about 4000 men being employed on the work. It was to be made double its original width, and deepened to allow the largest warships to pass through. The locks were to be enlarged and increased in length to 1090 ft. The cost of the improvement was estimated at \$55,000,000.

**CHICAGO DRAINAGE CANAL.** A notable piece of work in the Chicago Sanitary District has been put into use recently. This is called the North Shore Drainage Channel, and is a canal excavated for the purpose of conveying the sewage from Evanston and other near-by residence localities into the Chicago River and thence to the Drainage Canal. Beginning at Wilamette, Ill., the channel is cut  $8\frac{1}{4}$  miles in a west and southwestern direction until it meets the north branch of the Chicago River at Lawrence Avenue. It is from 26 ft. to 30 ft. wide on bottom and from 75 ft. to 100 ft. wide at the water line; the banks for most of its length being cut back on a slope such as will make them about 140 ft. apart at the top. In order to insure a flow through the channel of 1000 cu. ft. of water a second, there is a pumping plant located at the Lake Michigan end, provided with electric motors driving horizontal shaft screw pumps. The total cost of the work was \$2,770,000.

**CANALEJAS, Señor.** See SPAIN.

**CANARY ISLANDS.** A group of islands off the northwestern coast of Africa, which form a Spanish province. Area, 2808 sq. miles; population (1900), 358,564; estimated (1908), 403,908. The seat of government is Santa Cruz (Teneriffe); leading town, Las Palmas. The products and exports include potatoes, onions, tomatoes, and nuts. The new cable (projected to Pernambuco, Brazil) is open from Teneriffe to Monrovia (Liberia). Governor (1910), A. Eulate.

**CANCER.** An analysis of vital statistics showed a general increase in deaths from cancer throughout the civilized world in 1910. Cancer now causes more deaths among women than tuberculosis, and, taking both sexes together and all ages, the death rate for cancer nearly equals that of tuberculosis. At the same time, laboratories for studying the disease were multiplying and vast sums of money were expended in the search for the cause and cure of this disease. In the United States, one person alone (the late Mr. George Crocker, who, with his wife, died from cancer) willed \$1,500,000 to Columbia University, to be used for biological laboratory research. Probably the most important original laboratory work done during the year was that of Carrel and Burrows at the Rockefeller Institute. These investigators succeeded in cultivating, for the first time, human sarcoma outside of the body. Previous to this, they had propagated a very malignant fowl sarcoma in the blood plasma derived from the fowl from

which the original tumor had been taken, and were able to study the development of new sarcoma cells from hour to hour. In October, 1910, fragments of a human sarcoma, just removed from a patient, were inoculated into blood plasma. In this transparent medium, the growth could be watched, and individual cancer cells could be observed to migrate into the surrounding medium and undergo a process of multiplication. These observations were looked upon as constituting a long step forward in the investigation of malignant tumors. Cancer of the stomach at the present time is looked upon as a hopeless malady, because of the difficulty of diagnosing it in time for effective surgical removal. The early recognition of its presence is therefore of vital importance. Neubauer and Fischer attempted to supply a test, by which it would be possible to detect its presence, in cases of suspected cancer of the stomach, by an examination of the gastric juice. For their experiments, these observers prepared a polypeptid, called glycytryptophan, which yields tryptophan on hydrolysis. It was found that normal gastric juice did not hydrolyze glycytryptophan, while that of individuals suffering from cancer apparently contained a ferment which split up the test substance. They believe that the test will prove of value in determining the presence of cancer in the very earliest stages. See also **PHOTOTHERAPY**.

Several investigators attempted to cure cancer by the injection of various organic substances designed to raise the natural resistance of the individual. Fickera of the Surgical Institute at Rome, taking for his premise the fact that age is such an important factor in the development of cancer, injected autolysates of fetal and embryonal tissues into 36 cases of inoperable carcinoma, with encouraging results. In five cases, the tumors retrogressed or were transformed into ordinary connective tissue. Five other cases were benefited, and eight not influenced at all. The injection material was prepared by mixing one part of human fetal tissue in about twenty parts of physiological salt solution, to which was added a small amount of thymol of phenol as a preservative, with a layer of oil or toluol on top. This mixture was kept at a constant temperature of 99° Fahrenheit for two months, when it formed a homogeneous fluid and was ready for use. Levin used the autolyzed liver tissue of "nullers," which are rats naturally resistant to tumor implantation, and succeeded in producing a high degree of immunity in rats, not only before inoculation with tumors, but afterwards as well. Dr. Gaylord, in the latest report of the cancer laboratories of the New York State Department of Health at Buffalo, held out a hope of greatly relieving, and perhaps curing, many cancer patients, by means of the cancer virus prepared at this laboratory. This hope was based on inoculation experiments with the virus on rats. The theory is that where the animal's resistance is not sufficiently weakened by one inoculation of the tumor, this resistance can be increased by repeated doses, and in many cases immunity raised to a point that will bring about a cure. Other investigations were conducted by the laboratory in regard to the prevalence of so-called "fish cancer," which is deemed a goitre and not a cancer, by many. It was pointed out as a remarkable coincidence that the area of the United States, which includes the greatest

concentration of human cancer cases, is almost identical with the territory in which various members of the trout family are affected by this tumor of the thyroid. The possibility that cancer may be distributed through water is therefore suggested. The report states that the increase of cancer in the United States has been from 9 per 100,000 population in 1850, to 43 per 100,000 in 1900, an average of 65 in 1901, and of 70 in 1906. In the year 1909 there were 7034 cases of cancer reported in New York State.

In New York City, the ascitic fluid from a recovered case of cancer which had attacked breast, chest wall, and liver, was used successfully with several patients as an injection, and suggested a possible field for new experiment. It is felt that research among animal malignant tumors has been but slightly helpful toward solving the problem, and that human beings suffering from cancer, who gladly offer themselves for any study, should be utilized to the abandonment of rats and fish.

**CANDIDUS, WILLIAM.** An American singer, died in April, 1910. He was born in Philadelphia in 1840. He served in the Civil War, attaining the rank of major of artillery in the Federal Army. After the war he studied for opera in Berlin and Milan and became in 1880 a member of the Opera Company of Frankfort-on-the-Main. He was also at one time connected with the American Opera Company.

**CANDLER, ALLEN DANIEL.** An American public official, died October 26, 1910. He was born in Lumpkin county, Ga., in 1834 and graduated from Mercer University in 1859. He served throughout the Civil War in the Confederate Army, rising to the rank of colonel. He was principal of several educational institutions from the close of the war to 1871, when he was elected to the State House of Representatives. From 1879 to 1880 he served in the State Senate and from 1883 to 1891 was a member of Congress. He was Secretary of State of Georgia from 1894 to 1898 and was elected governor in 1898, serving until 1902. From 1903 to the time of his death he served as State historian.

**CAPE COD CANAL.** See **CANALS**.

**CAPE OF GOOD HOPE, THE.** A province (since May 31, 1910), of the Union of South Africa (q. v.); formerly the Cape of Good Hope Colony. Provincial capital, Cape Town.

**AREA, POPULATION, ETC.** Total area, estimated at 276,995 sq. miles; total population (1904), 2,409,804 (white, 579,747). The Dutch preponderate in the western districts; the English in the eastern. Area of the province proper, 206,860 sq. miles; population, 553,452 whites, 936,239 colored. The native territories are East Griqualand (7594 sq. miles, 222,685 inhabitants); Tembuland (4117 and 231,472), Transkei (2552 and 177,730), Walfish Bay (430 and 997), Pondoland (3918 and 202,757), and Bechuanaland (51,524 and 84,472). Number of marriages in 1908, 9446; births, 60,524; deaths, 33,967. Cape Town had (1904) 77,668 inhabitants (with suburbs, 169,641); Kimberley, 34,331; Port Elizabeth, 32,959; East London, 25,220. Immigration (1908), 23,511 adults and 3987 children; emigration, 27,479 adults and 5450 children. Education is free, but not com-

pulsory. Aided schools, June 30, 1908, 3726; pupils, 174,709. Students in colleges, 809. There is a university.

**INDUSTRIES.** Agriculture and stock-raising are important industries. In 1909 the wheat harvest was reported at 2,257,000 bushels, against 1,916,000 in 1908; corn in 1908, 1,758,000 bushels, against 3,550,000 in 1907. The Cape Province is the leading ostrich-breeding country; 500,000 tame birds are owned there, against 30,000 in all other countries (June 10, 1910). No statistics for cattle (1,954,390) and horses and mules (419,963) are given later than 1904. The number of sheep was reported, June 30, 1909, at 16,323,987, against 11,818,829 in 1904; goats, 7,376,346, against 7,162,463. Rigid regulations are being enforced to prevent an invasion of the fatal African coast fever, which has proved so disastrous to cattle in Natal and Transvaal. The vintage returns for 1909 are given at 3,445,200 gallons, against 4,950,000 in 1908. There are rich copper mines; gold and manganese are found; output of coal in 1908, 122,865 tons; value of diamonds found at Kimberley (1908), £2,685,150.

**COMMERCE, FINANCE, ETC.** The trade statistics given below are for calendar years and exclusive of specie; the financial, for fiscal years ending June 30:

	1906	1907	1908
Imports .....	£18,102,872	£15,586,792	£13,739,878
Exports .....	40,048,693	44,405,450	42,011,582
Revenue .....	8,236,880	7,701,192	6,981,873
Expenditure ..	8,231,719	8,349,316	7,973,727
Debt .....	49,199,918	51,235,343	53,145,880

British Board of Trade returns for 1909 give imports from Great Britain at £6,188,013; exports thereto, £7,693,042. Hides and skins to the number of 28,498,575, valued at £631,070, and 792,725 pounds of ostrich feathers, valued at £2,155,640, were exported in 1908-9. In 1907 the United States took feathers to the value of \$4,429,503; in 1908, \$4,304,518; in 1909, \$1,517,375.

Length of railways (December 31, 1908), 4242 miles; telegraph wires, 31,836; telephone wires, 5751; telegraph offices, 586; post-offices, 1065; postal savings-bank deposits, £2,654,062.

**GOVERNMENT.** The province is administered by an administrator (1910, N. F. de Waal), aided by a provincial council, elected for three years. There is an executive committee of four members. See **SOUTH AFRICAN UNION.**

**CAPE TO CAIRO RAILWAY.** See **EXPLO- RATION.**

**CAPE VERDE ISLANDS.** A group of 14 islands about 350 miles west of Cape Verde, constituting a Portuguese colony. Capital, Praia. Area, 1457 sq. miles; population (1900), 147,424 (3856 whites). Coffee, medicinal plants, sugar, millet, indigo, and tobacco are raised. Imports and exports in 1908 amounted to 2,096,273 milreis (1 milreis=\$1.08) and 354,781 milreis respectively, against 2,339,684 and 220,261 in 1907. In 1908, 1963 merchant vessels of 5,429,340 tons entered and cleared, exclusive of coasting trade. Estimated revenue and expenditure for 1909-10, 437,779 and 437,453 milreis respectively. Governor (1910), A. Moutinho.

**CAREY, AUGUSTUS C.** An American inven- tor, died Jan. 15, 1910. When about 21 years of age he entered the employ of the Hinckley- Drury Locomotive Works in Boston and for fif- teen years he worked in machine shops. At the end of that time he opened a shop of his own. In 1850 he took out a patent for a carpet sweeper. At the same time he began the in- dustry of manufacturing labor-saving devices. From that time on until his death he was oc- cupied with inventions and took out more than one hundred patents, chiefly of electrical and mechanical devices. He was at one time a mem- ber of the Massachusetts legislature. Among his most notable patents were attachments for machines used in the manufacture of woolen goods, electric lamps, wireless telegraph ap- paratus, devices for preventing head-on and rear-end railway collisions, and the coherer, which in 1896 was modified and used as a "de- tector" in wireless telegraphy by William Marconi.

**CARLETON, HENRY GUY.** An American playwright, soldier and inventor, died December 10, 1910. He was born at Fort Union, N. M., in 1856, his father, General James H. Carleton, being at the time stationed at this post. He studied at Santa Clara College, California, from 1865 to 1870, and in 1873 was appointed second lieutenant of the Eighth United States Cavalry. He served in several campaigns against the In- dians. In 1876 he resigned from the service and engaged in journalism. He acted as editor and special writer on several newspapers in New Orleans, Chicago and New York until 1889, in the meantime doing much dramatic writing. He began his dramatic writing at a very early age, his first play, *The Age of Gold*, having been written when he was 15 years old. In 1880 he wrote a tragedy, *Memnon*, which was ac- cepted by John McCullough, but was never pro- duced. His next play, *The Lion's Mouth*, was produced by Frederick Warde in 1891, and in 1894 Leslie Wallack produced *Victor Durand*, which was a success. Then followed *The Pem- berton's*, *Princess of Eric*, *The Gilded Fool*, *The Butterflies*, *A Bit of Scandal*, *Colinette*, and *The Girl From Maxim's*, which was his last play produced. The best known of his plays is prob- ably *A Gilded Fool*, in which N. C. Goodwin made a success. Mr. Carleton was also inter- ested in chemistry and was the inventor of several devices for safety from coal mine fires and explosions.

**CARLISLE, JOHN GRIFFIN.** American law- yer and public official, Secretary of the Treasury under President Cleveland, died July 31, 1910. He was born in 1835 in Cambell (now Ken- ton) county, Ky., and was educated in the pub- lic schools of the State. He taught school and in his leisure time studied law. He removed to Covington and became a clerk in the law office of Governor J. W. Stevenson. In 1858 he was admitted to the bar. He had already become familiar with politics and in 1859 was elected to the lower House of the Kentucky legislature, where he served four terms. He was elected to the State Senate in 1868 and was re-elected to that body. In 1868 also he was a delegate at large to the National Democratic Convention

and in 1876 was one of the alternate Tilden electors at large from Kentucky. From 1871 to 1875 he was lieutenant-governor of Kentucky. He was elected to Congress in 1877 and was re-elected for successive terms until 1891. From 1883 to 1889 he was Speaker of the House. On the death of Senator Beck he was elected United States Senator and resigned from the House of Representatives in order to accept this seat. He took an active part in the political campaign of 1892, and on the election of Mr. Cleveland accepted the portfolio of the Treasury. In 1896 a movement was started to boom Mr. Carlisle for the Democratic presidential campaign at the next national convention. He declined, however, to be a candidate, although he took part in the campaign which preceded the election. He was opposed to the political doctrines of Wm. J. Bryan, and once when speaking at a meeting in Covington he was mobbed by a hostile assembly of the admirers of Bryan. At the expiration of his term of office as Secretary of the Treasury, he resumed the practice of law in North Carolina. He later removed to New York City and remained there practicing law until the time of his death. He was a strong opponent of Imperialism and was Vice-President of the Anti-Imperialist League.

**CARNEGIE FOUNDATION.** See UNIVERSITIES AND COLLEGES.

**CARNEGIE GEOPHYSICAL LABORATORY.** See CARNEGIE INSTITUTION.

**CARNEGIE INSTITUTION OF WASHINGTON.** An institution founded in 1902 by Mr. Andrew Carnegie, who gave to a board of Trustees \$10,000,000 for its foundation. To this endowment fund was added in 1907 by Mr. Carnegie, \$2,000,000. The object of the institution is the promotion of investigation in the "broadest and most liberal manner." Many projects in widely different fields of inquiry have been considered or are being considered by the executive committee of the institution. These projects are chiefly of three classes, namely: First, large projects or departments of work whose execution requires continuous research by a corps of investigators during a series of years. Ten such departments have been established by the institution. With the names of their respective directors they are as follows: Department of Botanical Research, Dr. D. T. MacDougal, Tucson, Arizona; Department of Economics and Sociology, Professor H. W. Farnham, Yale University; Department of Experimental Evolution, Dr. C. B. Davenport, Cold Spring Harbor, L. I.; Geophysical Laboratory, Dr. A. L. Day, Washington, D. C.; Department of Historical Research, Professor J. F. Jameson, Washington, D. C.; Department of Marine Biology, Dr. A. J. Mayer, Dry Tortugas, Florida; Department of Meridian Astronomy, Dr. Lewis Boss, Dudley Observatory, Albany, N. Y.; Solar Observatory, Professor George E. Hale, Pasadena, Cal.; Department of Terrestrial Magnetism, Dr. L. A. Bauer, Washington, D. C.; Nutrition Laboratory, Dr. F. G. Benedict, Boston, Mass.

The second class of projects are those which may be carried out by individual experts in a limited period of time. Many grants have been

made by the institution in aid of such projects. The third class includes research associates and assistants. Under this head aid has been given to a considerable number of investigators possessing exceptional abilities and opportunities for research work.

From its organization in 1902 up to and including 1910, nearly 1200 individuals have contributed in one way or another to the promotion of the researches and publications undertaken by the institution. In addition to the larger departments of its work, numerous special researches, in aid of which upwards of 700 grants have been made, have been carried on by research associates and other individual investigators. For the departments of research, two astronomical observatories, five laboratories and a non-magnetic ship have been built and equipped, while the divisions of administration and publication have been provided with adequate quarters in the Administration Building in Washington, completed in 1909.

**SPECIAL DEPARTMENTS.** During 1910 work in the ten specially organized departments of research in the institution went forward with increasing vigor and productivity. The director of the Department of Botanical Research, which is located in a desert area, continued his investigations during the year on the water-balance of succulent plants, on the conditions of vegetable parasitism, on the variability of plant species induced by chemical treatment of their seeds, and on the influences of climate on plant organism. A general climatological study of the region about Tucson was carried on during the year and investigations of root systems and habits of desert plants were continued.

**EXPERIMENTAL EVOLUTION.** In the Department of Experimental Evolution, from the scientific point of view, the most interesting feature of the work during 1910 is found in the introduction of statistical and other quantitative methods, whereby biology is now passing from the first to the next higher stage in the development of science. From the more popular point of view this work is of special interest by reason of its bearing on the economics of plant and animal breeding and by reason of the light it is certain to shed on the laws of human heredity. For the needs of this department the institution purchased in January, 1910, a tract of 21 acres of very desirable land near the laboratory.

**ECONOMICS AND SOCIOLOGY.** Professor Farnham succeeded to the directorship of the Department of Economics and Sociology on the death of Dr. Carroll D. Wright. The work of this department during the year was a continuation of the plans begun by Dr. Wright. Several volumes of publications arising directly or indirectly from the investigations of the department were issued during the year. Two volumes of the Index of Economic Material in the Documents of the United States, those for Delaware and Kentucky, were also issued in 1910.

**HISTORICAL RESEARCH.** The Department of Historical Research published several volumes in 1910. One of the most interesting and valuable of these was published under the title *List of Documents in Spanish Archives Relating to the History of the United States, Which have been Printed or of Which Transcripts are Preserved in American Libraries*. Two other works of similar import were in press in the latter part of the year, namely, *Guide to the Materials for*

*American History in Roman and Other Italian Archives and Inventory of the Unpublished Material for American Religious History in Protestant Church Archives and Other Repositories.* Manuscripts are also prepared for the *Guide to Materials for American History in German Archives* and the *Guide to the Materials for the History of the United States in Mexican Archives.* The material in the archives of Paris is also being examined with a view to publication, and a guide to British materials is in process of rearrangement.

**GEOPHYSICAL LABORATORY.** The work of the Geophysical Laboratory has been in the main preliminary, but comprises chiefly the steps required to pass from a merely descriptive knowledge of rock formation to a knowledge based on definite measurements. Twenty-five publications came from the hands of members of its staff during the year. Many of these papers were published in German as well as in English.

**MARINE BIOLOGY.** The Laboratory of the Department of Marine Biology was damaged by the hurricane of October 14-18, 1910. This department published during the year a comprehensive monograph in three volumes by Dr. Mayer on *The Madusa of the World*, and two other volumes were passing through the press at the end of the year.

**MERIDIAN ASTRONOMY.** The Observatory of the Department of Meridian Astronomy which is being constructed in Argentina went forward rapidly in 1910 and this will be completed in 1911. Supplementary observations of the positions of the stars were carried forward in 1910 and arrangements for the final computations of these positions were proceeding at the Dudley Observatory. The department issued during 1910 a catalogue of 6188 stars for the epoch 1900. This is preliminary to the great catalogue of stellar positions projected by the department. The director also published a list of 1059 standard stars for 1910.

**NUTRITION LABORATORY.** The Nutrition Laboratory, although it has been in operation less than two years and is not yet fully equipped, has already produced contributions of fundamental importance to the knowledge of chemistry, physics, physiology and the pathology of nutrition. Of the many investigations carried on, one of the most important was an investigation in which decided progress has already been made, but which may yet require many years to complete—the nature and meaning of metabolism in diabetes. The preliminary results of this research were published during the year. One new calorimetre was completed and another partly constructed in 1910. These were described in the publications issued by the director.

**MT. WILSON OBSERVATORY.** At the observatory of the institution at Mount Wilson, several large pieces of apparatus for the new tower telescope, for the 60-inch telescope and for the 100-inch grinding machines were completed during 1910. The towers for the new 100-foot telescope, begun in 1909, were completed, together with the well, 75 feet deep in the rock below, which forms a part of the telescope tube of this instrument. Progress was made during 1910 in the details of designs for the proposed 100-inch or Hooker telescope. The International Union for Coöperation and Solar Research held a meeting at the observatory from August 29 to September 4, 1910. This meeting is regarded as the most important meeting hitherto held by the

Union. Numerous investigations are under way at the observatory and at the Physical Laboratory at Pasadena.

**TERRESTRIAL MAGNETISM.** The work carried on by the Department of Terrestrial Magnetism is of the greatest practical as well as theoretical importance. Its purposes include a magnetic survey of the earth, together with a deeper knowledge of the earth's magnetism and its cosmic connections. The most striking event of the year in this department was the trip of the non-magnetic ship *Carnegie*, which sailed on her first cruise in 1909. In her first voyage, which was from Falmouth, England, to Funchal, Madeira, thence to Hamilton, Bermuda, and thence to Brooklyn, N. Y., this vessel proved more effective even than was anticipated. She was able to discover errors of unexpected magnitude in the best sailing chart of the North Atlantic. (See **TERRESTRIAL MAGNETISM.**) This department also completed early in the year an expedition in Africa from the Cape to Cairo. In this expedition a total of 384 stations were occupied. Work in Turkey, Palestine, Syria and Arabia and in the islands of Rhodes and Cyprus was also carried on and work was begun in South America. In the special research departments of the institution about 50 associates carried on investigations during the year, either by aid of grants made directly to the individuals concerned or to organizations. These investigations included nearly every branch of learning and science.

**PUBLICATIONS.** The institution issued 20 publications, including pamphlets and monographs, during the year. The President of the institution is Robert S. Woodward; Chairman of the Executive Committee, William H. Welch, and Chairman of the Finance Committee, Seth Low.

**CARNEGIE PEACE FUND.** See **ARBITRATION, INTERNATIONAL.**

**CARNEGIE, THE.** See **TERRESTRIAL MAGNETISM.**

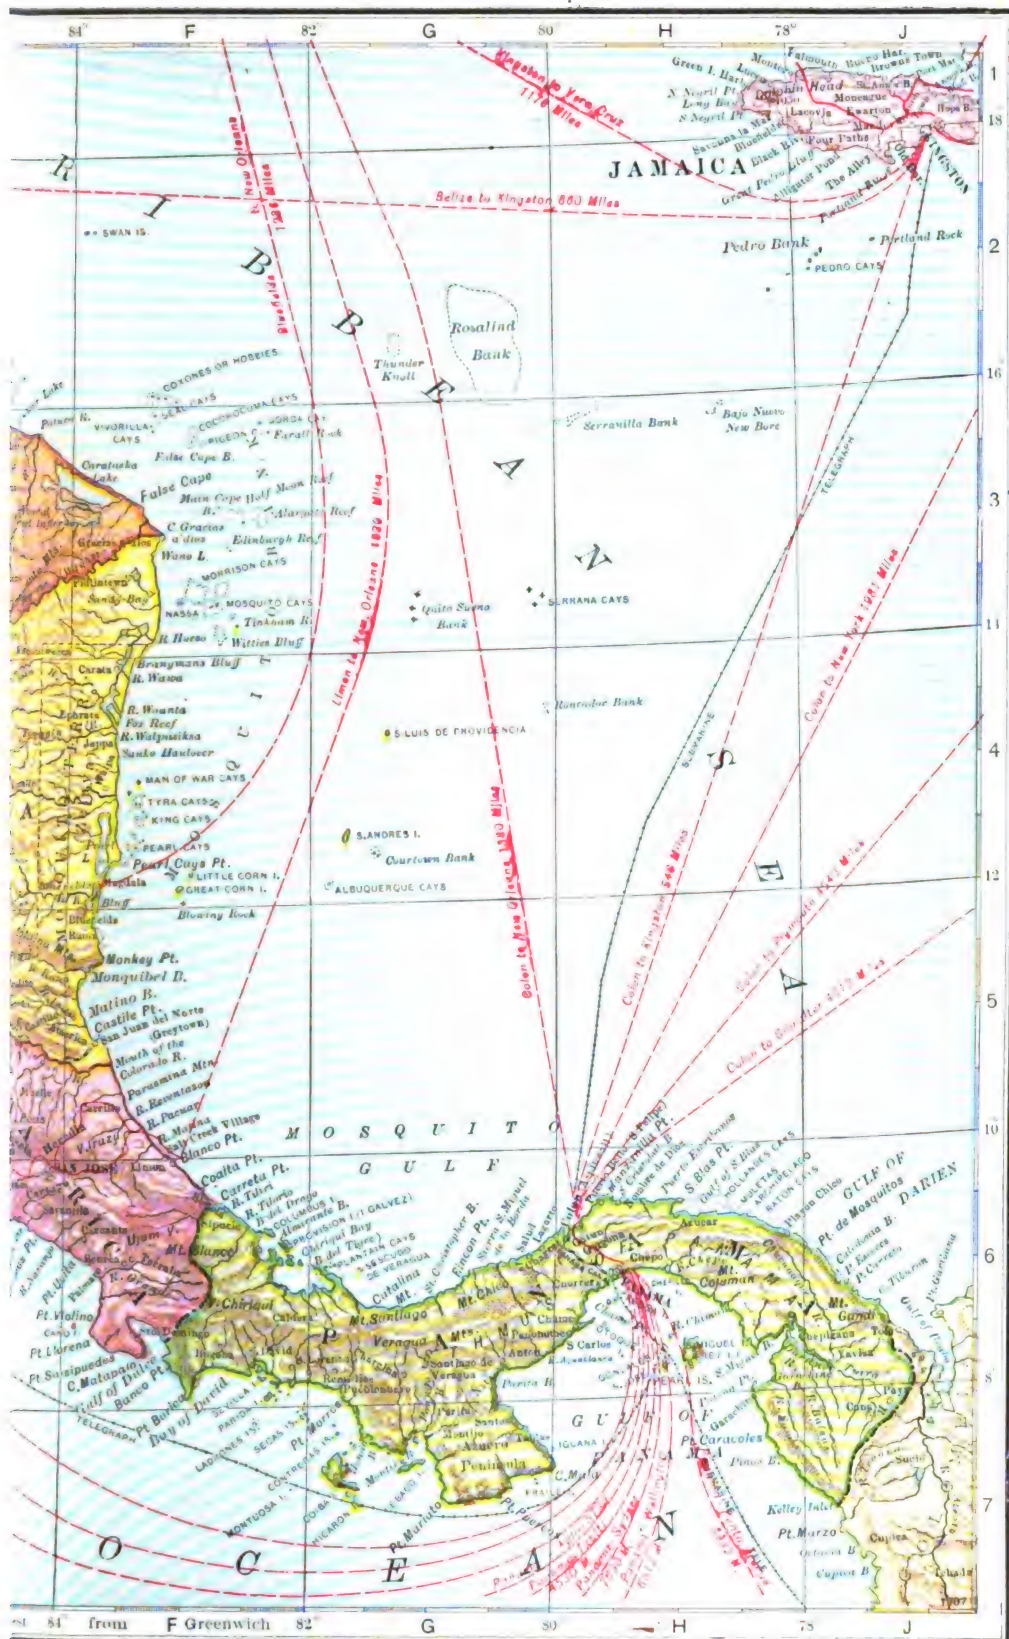

**CARNEY, HUGH J.** An American Roman Catholic clergyman and economist, died March 20, 1910. In 1855 he joined the Christian Brotherhood at Montreal. At the outbreak of the Civil War he was in Rock Hill College, Baltimore, and from there was transferred to Manhattan College, New York City. From there he went to Waterford, Ireland, where he held the chair of mathematics for six years at the Normal College in that city. On his return to the United States in 1896 he was appointed professor of economics at Manhattan College, and he retained this position until he was obliged to retire on account of ill health.

**CAROLINE ISLANDS.** A German possession, forming part of the German New Guinea Protectorate, and made up of the Caroline, Pelew, and Marianne (or Ladrone) Islands, (Guam excepted), all lying north of New Guinea. Area between 560 and 600 sq. miles. Ponapé is the capital of the Eastern and Yap of the Western groups including the Pelew and Marianne Islands. Total population (estimated), 55,000; whites in 1908, 257. Total imports and exports (1908), 615,456 and 329,637 (chiefly copra) marks respectively. Total vessels entered (1906), 87, of 33,274 tons. Estimated expenditure, including the Marshall Islands, 577,000 marks. The administrator (under the governor of German New Guinea) at Ponapé was in 1910 M. Boeder; at Yap, M. Fritz.

- CATHOLIC UNIVERSITY OF AMERICA.** An institution of higher learning under the auspices of the Roman Catholic Church, founded in Washington, D. C., in 1885. There are faculties of philosophy, letters, sacred science, law and science. The undergraduate department of the university was opened in 1902. There are connected with the university the following non-affiliated undergraduate colleges: Marist, Juniorate and the College of St. John Canty. In 1909-10 the registration of students in the university was about 400, while the faculty numbered 46. During the year Rev. George H. Dougherty, D. D., was elevated by the board of trustees to the vice-rectorship of the university. The following members of the faculty were promoted from associate professors to ordinary professors: Rev. P. J. Healy, professor of Church History; Joseph Dunn, Ph. D., professor of Celtic Language; Rev. Thomas E. Shields, Ph. D., professor of Psychology. A new professor, Fred J. Merriman, was appointed in the department of Civil Engineering to succeed Francis J. Thompson, who resigned. The university made an important departure by adding to its school of sciences a course in architecture. At the head of this department is Frederick V. Murphy. Several additional instructors were appointed in the school of letters and an additional professor was appointed in the school of Oriental languages, Rev. Arthur A. Vaschalde. All departments of the university showed growth. A new central heating plant was under contract at the end of 1910, and the upper floors of this will afford lecture rooms for the classes in mechanical and electrical engineering. A new gymnasium has also been erected. The library contains about 70,000 volumes. At the beginning of 1911 a new publication will be issued, to be known as the *Catholic Educational Review*. The productive funds in 1909-10 amounted to \$998,445 and the income to about \$35,000. The rector is the Right Reverend T. J. Shahan, D. D.

- CECIL, Lord WILLIAM.** See LITERATURE, ENGLISH AND AMERICAN, *Essays and Literary Criticisms*.
- CELL.** See BOTANY and BIOLOGY.
- CELTIC PHILOLOGY.** See PHILOLOGY.
- CEMENT.** Statistics of cement production in 1909 were gathered and published by the United States Geological Survey in 1910. According to this authority the total production of Portland, natural and puzzolan cements produced in the United States during 1909 was 64,196,386 barrels, valued at \$51,232,979. This may be compared with the production in 1908 which was 52,910,925 barrels, valued at \$44,477,653. The increase in quantity is the largest ever recorded, but the failure of the increase in value to keep pace with the increase of production is significant of the trade conditions which the cement industry encountered during 1910. Of the cement produced, Portland cement amounted to 62,508,461 barrels valued at \$50,510,385; natural cement, to 1,529,279 barrels valued at \$623,141. Pennsylvania produced far in excess of any other State and was followed in the order named by Indiana, Kansas, Illinois, New Jersey, Missouri, Michigan, California, Washington, New York and Ohio. Other States produced less than 1,000,000 barrels. The total number of plants in operation in 1909 was 103 as compared with 98 in 1908. The largest quantity of natural cement was produced in New York, with Pennsylvania second and Indiana and Illinois combined, third. There were imported for consumption into the United States in 1909 443,888 barrels of cement, of which at least 95 per cent. was Portland cement. The exports, consisting also almost entirely of Portland cement, amounted in 1909 to 1,056,922 barrels.
- Business conditions in the cement industry in 1910 were so unfavorable that only the best equipped plants would make even a moderate profit, and this notwithstanding an advance of 10 cents per barrel in price made by the Licensees' Association in July. The cement manufacture has suffered from over-production. At the end of December the dissolution of the Association of Licensed Cement Manufacturers was announced. It was followed immediately by a cut of price to 85 cents per barrel at the mills. The price established in July was \$1.25 a barrel.

- CENTRAL BANK.** While the discussion of currency and banking reform was not as voluminous as it had been in 1909 there were nevertheless a considerable number of articles and addresses on the subject. A National Conference on the Currency Problem was held under the auspices of the Academy of Political and Social Science at Columbia University, in November. In his address at this Conference Theodore Marburg held that central banks are not oligarchic but democratic institutions; for

they establish conditions which protect the small banks from the dominance of large ones. Holding that the fundamental need in this country is the centralization of bank reserves without the destruction of decentralized banking power, he laid down the following principles: 1, cash reserves should be centralized so as to be available when needed, and withdrawn, not from lack of confidence, but for actual circulation or exports; 2, banks should be able to build up an available reserve with the central institution by means of commercial paper; 3, commercial paper should be the chief basis of loans instead of stocks and bonds; 4, the central institution should serve as an inter-city clearing house; 5, notes partly secured by gold should be given only to the central institution, thus strengthening its reserve power and increasing its control over the expansion of credit; 6, the function of making money and of issuing money should be completely separated. Mr. Charles A. Conant, writing in the *North American Review*, argued for a central bank on the ground that every commercial nation has arrived at it by a process of evolution. He held that the organization of a central bank is in harmony with the general movement toward concentration in commerce and industry. He pointed out that even those countries which do not have a central bank in form do have it in actuality. Thus, in Scotland, there is reliance upon the Bank of England, in times of distress; in Canada, the system centres about the Bank of Montreal, which, with its branches, holds one-fifth of all the banking assets of Canada; and in Mexico, the National Bank holds two-fifths of the assets of all banks of issue.

Mr. Victor Morawetz, writing in the same magazine, pointed out that, while the present system cannot be wholly vicious since the United States has greatly prospered under it, yet we need a system that will be always safe and useful. The chief lack of our present system, in his opinion, is some means of checking the expansion of bank credits. This is done in Europe by means of a central bank. It could be done in this country by such a bank which acted as a common depository of reserves and as the sole depository of government funds, and which had a monopoly of note issues. He pointed out that such a bank could pursue one or both of two plans. First, it could rediscount commercial paper, thus controlling interest rate and the expansion of credit. Secondly, it could control note issues so as to prevent the withdrawal of gold for use as a circulating medium and, on the other hand, so as to prevent an undue expansion of loans. The central banks of France and Germany use both of these methods; the Bank of England uses only the first. Though a central bank may be quickly created by act of Congress, Mr. Morawetz expressed his opinion that many years of experience would be needed to bring about its suitable adjustment to commerce, industry, and public opinion.

A modification of the central bank idea was presented by Mr. Charles D. Dawes, in the *World To-day*. He pointed out as weaknesses of the present system the inelasticity of the currency; the undue shrinkage of credit in times of panic; the lack of a central control over improper tendencies of speculation; the inadequacy of means of discouraging gold exportation and the absence of facilities for mobilizing bank reserves in critical times. While he ex-

pressed himself in favor of an asset currency, he pointed out that this does not provide for the check of undue expansion of credits, but, on the contrary, may actually further it. Such a check is afforded by a central bank which holds reserves and can raise discount rates. But, Mr. Dawes contended, a central bank in this country cannot be protected from legislative or demagogic attacks which would undermine its credit and thus destroy its usefulness. He, therefore, concluded in favor of some plan for the issue of notes by national banks on joint credit as proposed by Mr. Morawetz in his book, *The Banking and Currency Problem in the United States*. By this plan national banks would form an association for the sole purpose of issuing notes on joint credit. While the association itself would have neither capital nor deposits, its members would have at least 250 million dollars aggregate capital. There would be a board of managers of from fifteen to twenty-one members. The volume of notes and the reserve against them would be controlled by the government through the Secretary of the Treasury. The association would have headquarters at Washington and branches in every large city. The board, with the Secretary of the Treasury, would fix the limit of note issue for the several banks. Mr. Dawes pointed out that such an association could influence the interest rate by increasing or decreasing the reserve against notes. This would supply elasticity to the currency, regulate banking and commercial credits, perfect the system of bank reserves, control the movement of gold and, while securing the benefits of the central bank, would reduce the probabilities of political attacks. The only modification which Mr. Dawes would make in this plan would be to remove the power of the Secretary of the Treasury over the reserve to be held against association notes; because, he held, the Secretary might be influenced through political consideration, to heed the demand of powerful business men for an undue expansion of credits.

Still another statement of defects and needed reforms was made by Congressman Vreeland, Chairman of the House Committee on Banking and member of the Monetary Commission. He stated in the *Independent* that our 24,000 banks are so many separate units without any coördinating control in times of financial stress. The currency lacks elasticity, so that it is redundant at times, piling up in New York and furnishing a basis for bull movements on the stock exchange, and scarce at other times when greatly needed for legitimate business transactions. The bank-note system is eccentric, depending on the price of bonds rather than on business demands. The reserve system is bad, for each bank is required to have its own reserve; in this way about 1,400,000,000 dollars are kept in idleness. Prof. O. M. W. Sprague in the *Quarterly Journal of Economics*, stated that the character of security for bank-note circulation is less important than commonly assumed. While favoring an asset currency he contended that such cannot be made very elastic, until the banks can agree to pay less interest on deposits. Such interest payments concentrate deposits in financial centres and at the same time force city banks to expand their loans up to the legal limit.

At the meeting of the American Academy of Political and Social Science at the University

of Pennsylvania in December, Senator Aldrich, Chairman of the National Monetary Commission, pointed out the advisability of one national system of banks for the entire country. He stated that we might have one class of national banks for a commercial business, another doing a savings bank business, and another doing a trust business. He thought that reform in this country must take the direction not of a central bank competing with already existing institutions, but of some association superimposed on existing banks. This might take the form of one great central association or of separate associations for different sections of the country, with or without federation. Such an association of banks should insure steady rates of interest, prevent bank suspensions and extend credit to worthy banks and business concerns. At the same time Hon. A. Piatt Andrew, the secretary of that Commission, pointed out three fundamental differences between American and European banking systems. In the first place European banks have more coherency, whereas individualism is carried to an extreme in this country; the result is that the American banking system is more easily demoralized in times of panic. In the second place the reserves in European banks are more available and more active, because each individual bank keeps the main body of its reserve with some central institution. In the third place the tendency in Europe has been toward a concentration in the control of note issues; this makes possible a better adjustment of currency supply to currency demand. He thought these three principles should furnish the basis for the constructive programme of the National Monetary Commission. See **BANKS AND BANKING, NATIONAL BANKS, AND FINANCIAL REVIEW.**

**CERIUM.** See **ATOMIC WEIGHTS.**

**CERTIFICATES OF INDEBTEDNESS.**

See **BANKS.**

**CEYLON.** An island in the Indian Ocean, laying south of Hindustan; a British crown colony. Capital, Colombo.

**AREA AND POPULATION.** Area, 25,332 square miles. Population (1901), 3,565,954; estimated, December 31, 1908, 4,038,456; 1909, 4,082,935. The birth rate in 1909 was 36.7, the death rate 30.3 per 1000. Immigrant laborers (1909), 80,718. Colombo had (1901), 158,228 inhabitants; Galle, 37,316; Jaffra, 33,879; Kandy, 26,519.

**EDUCATION, ETC.** In 1908 the government schools numbered 648, with 80,986 pupils; grant-in-aid schools, 1782, with 179,929 pupils; unaided schools, 1549, with 26,180 pupils; government expenditure, £89,833. The technical college had 164 students. The Royal College receives grant-in-aid, and there is a government training college. There are also 37 industrial schools and orphanages.

The Buddhism of Ceylon differs materially in doctrine and practice from that of Tibet, China, and Japan. The Buddhists numbered, in 1901, 2,141,599; Hindus, 828,622; Mohammedans, 248,140; Christians, 362,018.

**PRODUCTION.** According to the last census (1901), 65.8 per cent. of the population are engaged in agriculture. In 1903, the area under cultivation was given at 2,773,657 acres; under pasture, 662,152. Area planted to rice (1909), 678,194 acres; other grains, 104,554; tea, 535,891; coffee, 1769; cocoanuts, 1,035,863; rubber,

154,460; cinchona, 263; cinnamon, etc., 47,906; cacao, 36,324; tobacco, 15,108. Total quantity of rubber sold in 1908, 7808 cwt.; in 1909, 13,621. The livestock (1908 estimate) included 1,635,456 cattle, 3643 horses, 100,603 sheep, 174,072 goats, and 93,371 swine. The rinderpest epidemic carried off 70,940 head of cattle in 1909. The government dairy and model farm has over 200 head of cattle brought from Scinde.

In 1908 there were 648 plumbago mines and 3303 gem quarries. The export of graphite was 643,853 cwt. in 1909; 516,316 in 1908. Gold, monazite, thorium, and mica also occur. The pearl fisheries are leased to a company at an annual rent of Rs. 310,000 (1 rupee=33.44 cents). There was no pearl fishery in 1909, though the annual rental was paid, and Rs. 73,298 were expended by the company in experiment and research. The government realized Rs. 1,520,648 in 1909, Rs. 1,760,552 in 1908, from salt sales (salt is a government monopoly). Native industries include weaving, woodcarving, and the manufacture of jewelry, pottery, lacquer, tortoise-shell ornaments, and earthenware.

**COMMERCE.** The total imports and exports in 1909 (exclusive of specie, but including coal exported for use of steamers) were valued at Rs. 125,441,00 and Rs. 146,879,000 respectively (Great Britain, 26. and 49.2 per cent.; British possessions, 61.7 and 15.5; other countries, 12.3 and 35.3). The origin of imports is seen in the following three-year table:

	1907 Rs.	1908 Rs.	1909 Rs.
British India .....	60,468,700	54,137,900	51,078,100
Great Britain ....	32,628,000	32,329,000	32,376,100
Straits Settlements ..	2,904,100	9,906,500	13,073,200
Burma .....	4,045,800	3,049,100	5,574,500
Germany .....	2,921,100	2,826,400	3,296,500
Maldiv Islands.....	2,267,000	2,033,200	2,455,000
Hongkong .....	1,152,600	1,789,000	2,407,000
Japan .....	1,507,000	1,818,700	1,713,500
United States....	1,002,400	1,097,500	1,077,000

The principal exports, their value in 1908 and 1909, and the countries of destination, are shown in the following table:

	Great Britain	British Colonies	Other Countries
Tea	1908..44,811,900	14,178,700	14,562,700
	1909..50,608,400	15,253,900	15,149,900
Cocoanut prods.	1908..10,436,600	1,393,200	17,507,500
	1909..10,541,100	1,104,500	20,843,000
Plumbago	1908..2,476,900	62,100	5,464,600
	1909..1,964,600	60,500	7,954,500
Rubber	1908..2,243,700	173,700	1,189,500
	1909..5,080,298	126,282	3,169,023
Cinnamon	1908..259,000	56,000	2,298,800
	1909..301,000	53,900	2,374,700
Cacao	1908..1,890,200	187,400	585,800
	1909..1,954,300	173,300	640,100
Citronella oil	1908..443,600	84,500	515,600
	1909..565,900	44,000	523,300
Areca nuts	1908..11,000	2,089,800	81,900
	1909..1,900	2,274,900	101,600

Total shipping (1907), 6,657,323 tons.

**COMMUNICATIONS.** The total length of railway lines open to traffic at the end of 1909 was 576½ miles, an increase of 10½ miles over the previous year by the completion of the last section of the Negombo line. Receipts for the year, Rs. 11,746,603; working expenses, Rs. 6,990,419. Capital expenditure to end of 1908, Rs. 86,795,-

000. Work was begun in November, 1909, on the Chilaw extension; expenditure in 1909 on the Ratnapura extension, Rs. 1,310,381; work on the Mannar link with India progresses rapidly. Length of telegraph wires, 4292 miles; telegrams sent in 1909, 744,175. Number of post-offices, 418.

**FINANCE.** The unit of value is the rupee, valued at 33.44 cents. The revenue and expenditure for 1909 amounted to Rs. 39,332,861 and Rs. 35,789,398 respectively, against Rs. 35,572,849 and Rs. 35,032,055 in 1908. Principal sources of revenue (1908): Government railways, Rs. 10,917,929; customs, 9,648,850; arrack, rum, and toddy licenses, 4,381,000; stamps, 2,047,988; port and harbor dues, 2,186,626; government timber and salt sales, 1,760,551; land sales, 1,024,130. Principal items of expenditure: Establishments, Rs. 10,588,487; interest on public works (annually recurrent and extraordinary), 7,158,429; on loans, 3,667,166; military, 1,978,898; pensions, etc., 1,608,539. Public debt, December 31, 1909, £4,444,381. The Ceylon Savings Bank (December 31, 1908) had deposits to the sum of Rs. 4,556,778. Post-office savings bank deposits, Rs. 2,201,177. The financial year of the colony will run in future from June to June; the statistics for revenue and expenditure are therefore the last for calendar years.

**THE MALDIVÉ ISLANDS** (17 coral islets) are tributary to the Ceylon government. They lie 500 miles west of Ceylon, are governed by a hereditary sultan residing in the island of Mali, and have a population of 30,000 Mahomedans.

**GOVERNMENT.** The colony is administered by a governor (1910, Sir Henry McCallum), assisted by an executive council of 5 members and a legislative council of 17.

An important franchise measure was under discussion in the legislature and reached its second reading in September. It provided for four seats in the Chamber based on the elective principle. The seats were to be held respectively by a European representative from the cities, a European representative from the country, an educated native Ceylonese, and a burgher. In November the Crown Prince and Princess of Germany paid a visit to Ceylon, arriving at Colombo on November 20.

**CHANUTE, OCTAVE.** An American engineer and scientist of French descent, died November 23, 1910. He was born at Paris in 1832 and came to the United States in 1838. He was educated at private schools in New York City.

From 1849 to 1863 he was civil engineer on various railroads and from 1863 to 1867 was chief engineer of the Chicago and Alton Railroad. He was connected with other railroads until 1883. He assisted in building the Chicago and Alton Railroad. Mr. Chanute early in his life became interested in aeronautics and originated the idea of biplane aviation. His work in perfecting the scientific side of aeronautics is very valuable. He was at one time President of the American Society of Civil Engineers and was a member of several other engineering societies in the United States and other countries. He was the author of *The Kansas City Bridge* (with George Morison, 1870), and *Progress in Flying Machines*, together with numerous papers and articles on engineering subjects.

**CHAPOWSKI, Countess BOZENTA.** See LITERATURE, ENGLISH AND AMERICAN, *Biography*.

**CHARCOT, JEAN.** See POLAR RESEARCH.

**CHARITIES AND CORRECTIONS, NATIONAL CONFERENCE OF.** See CHARITY.

**CHARITY.** One of the significant signs of the times is the great increase in charitable and philanthropic activities. This is only one phase of the world-wide humanitarian movement which is affecting the social life of every Western people. The new charity is more sympathetic with misery than the old and much wiser in dealing with it. The keynotes of modern methods are knowledge and organization. With the increase in financial resources, due mainly to the willingness of wealthy citizens to devote funds to the relief of the needy, organization of charitable agencies became necessary both for efficiency and for economy. Organization of city and State associations has been followed by numerous annual conferences. The scope of modern charities, as shown in the reports given herewith, is broad and varied; and there is a marked tendency toward prevention and constructive action as against the old plan of temporary relief. Moreover the view that social injustice and maladjustment rather than individual weakness are the prime causes of poverty and distress is steadily gaining ground.

**NATIONAL CONFERENCE OF CHARITIES AND CORRECTION.** The thirty-seventh annual conference met at St. Louis, May 19-20. The discussions well illustrated the increasing demand for a clear view of the essential facts, for a knowledge of causes, for a more definite location of responsibility for poverty, and the growing dissatisfaction with haphazard momentary relief. Thus consideration of relief for widows and orphans led directly to a discussion of industrial accidents, occupational diseases, and other general causes of widowhood. This latter was in turn made partly responsible for juvenile delinquency, as were also housing conditions, street life, and industrial work by mothers. The presidential address of Miss Jane Addams of Chicago on Charity and Social Justice developed the growth of the hatred of injustice as a factor in the betterment of social conditions. Noting that modern poverty and degradation are everywhere connected with unjust economic conditions or deteriorating social surroundings, she pointed to the many activities seeking to protect the weak from exploitation or to safeguard and enhance the life and welfare of the citizen. The general sessions of the Conference were devoted to consideration of the best means of caring for widows, wayward girls and women delinquents

and the blind. Special sections were devoted to the discussion of Families and Neighborhoods; Occupational Standards; Health and Sanitation; Law Breakers; Remedial Loans; School and Community; State Supervision and Administration; Children; and Publicity. Under Occupational Standards was brought out clearly the growing importance attached to the industrial factor in dependence; the need of standards of industrial hygiene; the development of standards of workmen's compensation for accidental injury or death (see EMPLOYERS' LIABILITY); the movement for wage standards and the fixing of minimum wages. Here was presented also a paper on *The Toxin of Fatigue*, by Dr. Henry B. Favill of Chicago, in which the so-called fatigue toxin, a poison said to be developed in the body by excessive labor, was shown to be as yet not fully demonstrated, though there can be no doubt of the deteriorating effects of undue wear and tear of the worker. Trade diseases were also discussed (see OCCUPATIONAL DISEASES). Under Health and Sanitation the first topic was medical inspection of schools, stress being laid on its relation to contagious diseases, and on ventilation as a means to vitality; the second was hospital social service, being a study of the new activities of city hospitals in attempting to alleviate the social and home environment of their patients; the third was on blindness, its relation to venereal diseases and the ignorance of mid-wives, and its prevention by proper medical attention at birth. The subject of Remedial Loans called attention to the new movement just gathering headway whereby the professional money-lender, the "loan shark" who thrives on small loans to needy workers, is to be driven out of business by loan societies and social agencies giving needed temporary aid. Fully a score of such agencies have been organized. Indeed the first annual meeting of the National Federation of Remedial Loan Associations met at this time and place.

The next Conference will meet at Boston, June, 1911, with Mr. Homer Folks of New York as president, and Mr. Alexander Johnson of Fort Wayne, Ind., as secretary.

THE NATIONAL ASSOCIATION OF SOCIETIES FOR ORGANIZING CHARITY, was formed at St. Louis, May 25. A permanent committee on organization was appointed to draw up a constitution and prepare a programme for the meeting at Boston, 1911. Its main purpose will be the extension of the charity organization movement.

NATIONAL CONFERENCE OF JEWISH CHARITIES. This met at St. Louis, May 17-19, in connection with the above National Conference. Registered delegates numbered 156. Prof. Jacob H. Hollander, the president, spoke on Forces and Tendencies in Jewish Charities; he justified the existence of separate Jewish charities by the mental, physical, and moral differences of the Jewish people. A report on Desertion classified causes under "other women" and "left to seek work." Desertion was found to be actually less frequent in hard times than in good, because of the greater activity of charitable agencies. The Industrial Removal Office was reported to have placed some 50,000 immigrants who had settled in New York, 85 per cent. of whom stayed where placed. Other topics were Legal Aid, Boarding Out Jewish Children, Pensioning Widowed Mothers, Education for Delinquent Children, Social Work as a Profession. The Section of Jewish Social Workers met at the same time

and place. Mr. Lee K. Frankel, New York, was chosen president for 1911 and Mr. Louis H. Levin, Baltimore, secretary.

THE FIRST NATIONAL CONFERENCE OF CATHOLIC CHARITIES met at the Catholic University, Washington, D. C., September 25-27. Delegates from many States were in attendance and a great variety of subjects were discussed. Among these were: Recognition of the Religion of Dependents of the State; Protection of Young Girls; The Dependent Family; The Church and Social Reform; Delinquency; Tuberculosis Among the Poor; Social Settlements; Schools of Philanthropy; Legal Aid for the Poor. Coöperation with other societies and with the National Conference, the Consumers' League, and The Child Labor Committee was advocated. Cardinal Gibbons was made honorary president; Monsignor T. J. Shahan, rector of the Catholic University, president; and Dr. W. J. Kerby of the same university, secretary. The second conference will meet in Washington, D. C., September, 1912.

OTHER CONFERENCES. The *Western Reserve Conference on the Care of Dependent and Neglected Children* met at Cleveland, November 17-19, at the call of twenty child-caring institutions. The topics discussed were the dependent child and the institution; the dependent child and the foster home; and coöperation of child-caring agencies. About 1400 persons attended the sessions. Forty-five organizations participated and forty-one exhibits were shown. Among these were those of the Children's Aid Society of Boston, the National Child Labor Committee, the Child Helping Department of the Russell Sage Foundation, and the Speedwell Society. The recommendations emphasized the value of home life and of constructive work in the home of such children; the superiority of the foster home over the public institution unless the child be defective; the need of expert physical examinations, and careful preliminary investigation. The chairman, Mr. James R. Garfield, appointed a committee to arrange for future conferences, and steps were taken toward the formation of a central committee on child welfare.

The eleventh *New York State Conference on Charities and Corrections* met at Rochester. Mr. George A. Lewis was president. The principal topics considered were congestion of population and the social evil; but some attention was given to public institutions and public coöperation; problems of widowhood; prevention and treatment of infant blindness; and sweatshops. The 1911 conference plans to meet at Watertown, November 14-16; president, Rev. Dr. Max Landsberg of Rochester; secretary, John A. Kingsbury of New York.

The *First Annual New York City Conference* was held in May, under the presidency of Robert W. Hebbard, former Commissioner of the City Department of Charities. The Congestion of Population (q. v.) was made the foundation fact in problems of poverty, ill-health, disease, and bad social conditions in the city. Dr. J. S. Billings of the Health Department found a death rate among children of 87 per 1000 in an Italian block with 9426 people, while the rate for the city was 51. Likewise the most congested block had an average of 362 tuberculous patients during 15 years, while a good block had only 16. In the discussion of the Care of Children in institutions it was brought out that institution children often have better food, health, educa-

tion, and industrial training than those in congested quarters. The cottage plan was strongly endorsed. In the session on the Care of Families, the establishment of a legal minimum wage was advocated as the prime requisite for the eradication of poverty. This view was opposed by Wm. I. Nichols of the Brooklyn Bureau of Charities, who found in the industrial agency, whereby work of some suitable kind is found or provided, a means of testing the worthiness of the applicant for aid. Dr. Lee K. Frankel, on the other hand, thought such agencies should be used only for the handicapped and that insurance against unemployment and old-age pensions should be established. Under Reports on New York Institutions, farm colonies for vagrants, improved institutional care for inebriates, homes for semi-delinquent men and boys, after-care for discharged prisoners, study of atypical children in school as a preventive of insanity, prophylactic work in cases of alcoholism and venereal diseases, less crowding in insane hospitals, and better sanitation were advocated. Fresh Air Charities were shown to number 138, all engaged in getting different classes to the sea shore or to the country for brief spells of recreation and recuperation.

Other State conferences were held at Frankfort, Kentucky, Lincoln, Nebraska, and Camden, New Jersey, in February; at Hartford, Connecticut, and Mankato, Minnesota, in March; at Marion, Indiana, in September; at Chicago, Illinois, Portland, Maine, and Pawtucket, Rhode Island, in October; at Des Moines, Iowa, Frederick, Maryland, Chillicothe, Missouri, and Altoona, Pennsylvania, in November.

**BEQUESTS.** *The Rockefeller Foundation.* In March a charter was sought from Congress for a corporate body consisting of John D. Rockefeller, John D. Rockefeller, Jr., Frederick T. Gates, Starr J. Murphy, Charles O. Heydt, and such other persons as they might associate with themselves, to be known as the Rockefeller Foundation. This body was to have power to choose its successors in perpetuity. It was generally understood that Mr. Rockefeller was to endow it with a sum immensely larger than any yet devoted to social uplift. The purpose was stated thus: "To promote the well-being and advance the civilization of the peoples of the United States and its territories and possessions and of foreign lands in the acquisition and dissemination of knowledge; in the prevention of suffering; and in the promotion of any and all the elements of human progress." The charter sought exempted the foundation from taxation.

The wide discussion of this proposal and the uncertainty regarding its real purposes and probable effects caused hesitation in Congress in granting the charter. *The Survey*, the leading philanthropic journal, led the demand for limitations of the charter privileges. It suggested that the government be given a voice in the selection of trustees; that the corporation be required to spend its income so as to prevent an indefinite increase in its endowment; and that by the end of say 100 years the entire project be brought to an end by the expenditure of the endowment itself. Upon the opening of Congress in December Senator Gallinger offered the following amendments: that the successors to the incorporators be chosen by the President of the United States, the Chief Justice of the Supreme Court, the President of the Senate, the

Speaker of the House, and the presidents of Harvard, Yale, Columbia, Johns Hopkins, and the University of Chicago; that Congress have power at any time to impose limitations on the objects of the corporation; that the endowment shall not exceed \$100,000,000; and that after 100 years Congress may direct the corporation to distribute the principal of its endowment. The charter had not been granted by the close of the year.

*The New York Foundation.* This institution was chartered to "promote charitable, educational and philanthropic enterprises." It was endowed by Alfred M. Heinsheimer with \$1,000,000, which had been previously offered by his brother to the Jewish charities of New York on condition that they form a federation. The trustees, besides the donor, are Morris Loeb, Paul M. Warburg, Jacob H. Schiff, and Isaac N. Seligman.

**OTHER COUNTRIES.** *The Eleventh Annual Canadian Conference of Charities and Correction* met at Guelph, Ontario, in July. In speaking of wayward women Miss Brooking of a Toronto maternity hospital stated that more than one-half the unmarried mothers treated there were feeble-minded. The criminal, the curative work of the Guelph Farm Colony, the crusade against tuberculosis, sex instruction for boys, intemperance were discussed. The conference adopted a resolution favoring medical certification of physical and mental fitness for marriage; and one on the necessity of making parents responsible for the criminality of children under twelve years. The 1911 session will be held at Hamilton.

**GREAT BRITAIN.** Nowhere else is the problem of poverty being dealt with on such a large and far-reaching plan as in Great Britain. The report of the Royal Commission on Poor Laws and the Relief of Distress, submitted in 1909, brought forward many issues. The majority and minority reports agreed in desiring prevention in place of relief and in making unemployment largely responsible for poverty. But the majority would change the existing system of administration only slightly while the minority advocate breaking up the entire system. The Development Bill, designed in part to provide public work in afforestation, highway and other improvements, and the Labor Exchanges (q. v.) opened in February, were part of the plans for relieving unemployment. But it was shown by the minority that only one-tenth of those seeking public aid were able-bodied. Nine-tenths were aged, sick, physically unfit, children, or widows with children. Old-age pensions have provided for the aged, but the treatment of others has been left unchanged.

*The National Committee for the Prevention of Destitution*, headed by Sidney and Beatrice Webb and having 30,000 members, is seeking to secure laws that will revolutionize the treatment of poverty in Great Britain. The active propaganda of this Committee is in support of a prevention of destitution bill introduced in Parliament in April, representing the views of the minority of the Royal Commission. Whereas both majority and minority would abolish the workhouse, the former would substitute a number of hospitals and asylums run by poor-law authorities, while the minority would turn these dependents over to the health, education or other authorities. The latter would avoid duplication of authorities performing the same func-

tions. The minority would reduce indoor care to a minimum; and for outdoor relief put children under the educational authorities, which now partially feed, clothe and give them medical attention; the aged under the pension, and the sick under the health authorities. These authorities would be given the responsibility also of searching out prospective destitution and preventing its full development; they could enforce treatment for industrial diseases, to be paid for by the beneficiary, if able. Both majority and minority would have the community assume full responsibility for the support of widows and their children under fifteen years of age. The minority would admit all old persons and wage-earning widows to the old-age pension lists. The educational and political campaign carried on by the National Committee in behalf of these proposals has been remarkably successful in enlisting popular support; this is a long step toward Parliamentary action.

*The International Congress of Public Relief and Private Philanthropy* held its fifth session at Copenhagen in August, under the presidency of ex-President Loubet of France. All European countries and the United States were represented by 400 registered delegates, those from France and Denmark being most numerous. Public officials predominated over the representatives of private charities. The plan of the Congress is to prepare several topics each to be reported on by persons from a great many countries. These individual reports are summarized and printed beforehand, the sessions being devoted mainly to debate. The topics in 1910 were: Sick Nursing in Country Districts; the Relief of Foreigners; Women's Participation in Public Charity; and Relief of Widows with Children. There was a special address on International Protection and the Rights of Destitute Children.

**CHARITY ORGANIZATION.** See CHARITY.

**CHARLTON, JOHN.** A Canadian publicist, died February 11, 1910. He was born in 1829. He was for 32 years a member of the Canadian Parliament. He consistently urged friendly relations between Canada and the United States, including free trade between the two countries. In 1898 he was a member of the Joint High Commission appointed to settle disputes and remove trade obstacles between Canada and the United States.

**CHARTER REFORMS.** See INITIATIVE AND REFERENDUM; MUNICIPAL GOVERNMENT.

**CHARTRES, Duc de.** See DE CHARTRES, ROBERT LOUIS PHILIPPE, DUC.

**CHARTS, ERRORS IN.** See EXPLOitation and TERRESTRIAL MAGNETISM.

**CHATTERTON, E. K.** See LITERATURE, ENGLISH AND AMERICAN, *History*.

**CHATTERTON, HEDGES EYRE.** An Irish jurist, died August 30, 1910. He was born at Cork in 1819 and educated at Trinity College, Dublin. He was admitted to the bar in 1843. He was appointed solicitor-general in 1866, attorney-general in 1867 and from the latter year to 1904 was Vice-Chancellor of Ireland. He made a great reputation in the State trials of 1867 when he conducted the indictment of the Fenian leader, Colonel Burke. He was one of the ablest advocates and special pleaders at the Irish bar of his day.

**CHAUFFEURS' LICENSES.** See AUTOMOBILES.

**CHAUTAUQUA INSTITUTION.** A system for the advancement of popular education, founded at Chautauqua, N. Y., in 1874 by John H. Vincent and Lewis Miller. The local work of the Institution is done in connection with a summer assembly in a series of summer schools. The year 1910 was notable on the programme side for the continuance of the usual general symposia, the chief topics of interest being "Health and Efficiency," "Contemporary Conditions in England," "The Christian Life" and "American Immigration." A new and brilliantly successful feature was an historical pageant in connection with the local history of the region and presenting certain scenes in Indian occupation leading up to the conquest of the French and culminating in the presentation of "The Little Father of the Wilderness" by Mr. Francis Wilson and a voluntary company of professional actors. The summer schools had the most prosperous year in their history and were strengthened by the successful inauguration of a rather extensive free scholarship system which in 1910 contributed in whole or in part to the expenses of nearly seventy public school teachers. To this end the investment of several thousands of dollars was made in rebuilding and remodelling and the generous contribution from friends of Chautauqua supplied the actual scholarship funds. Plans for considerable extension of this campaign are assured for the future.

**CHEMICAL SOCIETY, AMERICAN.** A scientific society founded in 1876. It had in 1910, 5100 members, including nearly all the prominent American and many foreign chemists. Annual meetings are held and the meeting of 1910 was held December 27-30 at Minneapolis. The Society met in six divisions and three sections as follows:—Divisions: Agricultural and Food Chemistry; Fertilizer Chemistry; Industrial Chemists and Chemical Engineers; Organic Chemistry; Pharmaceutical Chemistry; Physical and Inorganic Chemistry. Sections: Biological Chemistry; Chemical Education; and Chemistry of India Rubber. The Society publishes the *Journal of the American Chemical Society*, of which 32 volumes have been issued. It is published monthly. The officers for 1910 were: President, Wilder D. Bancroft, Cornell University; Secretary, Charles L. Parsons, New Hampshire College, Durham, N. H.; Treasurer, Albert P. Hallock, of New York City. See CHEMISTRY.

**CHEMISTRY. GENERAL PROGRESS.** In view of the great mass of chemical research published during the year, the present sketch can only be, as in previous years, extremely fragmentary. Nevertheless, it is believed that the few typical contributions selected will serve to give the non-specialized student a glimpse into the principal lines of work currently engaging the energies of the hosts of chemical investigators.

Debierré, the well-known discoverer of the radio-active element actinium, succeeded in deter-

mining the atomic weight of the radium emanation. Debierne's paper forms one of the most beautiful experimental contributions published in the course of the year. Since the emanation forms no chemical compounds, its atomic weight, like that of argon, could only be found by determining its density. Ordinarily, the determination of the density of a gas presents no particular difficulty, that is, when there is a considerable amount of the gas available. In the case of the emanation, however, the amount is exceedingly slight, and the difficulty of measuring its density is correspondingly great. All ordinary methods, involving determinations of both the volume and weight of gas, are entirely out of the question. Debierne made use of the method originally invented by Bunsen and not infrequently used for rapid measurements by industrial chemists in illuminating-gas works. The method consists in allowing the gas to escape from one chamber into another through a fine pinhole and measuring the rate of escape. The rate of escape informs us of the density of the gas, from which the molecular weight may be readily computed. In the case of the emanation, as in that of argon, helium, and the other monatomic gases, the atomic weight is simply equal to the molecular weight. But Bunsen's method, too, involves the employment of considerable amounts of gas, and Debierne's contribution consisted primarily in so modifying and refining Bunsen's method as to render it usable with very small amounts. Debierne finally succeeded in transferring one cubic millimetre of the emanation into one of the two chambers of his apparatus, closing it up under a pressure of only one one-hundredth of a millimetre of mercury, then establishing pinhole communication with the second chamber, in which the pressure was continually maintained with the aid of a rapid-acting mercury pump, as near zero as possible. The atomic weight of the radium emanation thus found was 220. According to theory, the atomic weight should be 222.5, that is, four units less than 226.5, which is the atomic weight of radium itself. Considering the great difficulty, experimentally, of the determination carried out by Debierne, the agreement between theory and experiment must be considered extremely satisfactory.

**ISOLATION OF RADIUM.** Another contribution published in course of the year by Debierne, together with Madame Curie, consisted in the isolation of radium itself, for the first time, in the metallic state. A solution of one-tenth of one gram of pure radium chloride was electrolyzed, with ten grams of metallic mercury as the cathode. The radium thus produced formed an amalgam with the mercury. The amalgam was transferred to a small iron boat, placed in a tube of quartz, and subjected to distillation, after the air had been completely pumped out of the tube. As the mercury distilled out, the temperature was allowed to rise higher and higher. The mercury was gone below 700° C., and pure radium remained behind. It formed a shining white residue in the boat, melted at 700° C., was rapidly altered by air, energetically attacked water, forming a soluble oxide of radium, and having altogether the radio-active properties that it was expected to possess.

**DIRECT DETERMINATIONS OF OSMOTIC PRESSURE** were continued during the year in several laboratories. To recapitulate briefly the main facts

connected with this subject, it has been known for many years that if membranes through which water alone can pass, but which are impermeable to substances that may be dissolved in the water—if such membranes are interposed between some solution on the one hand and pure water on the other hand, the pure water will pass through the membrane into the solution and render the latter more and more dilute. The force which thus drives the water into the solution has been named "osmotic pressure." A membrane like the one just described is called a "semi-permeable membrane." Many animal and plant membranes are semi-permeable, whence the important role played by osmotic phenomena in life processes. About forty-five years ago Traube found that an artificial semi-permeable membrane could be made from copper ferrocyanide. Measurements of osmotic pressure were first carried out by Pfeffer in 1877. About ten years later van't Hoff discovered the relationships of osmotic pressure and described them in a remarkable paper, which constitutes one of his chief titles to fame. The van't Hoff theory permits of calculating the osmotic pressure corresponding to a solution of given strength. It further shows that osmotic pressure depends only upon the nature and concentration of the dissolved substance, but is independent of the membrane that happens to be employed: with an ordinary membrane of copper ferrocyanide one ought, according to the theory, to find exactly the same osmotic pressure as by using a membrane made, for instance, of hog's bladder. The finest experimental work in connection with this theory has been carried on for a number of years by Professor Morse and his students at Johns Hopkins University, and the results are in excellent agreement with the van't Hoff theory. Another investigation, which has likewise lasted now for several years and is not yet completed, has been carried on at the University of Wisconsin by Professor Kahlenberg and his students. Instead of using water as a solvent, as did Pfeffer, and as Morse is still doing, the Wisconsin experimenters used pyridine, and in this they dissolved such substances as common sugar, as well as inorganic salts. Their semi-permeable membrane was made of rubber. Working under these conditions about five years ago, Kahlenberg found an osmotic pressure very much smaller than the one required by the van't Hoff theory. In fact, the observed osmotic pressure was only a small fraction of the theoretical. From this Kahlenberg boldly drew the conclusion that the celebrated van't Hoff theory is all wrong, or nearly so, that osmotic pressure is not proportional to the concentration of the dissolved substances, and that it does depend upon the nature of the membrane employed. In the summer of 1910 appeared a paper by Wilcox, a student of Professor Kahlenberg's describing a new series of experiments carried out, apparently, with great care. Wilcox's measurements seem to corroborate Kahlenberg's older work: Wilcox, too, found pressures that were but insignificant fractions of what he should have found in accordance with the van't Hoff theory. Considering this whole matter without any preconceived ideas in mind whatever, one would have at least to doubt from now on the validity of the van't Hoff theory; one would be almost inclined to reject it outright. If, however, one investigates the theory with due care, one finds that

it is based on practically nothing else than the law of the conservation of energy. The acceptance of the experimental data of Kahlenberg and his associates involves not merely rejection of a theory of the flow of water through membranes, with which one might dispense with no more than a sigh, but a veritable revolution in physics and chemistry, the rejection of the broadest and most fundamental principle of science—the law of the conservation of energy. With preconceived ideas of this nature in mind, one cannot help siding with the van't Hoff theory and against the Kahlenberg facts until many more years of the most painstaking experimentation might demonstrate that the Kahlenberg observations are really faultless truth.

**ULTRA-VIOLET LIGHT.** To turn to another subject of research, recent years have been gradually bringing into prominence investigation of the chemical and physico-chemical effects of ultra-violet light. As time goes on, these effects will undoubtedly form an important chapter of chemical science. By way of an example of contributions along this line may be mentioned a paper by Svedberg. With the aid of ultra-violet rays from a quartz mercury lamp, Svedberg succeeded in producing colloidal solutions of metals. The surface of the metals is simply cleaned free from oxide and covered with a solvent. A few minutes' exposure suffices to produce the desired effect in the case of lead, tin, copper and silver, and in such liquids as water, alcohol, acetone, and other organic solvents.

Another series of experiments on the *chemical effects of ultra-violet light* was carried out by Thiele at the technological institute of Dresden, Germany. The following are a few of the results: First, the combination of hydrogen and oxygen was investigated at the ordinary temperature. Ordinarily, the two gases refuse to combine with any appreciable velocity unless they are heated. When perfectly dry, they refuse to combine even at high temperatures. The presence of a trace of moisture greatly catalyzes, that is, hastens the reaction. When, however, a mixture of the two elements is exposed at the ordinary temperature to the action of ultra-violet light, the two combine readily into water. Curiously enough, under these circumstances the presence of moisture does not hasten, but slows up the reaction. Evidently, the mechanism of the reaction in the presence and in the absence of ultra-violet light is entirely different. Another case investigated by Thiele was the action of oxygen upon hydrochloric acid. In the absence of ultra-violet light no action can be detected unless an appropriate chemical catalyzer is added. In the presence of ultra-violet light the hydrochloric acid is rapidly oxidized to water and free chlorine. Similarly, aqueous hydrobromic acid exposed to ultra-violet light in the presence of air rapidly turns brown, owing to separation of free bromine. Hydrogen peroxide is decomposed by ultra-violet light with great rapidity. When a solution of the white of a hen's egg was exposed to ultra-violet light, it soon turned yellow and began to smell like scorched nitrogenous matter. The extent of the importance of such researches will be clear if one bears in mind the great rôle played in the economy of nature by the chemical action of sunlight, which contains, of course, a considerable proportion of ultra-violet rays.

The possibility of applying ultra-violet light to immediate use is pointed out by a communication made to the French Academy by Victor Henri and two collaborators, Helbronner and Recklinghausen. Henri has for some time been studying the action of ultra-violet light upon various micro-organisms. The action appeared to be in almost all cases a powerfully destructive one and so the possibility suggested itself of utilizing ultra-violet light for the purification of water on a large scale. The experiments published in the course of the year by the three French investigators were altogether promising. Water containing large numbers of germs and colon bacilli (between 30 and 800 germs per cubic centimetre and from 50 to 100 colon bacilli per litre) was roughly filtered for the purpose of rendering it clearer and hence more accessible to the action of light; then it was caused to circulate through a special apparatus in which it was exposed to the light from a Cooper-Hewitt mercury lamp of quartz. The water was allowed to run rapidly, 25,000 litres passing through the apparatus per hour. The emerging water was absolutely free from colon bacilli and practically free from germs.

**STEREO-CHEMISTRY.** An interesting contribution to stereo-chemistry was published by Perkin, Pope, and Wallach. Organic stereo-chemistry was originally founded by van't Hoff upon the doctrine of the asymmetric carbon atom. An "asymmetric" carbon atom is defined as a carbon atom linked to four other atoms, or four groups of atoms, different from one another. According to stereo-chemical theory, a compound containing one or more asymmetric carbon atoms must rotate the plane of polarized light, and conversely, every compound that rotates the plane of polarized light must be expected to contain one or more asymmetric carbon atoms. It has been realized for some time that this principle is not strictly true, that the necessary and sufficient condition for the optical activity of a compound is that its molecule, considered as a geometrical body, shall be unsymmetrical, and that the presence of an asymmetric carbon atom, while generally an indication of molecular asymmetry, is not a necessary condition of it. Experimentally, however, no clearly defined case was known of a compound rotating the plane of polarized light and yet having an asymmetric carbon atom in its molecular. During the year, Perkin, Pope, and Wallach succeeded in preparing such a compound—a contribution which was greeted with pleasure by all those interested in the working of the atomic and molecular theory. The compound in question is termed, in the more recent system of nomenclature, 1-methyl-cyclohexylidene-4-acetic acid. In the older nomenclature, which may be more intelligible to some people, it might be called paramethyl-pentahydro-phenyl-acetic acid. Its formula is  $\text{C}_8\text{H}_{12}$ :  $\text{CHCO}_2\text{H}$ . As first prepared from optically inactive compounds, the substance was, of course, optically inactive. With the aid, however, of the hydrochloride of the alkaloid brucine, the investigators succeeded in breaking up the substance into two components of equal and opposite rotation. In their paper they justly call attention to the fact that the new compound furnishes independent proof of the high reliability of the structural formulæ of organic chemistry as atomic pictures of the compounds represented by them.

Another line of research, of no small import-

ance to organic stereo-chemistry, but unfortunately fruitless as yet, has consisted in attempts to prepare substances rotating the plane of polarized light from optically inactive materials with the aid of circularly polarized light. The problem is a fascinating one in itself and has, besides, important biological bearings. Just as in biology it is now accepted as a general principle that there is no such thing as spontaneous generation, that all life comes from other life that has existed before it, so it is accepted as a fundamental principle of stereo-chemistry that an optically active substance can only be derived from another optically active substance or, as it may be stated, that the spontaneous generation of optically active substances is an impossibility. Now, the body of all animals and plants, chemically considered, is full of optically active substances. For instance, the various sugars, starches, celluloses, and albumens are all optically active. While, then, the biologist is asking how the first life originated on our planet, the chemist raises the parallel question as to how the first optically active substance had come into existence. The only hypothesis that the biologist has as yet been able to advance in answer to his question is that the first life germs have come here from other worlds. In answer to the parallel chemical question, it has been suggested that an optically active substance may be formed from an inactive material under the influence of circularly polarized light, that is, ordinary light all of whose rectilinear vibrations have been changed into circular vibrations, with the circular motion being, furthermore, all in the same direction. Such light has been known to appear at times in nature, hence, if the chemists should succeed in artificially producing an optically active substance by means of such light, the mystery of the origin of active substances on earth would disappear. No wonder that in spite of repeated failures new attempts are made every year in this direction. During the year, Padua, working at the University of Bologna, in Italy, examined the *a priori* promising case of the action of bromine upon angelic acid. The latter substance is itself optically inactive. The dibromotiglic acid resulting from the action of bromine upon angelic acid would undoubtedly rotate the plane of polarized light if it were produced in the body of some animal or plant. But when Padoa prepared it artificially in a stream of circularly polarized light, it was absolutely inactive, one might say "optically dead": one more unsuccessful attempt.

**COLOR OF DYE STUFFS.** A problem of very great importance in organic chemistry is to ascertain the cause of color of dye stuffs. To the chemist this problem means, to ascertain just what composition and molecular structure are necessary and sufficient to produce color. From a practical view-point, this problem solved, the chemist could produce innumerable dyestuffs as yet undreamt of, possessing perhaps any desired hue or shade, and including many of high industrial value. From a purely scientific view-point the solution of such a problem, interesting as it is in itself, may quite possibly lead to the unveiling of altogether new treasures of knowledge, as yet completely hidden from view. For did not the hunting up of a peculiar photographic property of pitchblende by Monsieur and Madame Curie lead to the creation of one of the most marvelous branches of human knowl-

edge? To return to the question of the color of dyestuffs, a theory which was widely accepted for a number of years was Witt's so-called "chromophore theory." According to this, color is caused by the presence of "chromophores," that is, of certain atomic groups, such as the carbonyl, nitro, nitroso, and azo groups, and especially of double bonds. Another theory in vogue is the quinone theory, which considers a quinone-like union of atoms essential for color production. Both of these theories have been of the greatest value in the synthesis of dyestuffs but neither can be said to define clearly the actual cause of color, and recent investigations have shown both to be decidedly insufficient. So we find in the current literature of chemical research a considerable number of contributions attempting to develop a more adequate theory. In the front rank of workers along this line we find Professor Hantzsch and his students, at the University of Leipzig. Hantzsch believes that color is due, not to the presence of some chromophore group of atoms, but to the presence of a pair of groups of no great chemical stability, with a hydrogen atom capable of migrating from one to the other and back, and thus changing the composition and structure of either group. Since the chemical change thus involved consists only in a rearrangement of atoms, unaccompanied by a change in the composition of the substance as a whole, the two resulting substances are obviously isomeric. Furthermore, since the change is readily reversible, the substance may be considered as "tautomeric." Of this tautomeric pair, one substance is colorless, the other is colored, and either readily passes into the other. Plainly, Hantzsch's theory contains in it no essentially new concept: it is merely a modification, a refinement of Witt's chromophore theory. But this does not make it less valuable. Hantzsch calls the colorless substance and colored isomer "chromo-isomers"; their mutual transformation or, more precisely, the transformation of the colorless into the colored form he terms "chromotropy." A direct confirmation of Hantzsch's theory was obtained by Hantzsch and Gorke in the case of ortho-nitro-phenol: this substance yields a methyl derivative (ester) that is colored. What is the cause of the color? According to Witt's theory, the color is due to the presence of the nitro-group. According to Hantzsch, theoretically, there ought to be two tautomeric methyl derivatives—one colored, the other colorless. As a matter of fact, Hantzsch and Gorke succeeded in actually isolating two methyl esters of ortho-nitro-phenol, one colorless and the other red. Following in Hantzsch's steps, Willstätter also discovered a pair of tautomeric ortho-benzo-quinones, of which one is colorless and comparatively unstable, the other is colored and stable. In certain cases both chromo-isomers may be colored. A mixture of the two in different proportions ought then to yield substances of all possible shades of color, varying from the pure color of the one isomer to that of the other. In accordance with this inference from Hantzsch's theory, certain alpha-oximino-ketones, such as di-methyl and di-phenyl violuric acids, are capable of yielding salts of every imaginable color. To this phenomenon Hantzsch applied the name "pantochromism." The relative proportions of the two chromo-isomers co-existing and holding balance to each other must

be expected to vary from solvent to solvent. As a matter of fact, Hantzsch's pantochromic salts yield differently colored solutions in different solvents. This fact might be accounted for on two different principles: first, it might be due, in accordance with Hantzsch's theory, to different arrangements of the atoms within the separate molecules, the outward difference resulting from different proportions of the two kinds of molecules present, but, on the other hand, it might also possibly be due to different combinations of molecules of one and the same kind among themselves. In other words, according to Hantzsch's assumption, the cause is intra-molecular; according to the alternative assumption, the cause is extra-molecular or, more precisely, inter-molecular. To decide between the two possible explanations, Hantzsch undertook to investigate experimentally, whether there are at all any poly-molecular complexes in solutions of pantochromic salts. The result was decidedly negative: these solutions contained nothing but simple molecules, and hence the cause of their different appearances can only lie within the molecules themselves. In conclusion, it may be stated that this work of Hantzsch's, together with a variety of observations published by Thiele, Baeyer, Stieglitz, Acree, and others, has in very recent years all but disproved the celebrated Ostwald theory of indicators, which was widely and confidently taught but a short time ago, and in accordance with which the color, for instance, of phenol-phthalein in alkaline solution is due to the phenol-phthalein ion being red, while the undissociated substance happens to be nearly colorless.

No account of recent work on the connection between the color and constitution of organic substances would be complete without at least some mention of the views and contributions of Baly, Stewart, and Desch. Investigators of this school go a step further than those of Hantzsch's. They believe that color is due, not to some chromotropic isomer of a substance containing a chromophore group, but to the chemical action involved in the incessant mutual transformation of the two isomers. Such transformation may involve, as already indicated above, the migration of a hydrogen atom from one group to the other and back, constituting the phenomenon of tautomerism proper. In certain cases, however, it may only involve the oscillation of a valency, in which cases Baly would call the phenomenon "isorropesia." Examples of such cases are presented by di-acetyl and by quinone itself. Now, whether a given case be one of true tautomerism, or one of isorropesia, color, according to the Baly-Stewart school, is due to the rapid oscillatory motions going on within the molecule and immediately causing the absorption of light of certain wave-lengths. Any attempt at a critical estimate of the relative merit of the views of the different schools would be out of place in a brief account, especially in the present raw and unfinished state of the investigations. It must, however, be said that the views of the English school seem to possess an unusually promising penetration and illuminating power.

Among the contributions published during the year must, finally, be mentioned a series of papers presented in September, 1909, at the 20th Anniversary Celebration of Clark University in Worcester, Mass., by a number of leading American investigators. Practically all

American chemical research laboratories were represented at the Clark conference, and each investigator presented a summary of his researches. The papers were gradually published in the course of 1910 in the *Journal of the American Chemical Society*. The complete set will also appear in the form of a separate Celebration volume early in 1911 and will form a first-hand history of the chemical research carried on in America in our own days. Looking over the splendid material of this volume, one cannot help feeling the truth of Ostwald's prophecy, that the centre of gravity of science is bound to move from Europe across the Atlantic and introduce a new and remarkable era in American history. See ATOMIC WEIGHTS.

**CHEMISTRY, INDUSTRIAL.** The progress in the development of industrial chemistry persists with unabating zeal, and the records of recent years are fully equalled by that of 1910. In two important subjects has there been considerable activity. Improved methods for the extraction of radium, affording greater opportunities for the use of this element; and the synthesis of rubber, the natural sources of which seem inadequate to the demand, are the important features of the progress of the year.

**ORGANIZATION.** The American Chemical Society, now the largest Chemical Society in the world with a membership of over 5100, held two general meetings during the year. The first was in San Francisco, Cal., during July 12-15, and the second in Minneapolis, Minn., during December 28-31. Its president is Wilder D. Bancroft, of Cornell University. The Perkin medal was given to E. G. Acheson of Niagara Falls in recognition of his invention of carborundum, siloxicon, etc. A Willard Gibbs gold medal has been established by William A. Converse for the best paper or address presented before the Chicago section, and is to be awarded annually. The American Institute of Chemical Engineers held two meetings during the year, one at Niagara Falls, Ontario, during June 22-24, and the other, the annual meeting, in New York City during December 7-10. Its president is Charles F. McKenna. On the retirement of Prof. Charles F. Chandler from the chair of chemistry in Columbia University his students presented to the trustees of the University in his honor a fund to be known as "The Charles F. Chandler Foundation," the interest of which is to be devoted each year to defraying the expenses of one or more great public lectures on chemistry or some of its applications. The 29th annual meeting of the Society of Chemical Industry of Great Britain was held in Glasgow on July 6-8. On this occasion the Society's medal was presented to Thomas Tyrer for his services to industrial chemistry.

**METALS.** The decay of tin hitherto observed is now further described as "catching." A consignment of tin sent from Rotterdam to Moscow in 1877 arrived at the latter place in the form of powder. This alteration is said to be due to a change in the internal crystalline structure of the metal, and may be described as analogous to the slow transformation of monoclinic sulphur to rhombic sulphur. This seems to explain why articles of tin of archeological interest are so seldom found. Cohen described a rare form of tin disease which may be called "strain disease" and which may be caused by shocks, compression, or any strain to which the metal may be subjected. Conversion into this state is ac-

celerated by contact with metal that is already in this condition, while melting reconverts it into the normal state.

Among the newer uses to which aluminum is being put is its adoption for minor coins. This has been frequently recommended in the past, but it has remained for France actually to replace the bronze 25, 10 and 5 centimes pieces with new coins made of aluminum. In discussing the use of this metal for coinage, the French authorities took into consideration the cost, malleability, weight, and durability of the white metal and agreed that aluminum fulfilled the requirements most satisfactorily.

Newer uses for other metals are constantly being found. Tantalum is now being employed in the manufacture of dental instruments, and it is reported from Germany that not only are such instruments cheaper, but they do not rust when exposed to the air, also they retain their polished surfaces longer and are more lasting than steel instruments. The monazite sands from Brazil and from South Carolina are now sent to Germany where they are largely used to manufacture thorium nitrate, a substance employed in the making of incandescent gas mantles. Tungsten ores from Spain are meeting with greater demand, and deposits of wolframite that had been abandoned are now being worked again. The output goes to Germany where the ores are smelted and the metal finds use for making high speed tool steel, also for motor cars, and in the manufacture of electric lamps. The supply of the mines in Argentina is also shipped to Germany. The demand for tungsten for incandescent lamps has resulted in the production of ductile tungsten which is described as a bright, tough, steel-colored metal which can be drawn into the finest wire, much below 0.001 inch. The tensile strength of the wire increases as the drawing proceeds, that is the more the metal is mechanically worked the tougher it gets. Similar results have been obtained with molybdenum, a metal for which, however, the commercial demand has thus far been but slight.

**IRON AND STEEL.** It is reported from Pittsburgh that in the mills at Homestead by a process recently discovered the ore dust is to be made into briquettes and utilized in making pig iron. It is claimed its use will effect a reduction in the cost of pig iron. The dust, under the tremendous pressure of the blast, is caught at the top of the furnace, and then carried to the base of the stack, to be carted away. The demolition of a "skyscraper" in New York City during the summer months led to the critical examination by an expert of the condition of the steel. He found the steel generally to be in a good state of preservation, although some rivets were corroded. The paint used to "preserve" the steel, made of pure linseed oil, had entirely disappeared, owing to chemical action with the mortar. The main feature of the preservation of the steel was the fact that the columns were encased in brick and a rich mortar or grout came in contact with the metal. Wherever there was insufficient contact between the grout and the steel, rust formed; but as the construction of the building was such that moisture was very largely excluded, there were only two or three instances where bad rust pitting took place. The great lesson to be learned from the examination of this steel is the fact that cement mortar one inch thick around a column

of steel is the best preservative. Linseed-oil paint should not be used, for there are alkali-proof paints which at the same time electrically insulate and serve a better purpose. A non-rusting iron called "ingot iron" is now a commercial product. It is described as an iron made as nearly pure as possible. Chemical analysis shows it to contain sulphur, 0.005 per cent., phosphorus, 0.005 per cent., carbon, 0.021 per cent., and manganese and silicon, a trace. It is recommended for use in ground where it may be attacked by dampness, in localities where it becomes the intermittent conductor of electrical currents, at the seashore where it is attacked by salt air, or in cities where the atmosphere is impregnated by fumes of gas and coal smoke. A new rust-proofing process for iron and steel is announced in England. The article is boiled in 1 gallon of water to which is added 4 ounces of phosphoric acid, and 1 ounce of iron filings. A black non-corroding coating is produced.

**ALLOYS.** Among the new alloys reported is one to which the name "Clarus" is given. It is made commercially in Birmingham, England. Clarus is made of aluminum and it is claimed for it that it is at least 60 per cent. stronger than ordinary aluminum and that its weight is one-third that of brass; that it will take a very high polish, equal to that which can be obtained with silver; that atmospheric surroundings do not cause it to tarnish; that castings are not brittle, but can be bent cold; that it is suitable for castings of any size, and that in all circumstances such castings have been found to be sound and free from blowholes and other defects. The new alloy is said to be suited for automobiles and for electric railroad, railroad car, and aeroplane fittings. Also from Birmingham is "Duralium," which is said to be slightly heavier than aluminum and as strong as steel, so that it can be rolled, drawn, stamped, extended, or forged at suitable temperatures; and it is less corrosive than other high aluminum alloys under the usual corrosion tests. It is expected that duralium will find a demand for aviation uses, and in the construction of motor cars, owing to the difficulty of securing aluminum castings sufficiently reliable not to break under the strain of sudden jars and shocks caused by quick stoppages, changes of speed, and jolts upon bad roads.

From Germany comes "Ruebel bronze," an alloy, the main ingredient of which is magnesium. This metal in its pure state is unfit for metallurgical purposes, as it is soft and susceptible to atmospheric and chemical influences. Magnesium loses these properties if only small quantities of other metals are added to it. Zinc, copper, and aluminum are added in this new invention in varying quantities, resulting in a fine-grained, homogeneous alloy of considerable strength and low specific gravity. This new alloy is of importance in constructing air ships.

The alloy of cobalt and chromium, called "stellite" by its inventor, has been described as of value for cutting purposes. Blades made from the alloy take a fine cutting edge, which is particularly smooth, though capable of excellent cutting qualities. A razor made of the cast material had been employed for nearly two years, and had been used for shaving purposes hundreds of times without showing any signs of wear. A lathe tool made from stellite, with

certain modifications, is capable of cutting ordinary steel at a very high rate of speed. A test was made against high-speed steel, and it was found that the stellite tool would cut a continuous shaving from the bar at the speed of 200 feet a minute, while the high-speed alloy steel tools failed almost instantly.

**RADIUM.** Much interest has been manifested in the exploitation of this rare element during the year. The institute founded in Vienna, Austria, was formally opened in November when its director, Prof. Franz Exner, announced that it would be entirely devoted to research into the physical and chemical properties of radium. The problems that will be studied first are the establishment of a standard for the content of radium in radioactive substances, an exact determination of the atomic weight of radium, and the examination of mineral waters and rocks believed to contain radium.

The Austrian government has established a sanatorium with hotel and bathing accommodations in Joachimsthal, Bohemia, where the water of the river Tepi is believed to be strongly impregnated with radium. These waters have been reported as affording relief in cases of rheumatism, uric acid poisoning, nervousness, neuralgia, and old exudations of various kinds.

In England the British Radium Institute, founded in 1909 for the purpose of loaning that precious element to scientists and physicians, had made for it a safe for the storage and protection of radium. This was constructed of lead, which is said to be the only element capable of withstanding the great penetrating power of the radium emanations, and in order to prevent the escape of these emanations when the door is opened, two valves have been fixed in it through which tubes of mercury will be passed to collect and retain any escaping emanations. The cost of radium according to Sir William Ramsey is now \$2,100,000 an ounce, which is considerably less than the amount (\$3,000,000) reported last January. This reduction in price is attributed to the discovery of larger deposits of pitchblende containing radium in Cornwall, England, and the establishment of a factory in Limehouse, London, where by an improved process commercial radium is obtained in two months as compared with a year required by the methods used in Joachimsthal. It is claimed that before long England will be the chief producer of radium. It is estimated that the total stock of radium now in the world is about four ounces.

The usual commercial product known as radium is in reality one of its salts, usually the bromide. By following the process used in 1807 by Sir Humphrey Davy for the reduction of the alkaline elements, Madame Curie and E. Debiere announced in September, 1910, that they had isolated pure radium. They prepared an amalgam of mercury by the electrolysis of a radium salt. This amalgam was placed in a quartz tube and distilled by hydrogen under pressure and high temperature. The mercury was then found to have left a thin coating of a brilliant white metal which proved to be radium. The metal acts with great energy; it decomposes water, oxidizes rapidly in air, is attracted by iron as though by some magnetic property, and burns paper when placed in contact with it. Announcement was made earlier in the year of the isolation of polonium by Madame Curie, who found that it had a radioactivity superior

to radium, although radium conserves its energy for an indefinite period while that of polonium disappears rapidly.

**SYNTHETIC SAPPHIRES.** In 1910 announcement was made of the discovery of synthetic sapphires. Synthetic rubies, that is crystallized aluminum oxide colored red, were first announced in 1893 but other colors seemed to resist all efforts for their production. A. Verneuil has successfully overcome the difficulty and it is said that the new sapphires surpass the synthetic rubies in excellence. To ordinary tests no difference is apparent between the natural sapphire and the synthetic variety, only to the expert with a microscope are minute differences detectible.

A desposit of peridots has recently been discovered in Alexandria, Egypt. These stones, which are amber in color, for many years have been found in large quantities in Upper Egypt, but never before in this section of the country. The finder has uncovered several thousand of them at a depth not greater than ten feet. It is believed that the peridots were buried in the foundations of houses of the ancient Egyptians and in tombs as an omen of luck. The stones now found are estimated to have been buried for over 1500 years.

**PAPER AND FIBRE.** The search for materials from which paper can be made continues. An appropriation of \$30,000 was given by Congress to the Secretary of Agriculture for the purpose of testing such plants and woods as may require tests, to ascertain if they will be suitable for making paper. A project has been started for the manufacture of paper from Australian timber. The blue-gum wood from that country has been tested in the paper mills of Great Britain, and the result was a product said to be equal to paper made from the African esparto grass. The intention is to make better-class paper, and for this the blue gum is particularly suitable. A factory will be erected in Tasmania, and as there is an enormous supply of blue gum all through Australia there is every prospect for the successful outcome of the proposition.

The fibre of the sea plant has been identified as *Posidonia australis*. Later reports show that this fibre, cleaned and dried, possesses many valuable properties. It is not inflammable, except at a very high temperature, and for this reason has a distinct advantage over flock, kapok, oakum, etc. For bedding and upholstering purposes it has been found to have the lightness and softness of flock, while its purity and the utter absence of animal life give it great sanitary value. A mixture of this fibre with wool appears to weave into an excellent cloth, which may be dyed various colors. Other purposes for which the fibre seems adaptable are rope, string, twine, mats, linoleum, army blankets, paper; for packing fruit, eggs, etc., for export, calking decks and woodwork of ships, stuffing saddles, insulating doors to cool chambers, and packing around submarine cables.

**ARTIFICIAL CAMPHOR.** Synthetic camphor, which is one of the recent triumphs of chemistry, has had a curious experience. During the Russo-Japanese War, when the exporting of Japanese products became difficult, the price of camphor increased so that the artificial product could be manufactured profitably, and at the close of the war the Japanese hastened to take advantage of the high price and in many cases exhausted their plantations. Consequently the price fell, and at present synthetic camphor can

not compete against natural camphor; moreover as the principal demand for camphor was for the manufacture of celluloid, and as other products, especially those that are not explosive, are taking its place, the future of camphor, either natural or synthetic, is dubious. Artificial camphor is made from essential oils derived from turpentine. Chemically the only difference between turpentine and camphor is the possession by each molecule of the latter of one atom of oxygen which is lacking in the former. By chemical processes the needed oxygen is supplied. Three-fourths of the entire supply of camphor is used in the arts, chiefly in the celluloid industry, and one-fourth in medicine.

**ARTIFICIAL RUBBER.** The shortage in the world's supply and the steadily growing consumption of rubber, especially in construction of automobiles and air ships, has created so great a demand for it that prices have materially increased. To meet this demand inventors have striven to obtain a satisfactory substitute. The problem has been attacked from three points of views, as follows: actual substitutes, containing no rubber; composite rubber, in which some natural rubber is worked up with other substances; and true synthetic rubber. In the first of these the most successful results have been obtained thus far, and they consist for the most part of some oxidized, sulphured, or nitrated oil worked up with other ingredients into a solid with some elastic properties. Other substitutes are mixtures, such as bakelite (see YEAR BOOK, 1909, p153), a condensation product of formaldehyde and phenol, and they are many. The composite rubbers are compounds of rubber and such ingredients as tend to make them acceptable for some special purpose. A true synthetic rubber is the result which has attracted the attention of many chemists in recent years. It had been found that some distillation products of caoutchouc changed into rubber when treated with hydrochloric acid, consequently the study of products of the destructive distillation of rubber and similar substances has been followed. In 1882 Sir William Tilden found that isoprene could be obtained from terpenes (from oil of turpentine), and this isoprene in turn underwent a polymerization into rubber. This proposition has been denied by some chemists, but in April the directors of the Farbenfabriken-Bayer Company of Elberfeld announced that their chemists had successfully synthesized India rubber though they were not ready to undertake its commercial production. This process is said to start with oil of turpentine, from which isoprene is obtained, and the product is then treated with acetic acid which transforms caoutchouc into a soluble compound. This successful synthesis is a splendid tribute to the persistence and ability of German chemists.

**MISCELLANEOUS.** A process for the manufacture of alcohol from the waste of paper mills is reported from Sweden, where a company is now making ethyl alcohol from the residues of the sulphite. This will enable the refuse of paper mills to be utilized and the sulphite waste, heretofore thrown away and which polluted streams, can be turned into a valuable by-product.

**FERTILIZER FROM MORTAR.** From Norway comes the information that the mortar obtained from purifying sugar liquid, and which was formerly difficult to dispose of, has recently been experimentally made into fertilizer. To the mortar is added slacked lime, and by

a mixture of carbon dioxide there is secured a sediment saturated with potassium carbonate which by precipitation absorbs other organic compounds of the liquid in connection with phosphoric acid. The deposit or lime mixture is separated by filtering.

**PERMUTIT FILTERING.** A process for rendering hard water completely soft and of preventing boiler incrustations that is effective and inexpensive has been put into practical use in Germany. It consists in a rapid filtering of the water through a composition named "permutit," by which the calcium or lime, manganese, iron, and magnesium compounds, which render the water hard, as well as the microbes it may contain, are, it is claimed, wholly removed, a result hitherto unattainable outside of the laboratory of the chemist. When desired the compounding of the permutit may be such as to leave either the lime or magnesium in the water. It is also said that by permutit filtering gold can be obtained quantitatively from solutions as thin as sea water, containing 0.006 gram to the ton. Furthermore, the water filtered through permutit when used in boilers will leave no incrustations. Another important economy which is claimed for this system is the saving of fuel, the completely softened water requiring much less coal to convert it into steam than is required by hard water.

**PRESERVING WOOD.** A new method of preserving wood that has been invented and successfully employed in Australia, consists in boiling the wood and allowing it to cool and absorb a saccharine solution, after which it is dried, rendering the wood thoroughly seasoned within a few days after cutting, increasing its strength, and stopping all warping and shrinking. The sap in the wood is driven out and replaced by an antiseptic, owing to the saccharine solution boiling at a higher temperature than water, thus making the wood impervious to dry rot and to the attacks of white ants and other parasites which prey on ordinary lumber.

**RESINITE.** Resinite is a new substitute for celluloid that has been invented in Germany. It is produced in a variety of modifications by the union of formaldehyde and carboic acid in connection with certain metallic salts. This special variety is used chiefly with porous materials, such as wood, paper, pasteboard, etc., and renders them hard and impermeable. Thus ordinary pine wood, when thoroughly impregnated, becomes so hard that it rapidly dulls a planer. In another form it can be poured as a liquid into molds. After coagulation it is transparent, with ruby tint, infusible, and unaffected by ordinary chemical reagents. It is well adapted for making ornaments, such as hat-pin heads, imitation jewelry, and for most purposes where enamel or enamel varnish is employed. For doorplates, street numbers, signs, etc., it seems capable of rendering excellent service, being entirely unaffected by atmospheric action. A third modification is liquid, but upon the addition of a mineral acid, it quickly solidifies to an elastic, homogeneous substance, which can be easily cut, turned, polished, etc. In this form resinite can replace, for a multitude of purposes, horn, celluloid, vegetable ivory, and similar substances.

A smoke consumer and fuel economizer invented in Rotherham, England, is described as follows: Coal was fed into the furnace of a boiler generating steam for running the works,

with the usual emission of black smoke from the chimney; then the "consumer" was put into operation and there was only a slight trace of the products of combustion. The change is effected by an arrangement of a series of devices so placed in the flues as to intercept the smoke and cause it to be ignited by the flames of the fire. Two air circulators are so placed as to allow the desired quantity of external air to be circulated among these devices, causing the smoke to be properly ignited and consumed around the boiler flues before entering the chimney.

**CHESS.** The principal happening in chess circles during the year 1910 was the world's championship match between Dr. Emanuel Lasker, the title-holder, and Carl Schlechter of Vienna. Lasker for the first time in his career narrowly escaped defeat. He succeeded only in tying Schlechter's score by winning the tenth and last game. Schlechter won the fifth game. All of the rest were drawn. The match took place at Vienna and Berlin. In a subsequent series at Paris Lasker defeated D. Janowski by a score of 7 to 1. Two games were drawn. Frank J. Marshall, champion of the United States, defeated J. W. Showalter of Georgetown, Ky., in a match held at Lexington, and also won the championship of the Manhattan Chess Club. At the International Congress held in Hamburg, Germany, won by Schlechter, Marshall tied with Teichmann for fifth place. The Anglo-American cable match resulted in a victory for the British team, which won  $6\frac{1}{2}$  games and lost  $3\frac{1}{2}$ . Sir George Newnes, the donor of the trophy contended for, died during the year. The Intercollegiate cable match was won by the American team, the score being  $4\frac{1}{2}$  to  $1\frac{1}{2}$ . The eighteenth intercollegiate tournament ended in a tie between Harvard and Yale. Columbia finished third and Princeton last. Pennsylvania again was victor in the Triangular Chess League tournament, Cornell winning second place. The Interstate College League, consisting of New York University, College of the City of New York and Stevens Institute, played its first series of games, New York University easily carrying off the laurels.

**CHICAGO UNIVERSITY.** An institution of higher learning at Chicago, Ill., founded in 1891 by John D. Rockefeller. The total number of students in 1910 was 6007 compared with 5659 in 1909. This number includes all

individuals registered throughout the year, including the summer quarter. In order to make the figures comparable with other institutions, they should be reduced to a basis in which the unit is one individual in residence nine months. The faculty numbered 280 in 1910, including about 60 assistants. In the library there are about 500,000 volumes. The most important event in the history of the University during the year was the action of Mr. Rockefeller in December in setting aside from the funds of the General Education Board \$10,000,000 to be paid in ten annual installments to the University with the request that \$1,500,000 be used for a chapel and the remainder for other purposes than endowment. This increase of Mr. Rockefeller's gifts during the twenty-one years of the existence of the University to \$35,000,000 was stated to be his final contribution, and was accompanied by the withdrawal of his personal representatives from the Board of Trustees. Mr. Rockefeller has, therefore, no further official connection with the University.

George E. Vincent, Dean of the faculties of Art, Science, and Literature, was elected in 1910 to succeed President Cyrus Northrop of the University of Minnesota, who had resigned.

The University conducts evening and Saturday courses, and correspondence study. It conducts also an academy for boys and has close affiliation with thirteen other college institutions, academies and seminaries, and official co-operation with some 200 high schools in eighteen States. The University press publishes many volumes yearly and issues fourteen publications. The receipts from benefactions during the year, exclusive of the gift of Mr. Rockefeller noted above, amounted to \$1,194,325. The total productive funds of the University amounted to \$14,902,070 and the total income to \$1,612,336. The President in Harry Judson Pratt.

**CHILD LABOR. THE REFORM MOVEMENT, MEETINGS AND PROGRAMMES.** The sixth annual conference on child labor was held at Boston, January 13-16, under the auspices of the National Child Labor Committee. The general topic of discussion was child-employing industries, especial attention being given to textile and home industries, street trades, canneries and agricultural work. Special sections of the conference were devoted to the drafting of legislation, the enforcement of laws, and to forces antagonistic to child-labor reform. In his address, John Golden, president of the United Textile workers of America, stated that Massachusetts was falling behind in the prohibition of child labor, and on this account was retarding the movement for the increased protection of the child workers in the South. He stated that children are employed because they are cheap and unresisting; that personal investigation had shown great numbers of children under twelve in the textile mills in Maine, although the law establishes fourteen as the minimum age; that many of these children were virtually robbed of much of their pay by various unfair agreements; and that rising prices made it somewhat more necessary for fathers to send their children to the factories. Mr. Charles F. Smith, a manufacturer of New Britain, Conn., stated that his experience showed that, although boys of sixteen commanded somewhat higher pay, they were relatively cheaper than boys of fourteen. Rev. John H. Holmes of New York severely arraigned the church for its indifference

to such problems. Among the reasons for this indifference he pointed to the evils of denominationalism, concern with the next world instead of this, and devotion to foreign missions. Ex-Governor Guild of Massachusetts made a strong plea for the enactment of the following amendments to the Massachusetts laws: shorter days for children of 14-16; abolition of night work for the same; health certificates for factory employes; prohibition of employment in dangerous trades; and regulation of certain street trades. Dr. Felix Adler, chairman of the National Committee, declared that the American people are inspired by "a delirium of work"; and that the fundamental reason for child labor is that the American people are exploiting themselves. Reports were presented on the progress in Pennsylvania, Louisiana, Wisconsin, Massachusetts and other States. Very great stress was laid on the need and advantages of vocational training as a means both of increasing efficiency and of putting youth in contact with advantageous fields of employment. Special reports were presented on the employment of children in the canning industries of New York State and in the tobacco fields of Kentucky; and on the employment of the same children in the truck gardens of Maryland in summer and in the oyster fisheries of Florida in winter.

At a meeting in Washington, D. C., January 17-19, at the call of the National Civic Federation the representatives of many public bodies discussed uniform legislation in general and adopted a resolution calling for a high standard of uniform child labor laws. This resolution followed a summary of existing laws and an analysis of a proposed uniform law by Isaac Seligman of New York.

In New York City a general committee on child welfare was organized, including Miss Helen Gould, Dr. N. M. Butler, R. Fulton Cutting, Robert W. De Forest, V. Everett Macy, E. R. A. Seligman and many other leading citizens and philanthropists. It provided sub-committees on houses, health, Sunday schools, work and wages, laws and administration.

The Southern Conference on Women and Child Labor formed a permanent organization in Memphis, Tenn., on April 13. Governor Patterson, who had called the Conference, was elected president. Its object is to secure uniform legislation. The Southern Conference for the protection of working women and children adopted again resolutions which had been adopted at the Child Labor Conference at Nashville and New Orleans in preceding years. The States of Louisiana, Mississippi, Arkansas, Wisconsin, Georgia, Kentucky and Tennessee were represented; and eight cotton manufacturers were present. Vigorous exception was taken to the proposal of Dr. Stiles of the Rockefeller hookworm commission, that children of the poor whites be gathered into the mill towns in order to facilitate their treatment for hookworm. The Conference held this policy to be hostile to child labor welfare and urged a campaign for better sanitation on farms and in rural schools.

**LEGISLATION.** By a law effective August 1, Massachusetts became the twelfth State requiring a certificate of physical fitness for children seeking employment. The law requires that children of ages fourteen to sixteen present a certificate from a specially appointed physician showing sound health and physical strength before the school authorities and others may grant

age or school certificates. By another law the State Board of Health is empowered to determine whether any trade or process of manufacture is sufficiently injurious to the health of minors under eighteen years to warrant their exclusion therefrom. A fine of \$200 is imposed upon any manufacturer refusing to follow the mandate of the Board. In the same State the Supreme Court had sustained the judgment of lower courts that acting was prohibited for children under fourteen years. Theatrical people and others at once began a movement to have a law passed exempting child actors from the provisions of the child labor laws. The widest possible agitation was stirred up by those favoring and those opposing; and a bill exempting child actors was defeated. After five years' agitation a law was passed in New Jersey restricting the night employment of children in factories which operate a double shift. The chief opposition came from the glass manufacturers. The law provides that after July 4, 1910, no child under fifteen years may work at night, and after July 4, 1911, no child under sixteen. New Jersey, Illinois, New York and Ohio have thus forbidden the employment of children at night in glass factories; campaigns to a similar end are now on in Pennsylvania, Indiana, and West Virginia. New York enacted a law forbidding the employment of any person under twenty-one years of age as a night messenger, that is between 10 P. M. and 5 A. M. The employment of messengers was regulated also by Ohio, Maryland and Virginia. The Ohio law forbids such employment for persons under eighteen, between 9 P. M. and 6 A. M. Maryland forbids such employment during the day for persons under fourteen and at night for persons under sixteen, and forbids sending any minor to any house of ill repute. The Virginia law is similar to this last provision of the Maryland law. New York forbade the employment of children under sixteen in bowling alleys or as ushers, checkers, etc., in places of amusement, after 9 P. M. It also increased the list of dangerous trades; revised the adult delinquency law, which punishes parents for the delinquency of their children; and required that the names of immigrant children at Ellis Island be reported to the school authorities in the city of their destination. In Ohio the law regarding the granting of age and school certificates was revised so as to require more documentary proof; certificates are to be issued for a specific employment, and the employer is required to return this certificate to the school authorities within two days after the child leaves his service. Rhode Island repealed the law allowing mercantile establishments to employ children on Saturday evenings and on four evenings preceding Christmas, and passed a law requiring educational qualifications. Kentucky revised its law of school certification.

A law of Pennsylvania, effective January 1, made little change except in the manner of securing certificates. It provided that the issuance of certificates to children of ages 12 to 16 should be transferred from magistrates and notaries public to the public school authorities. The result was that hundreds, even thousands, of children previously employed in shops, mills, factories and mines were compelled to attend school.

**CHILD LABOR COMMITTEE.** See CHILD LABOR.

**CHILE.** A South American republic extending along the Pacific coast from Peru to Cape Horn. The capital is Santiago.

**AREA, POPULATION, ETC.** The 23 provinces and one territory constituting the republic have an estimated area of 292,419 square miles (including the province of Tacna, 9248 square miles, still held by Chile, though claimed by Peru). Estimated population in 1908, 3,302,204. A more recent, though perhaps less accurate, estimate is 3,871,000. The larger cities, with population, November, 1907, are: Santiago, 332,724; Valparaíso, 162,447; Concepción, 55,300; Iquique, 40,171; Talca, 38,040; Chillán, 34,269; Antofagasta, 32,496. More recent estimates give Santiago about 400,000, but this figure is probably too large. In 1908 there were 129,733 births, 104,226 deaths, and 21,483 marriages. Immigrants in 1907, 8462; in 1908, 6024; 1909, 3098.

Primary instruction is free, but not compulsory. Public primary schools number about 2300, with an average attendance of about 172,000. There are about 80 lycées for secondary instruction, 15 normal schools, and various institutions for technical instruction. Higher education is provided at two universities. The state religion is Roman Catholicism, but religious toleration prevails.

**AGRICULTURE, ETC.** Wheat and other cereals constitute the most important crops, but fruits, vegetables, and wine are produced in large quantities. Reported area under cultivation in 1908, 7,828,128 acres; 1909, 9,211,324. Reported wheat yield for 1908, 18,922,462 bushels; 1909, 22,333,303 bushels; estimate for 1910, 23,642,000 bushels. Pastoral interests are developing notably, a recent estimate of livestock placing the number of cattle at 2,674,666; horses and mules, 746,150; sheep, 4,598,109; goats, 476,338; swine, 338,993. Reported annual slaughter: Cattle, 450,000; sheep, 600,000; swine, 140,000.

**MINING.** Chile owes its material prosperity largely to its mineral resources. According to the National Society of Mining, the total mineral production in 1908 was valued at 268,094,228 pesos (\$96,522,922) and in 1909 at 261,118,827 pesos (\$94,002,778). The decrease was due chiefly to a fall in the price of sodium nitrate, the most important product, which is mined in Antofagasta and Tarapacá. It is stated that the total capital invested in the nitrate industry is \$127,500,000 (\$53,500,000 British, \$52,500,000 Chilean, \$16,500,000 German). Reported production of leading minerals in 1908 and 1909 respectively: Nitrate, 19,709,743 metric quintals (of 220.4 pounds), valued at 215,033,298 pesos, and 21,015,125 quintals, 208,470,040 pesos; copper, 42,097 metric tons, 27,156,579 pesos, and 42,726 tons, 26,447,516 pesos; coal, 939,836 metric tons, 13,157,704 pesos, and 898,971 tons, 11,686,623 pesos; iodine, 330,090 kilograms, 3,928,171 pesos, and 474,200 kilos, 5,571,850 pesos; silver, 52,435 and 44,283 kilos; gold, 1189 and 1268 kilos; salt, 15,250 and 20,463 metric quintals; sulphur, 2705 and 4508 metric tons; sulphuric acid, 797,600 and 1,415,000 kilos.

**MANUFACTURES.** The leading manufacturing establishments are those concerned with the treatment of ores and other minerals. Statistics for 1908 show 4758 industrial establishments operating with more than four employes each; of these, 965 were engaged in hide, skin, and

shoe industries, 866 in food industries, 669 in metal industries, 555 in clothing manufacture, 439 in wood manufacturing, etc., 209 in paper and printing industries, and 204 in the preparation of alcoholic beverages. Total capital, 339,092,971 pesos; production, 469,123,133 pesos (the cost of raw materials being 257,000,000 pesos); employes, 67,355.

**COMMERCE.** The values of imports and exports in thousands of pesos have been as follows:

	1906	1907	1908	1909
Imports .....	237,698	293,682	267,264	262,083
Exports .....	289,621	280,081	319,149	306,430

Details of the special trade for 1909 are given in thousands of pesos as follows: ..

Imps.	1000 pesos	Exps.	1000 pesos
Textiles .....	64,141	Nitrate .....	210,870
Min. prods. ....	46,793	Copper .....	21,752
Coal, oils, etc. ..	45,928	Wheat .....	14,221
Veg. prods. ....	29,194	Iodine .....	5,572
Machinery .....	28,264	Calc. borate....	4,451
An. prods. ....	27,959	Barley .....	4,426
Paper, etc. ....	7,050	Oats .....	3,677
Chem. prods. ....	5,601	Wool .....	2,648
Liquors .....	5,433	Leather .....	2,536
Arms .....	2,302	Flour .....	1,090
		Seed .....	1,082
		Bran .....	963

The export of mineral products has been: in 1907, 242,030,200 pesos; in 1908, 271,459,100; in 1909, 241,527,700. Imports from and exports to the countries commercially most important, in thousands of pesos:

	Imports		Exports	
	1908	1909	1908	1909
Great Britain .....	83,920	87,340	149,356	128,570
Germany .....	76,763	62,046	67,595	63,567
United States .....	24,386	26,401	44,064	53,840
Australia .....	17,169	8,751	19,115	251
Belgium .....	12,757	7,536	8,658	7,941
France .....	11,945	15,511	7,141	14,293
Argentina .....	10,535	18,130	.....	2,173
Peru .....	10,214	12,994	3,432	2,824
Netherlands .....	.....	149	7,141	9,194

**SHIPPING.** There entered in 1909 14,587 vessels, of 24,923,308 tons (steam, 13,262, of 23,280,626 tons), and cleared, 14,402, of 24,696,585 tons (steam, 13,306, 23,264,420 tons).

**COMMUNICATIONS.** In the autumn of 1910, it was reported that the government had 1677 miles of railway completed and 1346 miles under construction, and private companies 1920 miles completed and 106 under construction. The Trans-Andine Railway was opened to traffic on the Chilean side on April 4, 1910. Telegraph lines (1909), 17,388 miles; offices, about 1400; post-offices, about 1100.

**FINANCE.** Revenue for 1908 is reported at 72,447,364 pesos gold and 132,959,840 pesos paper. The gold peso is worth 36.5 cents, and the paper peso averaged about 20 cents in 1908 and 21 cents in 1909. On October 5, 1909, the finance minister estimated the ordinary revenue for that year at 68,500,000 pesos gold and 127,300,000 pesos paper; ordinary expenditure, 58,171,878 gold and 172,584,404; total expenditure, 62,221,878 gold and 194,129,888 paper. Budget for 1910: Revenue, 69,000,000 gold and 138,575,000 paper; expenditure, 52,725,003 gold and 163,739,766 paper. Revenue is derived mainly from export duties on nitrate, customs, and the

railways. The largest expenditures are for the debt, army and navy, department of the interior, and public instruction. Foreign debt, December 31, 1909, £23,036,736; on December 31, 1910, £25,239,320. Internal debt at end of 1909, 15,659,344 pesos paper; outstanding paper currency, about 150,000,000 pesos. Total deposits in the banks, December 31, 1909, 394,614,515 pesos gold.

**ARMY.** The active army consists of 4 divisions, distributed territorially for mobilization, and each comprises the three arms of the service. The establishment is estimated at about 18,000 men, which in time of war could be increased to about 150,000 men. By including a part of the National Guard the entire war strength is estimated at 350,000 men, out many of these have received little or no military training. In 1910 there were 10 regiments of infantry; 8 of cavalry; 20 batteries of field artillery, one mountain battery, 2 battalions of mounted infantry and a corps of engineers. While all able-bodied citizens are liable to service in the army, the annual quota for the active army is only about 17,000.

**NAVY.** In 1910 the navy included 3 armored battleships, aggregating 19,000 tons; 1 armored cruiser (7000 tons); 4 protected cruisers (14,500 tons); 4 torpedo gunboats (1470 tons); 7 torpedo-boat destroyers (2270 tons); 5 first-class torpedo boats (728 tons); and several auxiliary vessels. It was reported that on August 30, 1910, the government asked for bids on the construction of two 25,000-ton battleships having a speed of 23 knots.

**GOVERNMENT.** The executive authority is vested in a president, elected for five years and assisted by a responsible council of state and a responsible ministry. The legislative power devolves upon a congress of two houses, the Senate (32 members) and the Chamber of Deputies (94). The President for the term beginning September 18, 1906, was Pedro Montt. He died August 16, 1910, and was succeeded by the Vice-President, Elias Fernández Albano. Señor Albano died September 6 and, under the Constitution, the executive duties were assumed by Emiliano Figueroa, the Minister of Justice. Subsequently a new incumbent was chosen on November 15 in the person of Ramón Barros Luco, who was inaugurated December 23, 1910.

**HISTORY.** The long-standing difficulty with Peru over the status of Tacna and Arica, may be summarized as follows: According to the treaty of October 20, 1883, after the war between the two countries, Chile was to keep Tacna and Arica and to administer these provinces with her own officers and under her own laws until a plebiscite should decide to which country the natives of the provinces wished to attach themselves. This plebiscite was to be subsequently determined by a special protocol between the two governments. Though there seemed a prospect of adjustment in 1908, the affair was still left in an indeterminate state and has continued to cause much friction. In 1910, difficulty arose over the ecclesiastical question. Chilean priests appointed by the government to minister to Chilean residents were unable to perform their duties because the Peruvian Bishop of Arequipa, claiming jurisdiction, refused his spiritual sanction. The Bishop also objected to the requirement that Peruvian priests should apply to the Chilean government for the right to minister, which requirement was

made by Chile. When the Chilean government commanded them to do so, they refused and the government thereupon forbade them to minister and closed the churches. The priests, however, officiated in secret and the Chilean government in March asked them to leave the country. Peru retorted by withdrawing her diplomatic representatives, and in April made a formal demand for arbitration.

The President, Señor Pedro Montt (q. v.), who had held office since 1906, died at Bremen on August 16 and Señor Elias Fernández Albano, Vice-President, who was acting as chief executive in his absence, continued in that capacity, but he in turn died on September 6, when the campaign for the election of President was going on. Señor Ramón Barros Luco, a Liberal, was chosen. The Minister of Justice, Señor Figueroa, was acting President in the interval.

In June it was announced that the Chamber of Deputies had authorized the President to place a loan of \$20,000,000 for new warships and naval defense. Early in July Congress voted for defense purposes the sum of 22,400,000. On September 13, Chile signed an arbitration treaty with Argentina. The centennial anniversary of Chilean independence was celebrated on September 18. For an account of the arbitration of the Alsop case, see **ARBITRATION, INTERNATIONAL.**

**CHINESE EMPIRE.** A monarchy of eastern Asia. The capital is Peking.

**AREA AND POPULATION.** The area in square miles, and the population, are stated as follows (the first column for population being the Chinese estimate of 1902; the second, an estimate accepted by many as more nearly accurate):

Empire	Sq. mi.	Pop.	Pop.
China Proper	1,532,420	407,253,030	320,500,000
Manchuria	863,610	16,000,000	5,530,000*
Mongolia	1,367,600	2,600,000	1,850,000
Tibet	463,200	6,500,000	2,250,000
Chinese Turkestan, etc.	550,340	1,200,000	.....
Total	4,274,170	433,553,030	.....

\* Probably too low.

During 1910 there was some discussion of the size of the Chinese population and of the enormous discrepancies existing between various estimates. It is now believed generally that the traditional figure 400,000,000 is far too high and that even 300,000,000 may be regarded as the maximum, although in 1906 the Chinese Imperial Customs put the total at 438,214,000. In 1904, the American minister at Peking, after careful inquiry, estimated the population of China proper at 270,000,000. In 1909, a house census, ordered by the government, showed about 27,000,000 habitations, not including those in Mongolia, Tibet, the Amur, Shansi, Kwangsu, and Szechuan. It appeared that there was a not unnatural tendency on the part of the people to conceal the truth, on account of their apprehension that the taking of a census precludes an increase of taxation. Allowing that concealments to the extent of one-fifth took place, it appears that the number of houses is not more than 33,000,000, which, at the rate of 5.5 persons per house, gives a population of less than 182,000,000. To this must be added the population of the six districts excluded above, and among them Szechuan alone has been

estimated to have 40,000,000 inhabitants. Still it would seem that the total population of the empire does not greatly exceed 270,000,000. The number of houses in Peking and its suburbs is returned at 251,014, which represents a population of about 1,400,000. In Manchuria, the province of Feng-tien is credited with 803,390 houses (upwards of 4,400,000 inhabitants), and Kirin with 738,480 houses (about 4,050,000). Estimates, by the Imperial Customs, for the larger treaty ports are (1908): Canton, 900,000; Hankow, 820,000; Tientsin, 800,000; Shanghai, 651,000; Foochow, 624,000; Chungking, 610,000; Soochow, 500,000. In 1909 the number of foreigners living in the treaty ports was upwards of 88,000, of whom over 55,000 were Japanese.

The three recognized religions are Confucianism (the state religion), Buddhism, and Taoism. Native adherents of religions properly foreign to China include about 30,000,000 Mohammedans (probably this estimate is too high), 1,000,000 Roman Catholics, and 150,000 Protestants.

**EDUCATION.** There are three classes of schools—the old-style schools, the mission schools, and the institutions which are being established by the government pursuant to the Imperial decree of September 3, 1905. The old-style schools are private institutions whose curriculum is practically confined to the Chinese classics, examination in which, for state employment, was abolished by the above-mentioned decree. This decree, which has given an enormous impetus to the movement for "Western learning," provides for an elaborate system of education, modeled on that of Japan. Naturally considerable time must elapse before the system is satisfactorily developed, but already results are very encouraging. The missions conduct a large number of schools from primary to collegiate rank; in 1907, the reported number of mission primary pupils was 42,546 and of pupils in higher mission schools 15,137. Besides the Imperial University at Peking, which is a government institution with European, Japanese, and Chinese professors, there are various schools or colleges for higher and technical instruction.

**INDUSTRIES.** China proper is a distinctively agricultural country. In the north, the principal crops are wheat, barley, corn, millet, and other cereals, and beans and peas; in the south, rice, sugar, indigo, and cotton. Tea and silk cocoons are important products, the former in the west and south, the latter in every province. About 27 per cent. of the world's supply of raw silk comes from China. Large amounts of opium have been produced, but, pursuant to government decree, the output is being restricted and, it is expected, will cease entirely by 1916. The opium question will be discussed at an international conference at The Hague in 1911.

The country is rich in minerals, but for the most part they are little exploited. Those worked to a greater or less degree include coal, tin, iron, antimony, lead, zinc, copper, and salt. Of the metals, tin (in Yunnan) and iron are the most important.

Manufacturing, in the Western sense, is comparatively small, but the textile and iron industries in particular are showing considerable development. The number of spindles in operation in 1909 is placed at 750,000.

**COMMERCE.** Imports for consumption and ex-

ports of domestic produce have been valued as follows in Haikwan taels (the Haikwan tael was worth about 79 cents in 1907, 65.5 cents, July 1, 1908, and 63.4 cents, July 1, 1909):

	1907	1908	1909
Imports .....	416,401,369	394,505,478	418,158,067
Exports .....	264,380,697	276,660,408	338,922,814

Principal articles of import in thousands of Haikwan taels:

Total .....	264,381	276,660	338,993

The trade with Hongkong and Macao is chiefly transit. The more salient features of the foregoing tables are the expansion of exports in 1909, the very rapid growth of the soy-bean and bean-cake industry, the remarkable development of both imports from and exports to Russia, and the continued unsatisfactory condition of the trade with the United States.

SHIPPING. In 1908 and 1909, the entrances and clearances combined, including junks, in both the foreign and the coasting trade were as follows:

Flag	Vessels	Tons	Vessels	Tons
British .....	28,445	34,406	27,699	34,027
Japanese .....	30,708	18,055	30,808	18,949
Chinese .....	136,663	16,946	135,053	17,861
German .....	5,496	6,586	5,854	7,244
French .....	3,901	5,072	5,141	4,920
Other .....	2,392	2,927	3,961	3,771
Total .....	207,605	83,991	208,516	86,772

In 1908: steam, 86,600 vessels, of 77,955,525 tons, and sail, 121,005, of 6,035,764 tons; 1909: steam, 87,802 vessels, of 80,613,890 tons, and sail, 120,714, of 6,157,919 tons.

COMMUNICATIONS. Roads in China are numerous, but generally in a poor state of repair. More important commercially are the rivers and canals, by means of which junks carry on an enormous amount of traffic. Including the Manchurian lines, there were open to traffic in 1909 about 4700 miles of railway; in 1910, about 4840 miles. New lines and extensions embracing a large mileage are under construction, and many others projected. Telegraphs (1909): miles of line, 26,413; of wire, 43,011; offices, 490. Posts (1909): offices, 4258; pieces handled, 344,197,000. The postal service has been much developed during the last three years. Letters can be sent throughout the 18 provinces at a uniform rate of two cents per half ounce. Postal lines have been extended as far as Tibet. A money order system is in operation throughout China proper, and an express delivery service in the large cities.

FINANCE. No comprehensive statements of revenue and expenditure are officially published. Except the foreign maritime customs, most of the revenue is collected by provincial agents, and probably a considerable part of it remains with the collectors. An unofficial estimate in 1901 placed the revenue and expenditure at 88,200,000 and 101,120,000 Hk. taels respectively. A 1908 estimate placed the revenue at 105,000,000 Hk. taels. Receipts from customs: 1907, 33,861,346 Hk. taels; 1908, 32,901,895; 1909,

35,939,917. The last figure comprehended import duties, 14,084,736 Hk. taels; export duties, 12,335,675; coasting-trade duties, 2,016,506; tonnage, 1,276,218; transit, 1,920,817; opium likin, 3,905,965. Toward the end of 1910 a report was current that the government was hard pressed in devising means to meet an apparent deficit of some 75,000,000 Hk. taels. It appeared that further external loans were regarded as dangerous in inviting foreign hold on the country, and increased taxation seemed impracticable. According to this report the foreign debts had reached a total of £155,040,372 (\$754,303,970). The latest available complete statement of the debt (March 2, 1908) is as follows: £38,839,600 (\$189,012,913); 499,978,000 francs (\$96,495,754); 452,653,000 Hk. taels (\$294,224,450); total, \$579,733,017.

The Haikwan tael, which is the unit of value used by the Maritime Customs, fluctuates in value with the price of silver, being worth 65.5 cents on July 1, 1908, 63.4 cents on July 1, 1909, 62.6 cents on December 31, 1909, and 67.3 on December 31 1910. The government has taken measures for the establishment of a uniform national coinage. See below, paragraph *Currency Reform*.

ARMY. Much interest attaches to the reorganization of the Chinese Army, which has been in progress since the promulgation of the law of January, 1905. China possesses a National army consisting of the active army and first and second reserve. The plan of organization involves 37 divisions including all arms of the service, and by 1913 it was expected that these divisions would number 28,000 officers and 430,000 men of whom 380,000 would be available combatants. Service is voluntary and selected recruits are taken to serve for three years with the colors, after which there is optional and paid service in the first reserve for three years, followed by 4 years spent in the second reserve. In 1910 it was estimated that probably 20,000 soldiers had passed into this reserve. The training of the forces was being directed by Japanese officers, and military schools are maintained in the various provinces. During the year 1910, on the return of Prince Tao from America and Europe and the appointment of a new Minister of War, Yin-Chang, a number of military reforms were inaugurated, which met with approval on the part of the native press. The two most important reforms consisted of the creation of a War Council of Defense (Kium-che-wei-y-kin) and the placing of the first, second, third, fourth, and fifth divisions under the direct orders of the Ministers of War, making them independent of the authority of the viceroys of the provinces. This last measure was expected to result in great economy, and it was an important feature in the unification of the new National army and afforded the central government a direct and quick means of control. Minor reforms involving the centralization of power in the Peking government were in progress, especially in connection with the uniform system of instruction and disbanding, reports to superior officers and the transfer to Peking of the school of gendarmerie from Taku, placing it under the orders of the War Minister. There was under discussion during the year a number of projected reforms, of which the following were the more important: the creation of new divisions in the army, 5 for Mongolia, 7 for Tibet, and

Sungaria, 2 for Manchuria, so that with the 36 divisions in progress of formation, there would be eventually 50 divisions. An official was appointed to supervise the establishment of these organizations on the frontiers. Another important reform contemplated was an army separation of the Siun-tang-toei, or bands of police and the transfer of their functions to various divisions of the Lou-kiun or active regular army. Much sympathy with these reforms was manifested by the press and the spirit of young China, though there was considerable opposition. The Chinese Army consisted in 1910 of the new National active army (Lou-Kiun), the auxiliary or police forces (Siun-fang-toei), the force of modern police (Siun-king-kiun), contingents of the Manchurian banners (Pa-k'i), remains of the old army of the Green Flags (Lou-Yng), rural militia (Toan-lien), Mongolian and Tibetan contingents; river troops (Choei-che-ying and Choei-che-Kiun K'ing). A complete system of military education had been introduced and student officers were being sent to Japan for study and service with Japanese troops.

The effective and combatant strength actually serving with the colors in 1910 was as follows: Infantry, with 74 machine guns of vari-

ous types .....	117,500
Cavalry .....	8,240
Artillery, with 780 guns.....	13,700
Engineers .....	6,875
Train .....	6,000

Total .....152,556

Of these 152,556 were considered sufficiently well trained and organized to conduct themselves creditably in the field.

**NAVY.** The navy in 1910 was reported to include 4 cruisers (one of 4300 tons and 3 of about 3000 tons each), various miscellaneous vessels (including 8 old cruisers), several old torpedo boats, dispatch boats, etc., and about 20 modern gunboats. Two small cruisers (2400 tons each) were under construction in England. About the end of 1910 the government awarded a contract for the construction in the United States of a second-class cruiser of between 4000 and 5000 tons to cost upwards of \$1,000,000.

**GOVERNMENT.** The authority of the sovereign is limited or modified by certain advisory bodies, as the Grand Council, the Government Council, and (since 1907) the Senate, and by the powerful provincial viceroys. An edict of August 24, 1908, promised a constitution and Parliament in 1917. Deliberative Provincial Assemblies, which were encouraged by the government for their educative value, met for the first time in October, 1909. In 1910 the demand for representative government increased, and late in the year it was announced that the constitution, the law of election, and the law relating to the parliamentary houses would be promulgated in July, 1911, that the general election would take place in May, 1912, and that the Parliament would be opened early in 1913. The historic system of examination in the Chinese classics for political preferment has been abolished since 1905. The Emperor Kwang-Hau died August 14, 1908. He was succeeded on November 14 by his brother's son, Pu-yi, who was born February 11, 1906. The Emperor's father, Prince Chun, is Regent.

#### HISTORY

**BEGINNINGS OF REPRESENTATIVE GOVERNMENT.** It will be remembered that definite

steps were taken in 1907 and 1908 toward the establishment of parliamentary government. In the former year commissioners went to Germany, Great Britain, and Japan to study the constitutional systems of those countries and a government council was appointed to make a preliminary report on the establishment of a regular Parliament. A plan for a National Assembly was outlined in an Imperial decree on September 20, 1907. On July 22, 1908, an Imperial decree was issued providing for Provincial Assemblies deliberative in character, and serving as a basis for a future Parliament. On August 27, 1908, the Imperial government issued a decree definitely outlining a constitution and promising the establishment of a Parliamentary system within nine years. In 1909 elections were held for the new Provincial Assemblies which met in October of that year. Meanwhile the regulations to govern the new National Assembly had received Imperial approval on August 23. On May 9, 1910 an Imperial decree announced the inaugural meeting of the new body for October 3, on which date it was opened by the Prince Regent. It had advisory powers only. It was to form the nucleus of the Houses of Parliament, for though consisting of a single Chamber, it comprised elements which might well divide into two houses, namely, representatives of the privileged classes and representatives of the Provincial Assemblies. Subjects within the competence of the new body are as follows: Financial questions, including the national receipts and revenue, preparation of the budget, taxation, public debts, legal questions, that is to say, consideration of new codes, which, however, must receive Imperial approval before discussion by the Assembly; and also such questions as may be referred to the body by the Emperor. Any resolution agreed upon by the Assembly must receive Imperial sanction before having legal effect and must also have been framed in consultation with the Grand Council or with one of the Ministers. If either of the latter should disagree with the Assembly, both opinions must be referred to the Emperor for decision. As to the relations of the National and Provincial Assemblies, the former is to decide any matters upon which the Provincial Assemblies and the Governors cannot reach an agreement or upon complaints against any viceroy or governor, this decision to be subject to Imperial sanction. Petitions may be received from Chinese subjects through members from the same portion of the country. The expenses of the members are to be defrayed by the government. Should members disobey the command to attend sessions or should the National Assembly pass resolutions injurious to the public order or bring the government into contempt, the body may be dissolved. On October 23 it was announced that the new National Assembly had joined unanimously in supporting the demand for the calling of an official Parliament. Seven years must still elapse, according to the government programme, before the constitutional system was completed with the establishment of a full Parliament, but the popular movement for hastening this result had been gaining force rapidly during recent months. After debating the question, the Assembly finally decided upon a memorial to the Crown, urging the immediate assembling of a Parliament. On receiving this memorial an Imperial edict was

issued ordering the Government Council to consider it. An address by Prince Yu-lang before the Assembly on October 31, declared that the whole nation agreed in desiring an early meeting of Parliament. This was interpreted as proof that the government would accede to the request and was received with great enthusiasm. After agreeing at first to shorten the interval to three years, the Imperial government acceded to the Assembly's renewed request for the immediate summoning of Parliament and issued an edict directing that preparations be made for calling the new body. There was a violent discussion in the Assembly on November 22, on account of the alleged encroachment on the National body's rights by the Grand Council, and the House finally decided unanimously to appoint a committee to draft a protest against the action of the Council and lay it before the throne. The Assembly later adopted a memorial, declaring that the powers of the Grand Council were now undefined and unless it was made answerable to the people the formation of a responsible cabinet was necessary. The proposal was rejected. Thereupon the Assembly prepared a fresh memorial condemning the acts of members of the Council and demanding that that body should be made responsible to the people. On December 25 an Imperial edict ordered the Constitutional Bureau to prepare at once a constitutional programme including a plan for a cabinet. This was taken as evidence that the government would yield to the demands of the reformers.

**TROUBLE WITH TIBET.** Early in January serious complaints were made of the brutalities of Chinese troops in Tibet, who were accused of destroying certain monasteries and desecrating others, and of killing a number of the Lamas. After the Younghusband mission, provisional governors or Ambans were appointed to administer the Tibetan government by the Chinese authorities. In 1909 a body of Chinese troops were dispatched to the Szechuan frontier where they put down with some severity the resistance of the Lamas. Upon the Dalai Lama's return to Lhasa, having, it is said, Imperial authority for assuming supreme control, a conflict of jurisdiction arose between him and the two Ambans at Lhasa. The rule of the Ambans was opposed by the Tibetans on the ground that it was arbitrary, and disregarded the wishes of the natives. Altogether, there were six Chinese mandarins holding the office of Amban in various parts of Tibet. The petitions of the natives to the Chinese government and to Lord Minto for redress of the alleged grievances were unavailing and the threat was made that if the Ambans and the troops were not withdrawn, a revolt would follow. The Chinese forces in Tibet were estimated at 25,000. In February the Dalai Lama fled from Lhasa to India, apparently en route to Peking, and on February 22 Chinese troops occupied Lhasa. After his arrival in India it was announced in March that an edict from Peking had been issued, deposing him and stripping him of all his dignities. It was alleged by the Dalai Lama and his supporters that the Amban in Lhasa to whom he had complained of the atrocities of the Chinese on the Szechuan frontier, the killing of the Lamas and the sacking of monasteries, had disregarded his authority, and called upon the Chinese troops to enter Lhasa. Great Britain and Japan jointly urged on the Chinese

government the need of maintaining peace on the Anglo-Tibetan border.

**RAILWAYS.** For an account of the proposals of the United States government for the neutralization of the Manchurian railways, see UNITED STATES, paragraphs on *Foreign Relations*, and JAPAN, paragraphs on *History*. Japan had raised objections to the Chinese project of a railway from Chinchow-Fu to Sigun, and the French and British governments advised China not to go on with it, without the approval of Japan and Russia. On February 18, 1910, Japan withdrew her objections on condition that Japan should participate in the financing and building of the line, and that China should subsequently build a line connecting it with the Southern Manchurian railway. The demand supported by the United States government, that American capital should participate in the Hankow-Szechuan railway loan had been conceded in 1909, and on May 24, 1910, the four groups of financiers interested signed an agreement whereby the loan was shared equally by American, French, German, and English capital. A postal agreement between China and Japan in February restored to China her monopoly of mail carrying on her own lines and gave her equal rights with Japan over Japanese railways.

**CURRENCY REFORM.** The Imperial government issued a decree on May 24, commanding that the unit of national currency should be the yuan or dollar and that the temporary standard should be silver. It prescribed the weight of the dollar and defined the nature of the subsidiary coinage. It provided for the gradual calling in of the old coinage and required that after one year payments of taxes and of all government charges should be made in the new currency. The Peking bankers agreed to cooperate with the government in carrying out its plan. A group of American financiers acting under the encouragement of the United States government offered to loan \$50,000,000 at 5 per cent. to the Chinese government in furtherance of its currency scheme, and in connection with the loan it was proposed that an American financial adviser should be appointed at Peking. A preliminary agreement covering the loan was made toward the end of the year, and the United States government received assurances that an American adviser would be engaged.

**OPIUM TRAFFIC.** According to the regulations decreed by the Chinese government in 1906, the cultivation of the poppy and the taking of opium should cease gradually within a period of ten years and cultivation of the poppy should be reduced at the rate of one-tenth a year. The rules also provided for the registry of opium users, of opium shops, of sales, etc., and prohibited the use of opium by teachers, soldiers, and sailors. In 1907 an agreement was reached with the British government whereby 51,000 chests were taken as the standard of annual exportation from India, and from this quantity there was to be an annual diminution of 5100 chests with a view to bringing the traffic to an end after ten years. In 1909 at the intervention of the United States government an International Conference on the Opium Trade was held at Shanghai. It passed a number of important resolutions, urging the government to inquire into the best means of curing the opium habit and into the general medical aspects of the question, declaring that the Chinese

government was sincere in its suppression and had made progress, and laying down the principle that each country ought to control the trade in morphine, etc., and prevent its shipment; and that it should suppress opium smuggling and close the opium dens of its own settlements. The United States government urged the Powers to hold a second conference in 1911 and eleven governments agreed (see OPIUM) in 1910. The British government in announcing its acceptance in September excluded from discussion the existing agreement between the British and Chinese governments as to the opium trade. The suppression of the opium traffic naturally had a very important effect on the trade of India in the drug, since about two-thirds of the Indian exports of opium went to China. Nevertheless, the entire revenue of the Indian government from opium increased from £3,273,000 in 1907-8 to £4,432,000 pounds in 1909-10. This was explained by Mr. Montague of the Indian government in his budget speech in July, 1910, as arising from the higher prices obtained for opium and the falling off in expenditures in Bengal owing to reduced operations, and also to the receipt of certain duties in advance. He said that while during the first five years of the period of gradual suppression the Indian revenues were not likely to suffer, there would be more serious effects upon them during the next five years. At the meeting of the World Missionary Conference at Edinburgh in 1910 a resolution was passed expressing the wish that the British Imperial and Indian governments would meet the financial difficulties caused by the cessation of the opium revenue without increasing the taxation of the people or injuring the Feudatory States concerned. In January, 1910, the British Foreign Office published a report on the results of the Chinese government's efforts to suppress the opium evil. It said that the anti-opium campaign, begun in 1907, had caused a material reduction in the consumption and cultivation of opium and had greatly aroused public opinion on the subject. It said further that gradual suppression within a definite period of time was the policy generally favored, but that the officials generally took too sanguine a view as to the time within which it would be accomplished. There were continued difficulties in regard to the regulation of the opium traffic during 1910 (see HONG KONG), and the government's policy was considered too strict by many British merchants. See also OPIUM.

**OTHER EVENTS.** Rioting occurred in May at Changsha and its neighborhood, when a Lutheran chapel was destroyed and many houses burned down. The British and Japanese governments demanded reparation for the damage done to property of their subjects, but restricted their claim to money payments. There were fears of an anti-foreign outbreak at the Nanking Exhibition, but it was opened on June 5 and no disturbance occurred. The government had a large body of troops in readiness to put down any disorder. In August it was announced that Wu-Ting-Fang, former Minister to the United States, was to be appointed to the newly created office of adviser to the Foreign Office. In the same month important changes in the administration became known, marking the virtual restoration of the party of reform to the Ministry. An Imperial edict appointed a former follower of Yuan-Shih-Kai President

of the Ministry of Communications.' During the latter part of the year there were frequent rumors of palace intrigues arising from the present empress dowager's desire to control affairs and her hostility to the Prince Regent, and fears were expressed in the European press that she aimed at setting aside the present boy emperor Pu-yi. The Prince Regent's overtures to the party of reform were attributed to his waning power at court and to his need of popular support as an offset. Further progress was made in 1910 by the Chinese Emergency Appeal Committee in the plan for a Christian but undenominational university in Central China, and a number of grants of money were made by the Committee in connection with that object. For an account of the Russo-Japanese agreement concerning Manchuria, see JAPAN, paragraphs on *History*.

**CHINESE SERVICE.** See **EXPLORATION**, and **ASIA**.

**CHINESE SWAMP LANDS.** See **DRAINAGE**.

**CHINOSOL.** A new antiseptic drug having the chemical formula  $(C_6H_7ON)_2H_2SO_4$ . Its chemical name is oxychinolin sulphate. It is a yellow crystalline powder of saffron-like odor and burning taste. It dissolves readily in water, with difficulty in alcohol, and is insoluble in ether. The drug is a powerful antiseptic equal to bichloride of mercury and is believed to be non-toxic. As a germicide it is feeble, being weaker than carbolic acid in solutions of corresponding strength.

**CHIPMAN, HENRY L.** An American soldier, died October 25, 1910. He was born in Canandaigua, N. Y., in 1823, and at the beginning of the Civil War entered the volunteer service with a Michigan regiment. He was soon appointed a captain in the 11th infantry in the regular service. He joined the Army of the Potomac and took part in the Peninsular campaign. In 1864 he was appointed colonel of the colored volunteer regiment and commanded a brigade in a battle at Honey Hill, S. C. He also took part in the Siege of Yorktown, Gaines's Mill, Malvern Hill, Antietam, Fredericksburg, and Gettysburg. He received the brevet of major for gallantry at Chancellorsville and that of brigadier-general for service during the war. At the close of the Civil War he was appointed lieutenant-colonel in the regular army. He retired for age in 1887.

**CHLORINE.** See **ATOMIC WEIGHTS**.

**CHLOROFORM.** See **ANÆSTHESIA**.

**CHOLERA.** This disease raged in Russia with even greater severity during 1910 than in the previous year, and spread to several other countries of Europe, Germany, Austria and particularly Italy being visited. In the latter country, cholera was epidemic in several localities and many people died. Naples was for a time dropped as a port of call by steamships. In Russia, up to November, there were 170,353 cases, with 77,406 deaths. This country continues to be a menace to Europe, on account of the apathy of the government and the indifference and opposition of the people toward sanitary reforms. It is stated by

Dworetzky, of Moscow, that of 1082 cities in the Russian Empire, only 192 have a public water supply, and 38 a sewerage system. Of the 762 cities in European Russia, 149 have a public water supply and 27 are properly sewered. The Prussian government, acting on the late Robert Koch's advice, established laboratories at the junction of the Vistula and Memel rivers, to examine the crews of boats and rafts passing this point. Over 5200 persons were so examined in five weeks. As is the case with many other infectious diseases, it was found that healthy germ carriers are by no means rare, and the danger of insidiously spreading the disease is thus increased. See VITAL STATISTICS.

**CHO-SEN.** Official name for KOREA (q. v.).  
**CHRISTIAN ENDEAVOR, UNITED SOCIETY OF.** A religious society of young people, founded in Portland, Me., in 1889 by Reverend Francis E. Clark. In 1910 there were 73,531 societies with a membership of 3,676,050 chiefly in the United States and Canada, and in Australia, Great Britain, China, India, Japan, and all missionary lands. During the year a campaign for the increase of membership was carried on and this was attended with remarkable success. Over 4000 new societies were formed and about 350,000 new members were added in America alone. There was no national convention held in 1910, but a series of very successful State conventions were held. The important development of the year was the establishment and growth of summer schools and Christian Endeavor institutions. A movement has been on foot for several years for the buildings of a new international headquarters building and a site has been purchased in Boston. This building is to cost in the neighborhood of \$200,000. The officers of the Society in 1910 were: President, Rev. Francis E. Clark; general secretary, William Shaw; treasurer, Hiram N. Lathrop; editorial secretary, Amos R. Wells; interstate field secretary, Carl Lehmann.

**CHRISTIANS, or CHRISTIAN CONNECTION.** A religious denomination which had its origin in the period following the War of the Revolution when the Rev. James O. Kelly, a Methodist minister in Virginia opposed the absolute power of the bishops of the Methodist Episcopal Church in the matter of appointments to charges. He failed to bring about the changes desired and in 1792 withdrew from the church. In 1794 the body of worshippers who were joined with him took the name of Christians, taking the Bible as their guide and accepting no test of church fellowship other than christian character. The general polity of the denomination is congregational and each local church is independent in its organization. There are, however, conferences in which ministers are admitted to the membership and in which the churches are represented by lay delegates. The general agent for the churches for the conduct of their general work is the American Christian Convention, with its two incorporated departments, the Mission Board of the Christian Church and the Christian Publishing Association. According to the religious census made in 1906 and published in 1910 the total number of communicants in the denomination in 1906 was 110,117, with 1253 church edifices. The value of church property was \$2,740,322. The denomination had 1149 Sunday schools, with 10,510 officers and teachers. According to sta-

tistics gathered by Dr. H. K. Carroll in 1910, there were in the denomination 85,717 communicants, 1379 churches and 1011 ministers. The denomination carries on foreign missionary work in Japan and in Porto Rico. The churches in Japan are organized into a conference independent of any control by the denomination in the United States. Foreign missions are also carried on in the northwestern and western parts of the United States. Under the control of the denomination or affiliated with it are nine institutes and colleges. A home for aged Christian ministers is maintained at Castile, and an orphanage at Elon, North Carolina. The organ of the denomination is the *Herald of the Gospel of Liberty*, the oldest religious newspaper in the United States. It is published in Dayton, Ohio. The publishing house in that city also issues the Sunday school literature of the denomination.

**CHRISTIAN SCIENTISTS;** official designation, **THE CHURCH OF CHRIST, SCIENTIST.** A religious organization founded by Mrs. Mary Baker Eddy. It was chartered in 1879 by Mrs. Eddy and in 1881 she became the pastor of the First Church of Christ in Boston.

The teachings of the body are founded on the Bible and on the precepts contained in *Science and Health with Key to the Scriptures* by Mrs. Eddy. The central organization of the Church of Christ, Scientist, is the Mother Church in Boston. There are, however, branches in the various parts of the United States, and other parts of the world, each having its own form of government, its own rules and by-laws and its own financial affairs. There are also Christian Science Societies not organized as churches. There are no pastors in the sense in which that term is used in other religious bodies, but the lesson-sermon takes the place of the clerical address usually delivered by a pastor. The principal work of the denomination as a whole and of its individual members is summed up by them in the word "healing," by which is meant mental, moral, and physical regeneration of mankind.

According to the census of religious denominations made in 1906 and published in 1910 the total number of members of the Church of Christ, Scientist, was 85,717, with 604 organizations and 253 church edifices. No official census of the membership has been taken since 1908, but the following figures have been published as the latest available: An approximate membership of 320,000, with 997 churches and societies in the United States and foreign countries; practising healers in the United States and Canada, 3765; in foreign countries, 296. Healers are registered in practically every country in the northern hemisphere. Every State in the Union has at least one Christian Science church. The approximate value of the church property was \$28,000,000.

Mrs. Eddy, the founder and discoverer of Christian Science, died December 3, 1910. Up to the time of her death she had been the absolute head of the denomination, although her authority was exercised through the Board of Directors of the Mother Church of Boston. Although no successful effort had been made to dispute Mrs. Eddy's conduct of the affairs of the denomination, disputes have several times arisen. The most serious of these was the threatened schism in 1909 of adherents of Mrs.

Augusta E. Stetson, the First Reader of the First Church of Christ, Scientist, New York City. Mrs. Stetson had for many years been at the head of this church. Charges were brought against her by several of her students that her methods of mental healing were at variance with the principles of Christian Science. Mrs. Stetson denied these charges but was brought before committees of the First Church of Christ, Scientist, Boston, and after a prolonged hearing was deprived of her right to teach and practise and of her membership in the mother Church. The majority of those who had been adherents of Mrs. Stetson signified their approval of the action of the Board of Directors and Mrs. Stetson thereupon withdrew from all connection with the church.

Mrs. Eddy left the bulk of her estate, amounting to \$2,000,000 to the Directors of the Mother Church, Boston, who are to control it for the benefit of the church. Suits had been brought at the end of the year by her son and a stepson to annul the provisions of her will.

The supreme authority of the denomination rests with the Board of Directors of the Mother Church in Boston.

**CHRISTIAN UNITY FOUNDATION.** See PROTESTANT EPISCOPAL CHURCH.

**CHRISTOPHER, A.** See LITERATURE, ENGLISH AND AMERICAN, *Essays and Literary Criticism*.

**CHROBAK, RUDOLPH.** An Austrian physician, died October 1, 1910. He was born in Troppau, Silesia, in 1843. He studied in Vienna, where he became professor of obstetrics in 1879. His published writings include important works on anatomy and pathology within the domain of his specialty. These works form part of the handbooks of Stricker (1869-72) and Pitha-Billroth (1885), and of Nothnagel's *Specielle Pathologie und Therapie* (1896).

**CHULALONGKORN, SOMDETH PHRA PARAMINDA MAHA.** King of Siam, died October 23, 1910. He was born in Bangkok in 1853, the son of King Paraminda Maha Mongkout. He succeeded to the throne on the death of his father in 1868. He was the ninth son and was elected to the throne by the Senabodee. As he was only fifteen years of age at the time the head of the Senabodee acted as Regent until 1873, when the King assumed his full powers. Before he ascended the throne he became proficient in the several languages spoken in India and in the Malay Peninsula, and in French and English. He was the most progressive king that had hitherto occupied the throne of Siam. As soon as the Regency was abolished and he was crowned, he began making reforms, first by cutting down the ceremony with which the approach to the King had been surrounded and then by modernizing the government. He practically abolished slavery, reduced internal taxes, opened canals and roads, established postal telegraph and telephone services, caused the erection of lighthouses along the coast of his country, surveyed and sounded navigable streams, established a new code of laws, improved the public educational systems, proclaimed religious

freedom, built hospitals and an art museum and rebuilt temples and by bringing more Europeans into the national service, strove to modernize the governmental operations in every way. During General Grant's tour of the world he visited the King of Siam at the latter's expressed desire and was entertained by him for six days. See SIAM.

**CHURCHES OF GOD.** A religious denomination, whose doctrines agree in general with those held by the Baptists. It was founded in 1830 as the result of the preaching of John Winebrenner, a German Reformed pastor at Harrisburg, Pa. The name "Winebrennerians" is sometimes given to the denomination. In 1910 there were 41,475 communicants and 595 churches, with 509 ministers. The churches are divided into 17 annual elderships, delegates from which constitute the general eldership of the Churches of God which meets every four years. The denomination is strongest in Pennsylvania, West Virginia and the States of the central West. A college is maintained at Findlay, O., and a collegiate institute at Fort Scott, Kansas. Missionary work is carried on in India. The denomination has a publishing house and book store at Harrisburg, Pa.

**CITY PLANNING.** See ARCHITECTURE.

**CIVIC ASSOCIATION. AMERICAN.** An organization formed in 1904 from the combination of two national organizations which had previously existed, with similar purposes. The Association devotes its efforts to the solution of the physical as distinguished from the political problems of the communities and particularly to the individual development of the ideals of beauty and efficiency of home, town, State and national life. Its activities are conducted through various departments and included in its work have been efforts to make living conditions clean, healthful and attractive, to extend the making of public parks, to promote the opening of gardens and playgrounds for children and recreation centres for adults, to abate public nuisances, including bill boards, objectionable signs, needless noises and unpleasant and wasteful smoking factory chimneys; to preserve great scenic wonders, such as Niagara Falls and the White Mountains, from commercial spoliation.

During 1910 the Association advised and supervised many civic improvements in communities both on the Pacific and Atlantic coasts and from the northern to the southern boundaries of the United States. The Association holds annual meetings. The meeting in 1910 was held in Washington, December 14, 15 and 16. It numbered among its delegates representatives from local civic associations from every section of the country. The principal theme of the convention was the subject of planning beautiful cities and many important papers were read dealing with this subject. The officers in 1910 were as follows: President, J. Horace McFarland; first Vice-President, Clinton Rogers Woodruff; treasurer, William B. Howland; secretary, Richard B. Watrous; vice-presidents, James R. Garfield, Rev. John Wesley Hill, W. W. Hannan, George W. Marston, and Mrs. Edward W. Biddle. The headquarters of the Association are in Washington.

**CIVIC FEDERATION, NATIONAL.** An organization founded in Chicago in 1900 "to organize the best brains of the nation in an educational movement toward the solution of some of the great problems relating to social and industrial progress; to provide for the study and discussion of questions of national import; to do this under the crystallization of the most enlightened public opinion, and when desirable, to form legislation in accordance therewith." The work of the organization is done with various bureaus. Among these the most important are those having to do with compensation, industrial conciliation and welfare. The compensation bureau during 1910 gave serious attention to the question of compensation for industrial accidents. A bill was drawn which received the favorable criticism and endorsement of many large industrial employers and many leaders of organized labor. This bill is based upon the exercise of the police power of the State and is thought to be a reasonable step at the present time in providing for workmen injured under the conditions prevailing in modern industry. See EMPLOYERS' LIABILITY.

The Departments of Conciliation and Trade Agreements did much during the year to avoid breaches of industrial peace. The Department received the thanks of the Mayor of New York City for its good offices in connection with the settlement of the Express strike. See STRIKES AND LOCKOUTS. Many trade agreements were entered into during 1910 in many new industries and between many new employers and their employees. This policy, which seems to have been interrupted by the panic of 1907, acquired new vigor in 1910.

The Federation devoted during the year a large consideration to the subject of reform in legal procedure. A committee was appointed on this subject, which is coöperating with a similar committee of the American Bar Association. This joint committee is working to secure, through congressional action, a simple practice act for the Federal courts which can be used as a basis for a reformed practice act in the several States. The bill was submitted to a judiciary committee of both the House of Representatives and the Senate.

The past year witnessed a great extension of the influence of the National Civic Federation through the organization of State Councils in the following States: California, Connecticut, Florida, Georgia, Illinois, Indiana, Kansas, Ken-

tucky, Maine, Massachusetts, Missouri, Nebraska, Nevada, New Hampshire, New York, North Carolina, Ohio, Oklahoma, Pennsylvania, Rhode Island, Tennessee, Vermont, Virginia, Washington, West Virginia, Wisconsin, District of Columbia. These Councils are to act in coöperation with the Executive Committee of the National Civic Federation. It is expected that they will render effective service in many lines and especially in securing legislation, each one in its own State, upon reasonably uniform lines in matters affecting the common life of the people of the various States.

The Welfare Department of the Federation consists of about 500 employers and many public officials. Its purpose is to interest employers in improving the conditions under which employes in all industrial occupations work and live. It deals with such subjects as sanitary work places, including systems for providing pure drinking water, better ventilation, devices for exhausting dust and removing gas, adequate lighting, safeguards against industrial accidents, emergency hospitals, locker rooms, and where women are employed, seats; emphasizes the importance of recreation, education and good housing, and of the establishment of provident funds. During 1910 over 100 employers solicited this department for advice. One company having 10,000 employes asked to have its factories inspected. An association of employers involving nineteen concerns with 70,000 employes has asked for an investigation and recommendations for improving the conditions affecting their employes.

The Woman's Welfare Department of the Federation is composed largely of women who are themselves stockholders, or who, through family relationships are financially interested in industrial organizations and who are interested in the welfare of workers in enterprises from which they draw their incomes. Especially good work was done by this Department in New York, New Jersey, North Carolina and Washington during 1910. The last named section, being at the national capital, successfully used its influence in a number of cases in improving the conditions affecting the government employes. The New York and New Jersey section conducted a valuable investigation into the subject of mercurial poisoning from which good results are anticipated. At Spray, N. C., work was done among the 10,000 operatives in the cotton mills of that city. The officers in 1910 were as follows: President, Seth Low; Vice-Presidents, Samuel Gompers, Nahum J. Bachelder, Ellison A. Smyth, Benjamin I. Wheeler; Treasurer, Isaac N. Seligman; Chairman of the Executive Council, Ralph M. Easley.

**CIVIC IMPROVEMENTS.** See ARCHITECTURE.

**CIVIL ENGINEERING.** So special and diversified are the large projects that fall under this head in progress in 1910 that it is impossible to group them together. Accordingly the reader is referred to AQUEDUCTS; BRIDGES; CANALS; CHICAGO DRAINAGE CANAL; CONCRETE DAMS; DOCKS AND HARBORS; DREDGING; FIRE PROTECTION; FOUNDATIONS; GABBAGE AND REFUSE DISPOSAL; LIGHTHOUSES; RAILROADS; ROADS AND PAVEMENTS; SANITARY ENGINEERING; WATER PURIFICATION; WATER SUPPLY; WATER WORKS.

**CIVIL SERVICE COMMISSION.** See CIVIL SERVICE.

**CIVIL SERVICE. FEDERAL CIVIL SERVICE.** At the close of 1910 nearly 300,000 employees of the government were in the classified civil service. Of these about 226,000 were in the competitive classes and were appointed for merit; about 68,000 were in the classified service having been appointed on exceptional terms with exemption from examination or without competitive examination. The unclassified service numbers about 61,000 persons, of whom about 50,000 are unskilled laborers and 2600 were census appointees.

The total number of positions in the civil service on June 30, 1909, was 342,159. Of these 9105 were presidential appointees and 333,054 belonged to other classes. Of the total number, 30,298 were in Washington and 311,861 were in the employ of the government outside of Washington.

President Taft has at all times shown himself to be in favor of the extension of the civil service system. On September 30, 1910, he issued an executive order to place in the competitive classified service the assistant postmasters in post-offices of the first and second classes, and clerks in the non free delivery post-offices of the same classes heretofore exempt. This classification, which became effective on December 1, 1910, includes 2237 assistant postmasters and 1386 clerks, or 3623 in all. In a speech before the League of Republican Clubs in New York City on October 1, 1910, he recommended the extension of the merit system to postmasters of the first, second and third classes, collectors of internal revenue, collectors of customs, surveyors of customs and appraisers. He declared that all of those offices ought unquestionably to be in the classified service. He repeated this recommendation in his message to Congress in December, 1910, and asked Congress immediately to enact a law providing that the executive shall have the power to include in the classified service all local officers outside of Washington whose appointments now require confirmation by the Senate. He also recommended a pension scheme for superannuated employees.

The extension of the merit system to the consular and diplomatic services, which took place in 1908-9, has given excellent results. A large number of the positions are filled either as the result of examination or by promotion within the service. A merit system has been recommended for army promotions by the Secretary of War. The 61st Congress had before it two civil service bills both recommended by the President, one to enact into a law executive orders applying limited competition to the diplomatic and consular services, and the other to regrade salaries throughout the entire civil service to correspond with the duties performed. An appropriation of \$100,000 was made for investigations into the methods of the departments at Washington.

**STATE CIVIL SERVICE.** Important extensions of the civil service system have been made in a number of the States. In Illinois it has been applied to the State Board of Control and to a number of cities. In Massachusetts it has been extended to penal institutions and in Boston by city ordinance, consolidating several departments, to some important positions formerly exempt. In Michigan, Detroit by a popular vote of 3 to 1 voted to amend its charter by including the provisions of the merit system. In Missouri the competitive civil service methods

have been applied to high municipal positions in Kansas City, and in Pittsburg, Pa., medical inspectors are selected through competition. In New York State the transfer tax appraisers, stock transfer clerks, and the court and trust fund examiners have been placed in the competitive class. In Illinois in the election of November on the question put upon the ballots "Shall the next General Assembly enact a comprehensive and adequate civil service reform law" the popular vote was  $3\frac{1}{2}$  to 1 in its favor. In addition to this, a large majority of both House and Senate as elected is pledged to abide by this vote and to work and vote accordingly. A new municipal code providing the civil service reform system for all cities went into effect on January 1, 1911, in Ohio.

**MERIT SYSTEM IN HIGHER MUNICIPAL OFFICES.** The question of the application of the merit system to the higher municipal offices has been urged by the National Civil Service Reform League for several years, and in 1906 a committee appointed to consider the subject submitted its first report. At that time public interest had not sufficiently advanced to justify any recommendations, but in the years following the principle had become so well established that President Taft in his message in December, 1910, made the following statement: "Officers responsible for the policy of the administration and their immediate assistants and deputies should not be included within the classified service; but in my judgment public opinion has advanced to a point where it would support a bill providing a secure tenure during efficiency for all purely administrative officials."

The nearest approach to the application of the merit system to high municipal offices is found in the provisions of the new charter of the city of Boston. This provides that the mayor shall appoint as heads of departments without regard to party affiliation persons recognized as experts or as especially fitted for the work by education, training or experience. The charter requires that the fitness of the nominee shall be approved by the Civil Service Commission. The merit system has been applied to some extent also in the new Kansas City charter. In that city the city engineer, superintendent of street cleaning, chief superintendent of water works, assessor and collector of water rates, and assistant city counsellors are selected through competition. In Chicago outside of the heads of departments there are few high grade positions which are not competitively classified. In New York the chief engineer of the board of estimate and apportionment, the chief of the fire department and superintendents of hospitals are competitive.

**NATIONAL CIVIL SERVICE REFORM LEAGUE.** An organization founded in 1881 as a federation of the various local civil service reform associations, the first of which was founded in 1877 in New York. The first president of the League was George William Curtis. Since its organization, the extension of civil service reform in the Federal, State and municipal governments has been constant. Largely due to its efforts the merit system has been applied to the consular and diplomatic services, to fourth-class postmasters, to several States and to many cities. The League has devoted special efforts to the prevention of political activity among Federal office holders. It holds annual meetings in different cities of the United States. The meeting for

1910 was held at Baltimore, December 16 and 17. The president of the League, Charles W. Eliot, made an address outlining the work of the League during the year. Among the recommendations made at this meeting were the following: The extension by executive order of the competitive examination to fourth-class postmasters; the extension of the merit system to the municipal service of the District of Columbia; legislation giving the appointment of first, second and third-class postmasters to the President alone or to the Postmaster General without confirmation by the Senate; legislation which in accordance with the recommendations of the President shall bring within the merit system the appointment and promotion of all Federal employees, excepting only officers responsible for the policy of the administration and their immediate personal assistants or deputies; the extension of the merit system of appointments and promotion to employees of legislative assemblies, National, State and municipal; the effective regulation of political activity of all non-political officers and employees; and the enactment of a comprehensive civil service law for Porto Rico. The officers of the League are; President, Charles W. Eliot; Vice-Presidents, Edwin A. Alderman, Joseph H. Choate, Harry A. Garfield, George Gray, Arthur T. Hadley, Seth Low, Franklin MacVeagh, George A. Pope, P. J. Ryan, D. D., Moorfield Storey, Thomas N. Strong, Herbert Welsh and Woodrow Wilson; Secretary, Elliot H. Goodwin; Treasurer, A. S. Frissell.

**CLEMENT, CLAY.** See NECROLOGY.

**CLARK, CHARLES CAMERON.** An American railroad official, died May 25, 1910. He was born in Canandaigua, N. Y., in 1822. He graduated from Hobart College and entered the service of the Hudson River Railroad as an auditor. He later became treasurer of this road and held this position until 1871, when he was elected 1st Vice President. The road had at this time been consolidated with the New York Central. He took an interest in art and scientific subjects and was a director of the Metropolitan Museum of Art, American Museum of Natural History and the American Geographical Society.

**CLARK, EDWARD LORD.** An American Congregational clergyman, died February 5, 1910. He was born at Nashua, N. H., in 1838 and graduated from Brown University in 1858. He studied at the Andover Theological Seminary, graduating in 1863. Two years previously he had been ordained to the Congregational ministry. In 1861-2 he was chaplain of the Twelfth Massachusetts Volunteers and from 1863 to 1866 was pastor of the First Church of North Bridgewater, Massachusetts. From 1867 to 1873 he was pastor at New Haven, Conn. He was pastor of the Presbyterian Church of the Puritans, New York City, from 1873 to 1893 and of the Central Congregational Church of Boston from 1893 to 1902. He travelled extensively, and published *Daleth-Egypt*, illustrated (1863) and *Israel in Egypt* (1873).

**CLARK, GALEN.** An American naturalist, died March 24, 1910. He was born in Dublin, N. H., in 1814. In 1853 he went to California by the Panama route. For a time he worked in the placer mines of the State, and while engaged on the South Fork of the Mercer River at a

point not far from the Yosemite Valley, he became interested in that wonderful valley, and as early as 1857 began guiding parties of tourists there, spending his winters in a cabin which he built at a point now known as Wawona. In 1864 when tourist travel had considerably increased, he opened a small hotel at this place. When the California legislature took its first action for the care and preservation of the Yosemite Valley, Clark was one of the original board of Commissioners created under the law of 1865. He was also made guardian of the park at that time. He was afterwards succeeded by another, but about twenty years previous to his death he was reappointed. He then made the park his permanent home. In 1857, while on a hunting trip, he discovered the great redwood growth at Mariposa. Soon after that he devoted much of his time to exploring the upper heights of the Sierra Nevada Mountains and made known to the world the beauties of that region. He was an intimate friend of John Burroughs, John Muir, Joseph Le Conte and many other eminent scientists. He was regarded by them as a high authority on the geology and natural wonders of the Sierra Nevada Mountains.

**CLARK, JOHN WILLIS.** An English zoölogist, registrar of Cambridge University until September, 1910, died October 10, 1910. He was born in 1833 and was educated at Eton and at Trinity College, Cambridge. After taking his degree he travelled extensively on the Continent. He lived at Cambridge for more than seventy-five years and was one of the most conspicuous figures in the university community. For twenty-five years he was superintendent of the Museum of Zoölogy during which time he did much for the promotion of the study of natural sciences at Cambridge. He made many contributions to zoölogy. His special interest lay in marine mammals and he published several scientific papers on the anatomy and habits of the narwhal, and on the dolphins and on the extinct rhytina. In addition to his work at the Museum he wrote essays on a great variety of subjects, topographical, biographical, bibliographical and antiquarian. He became registrar of the university in 1891.

**CLARKE, CRESTON.** An American actor, died March 21, 1910. He was born in Philadelphia in 1865 and received his education in London and Paris, where he accompanied his father, John Sleeper Clarke, who was also an actor. His first appearance on the stage was at the Adelphi Theatre in London, where he acted the part of Francois in *Richelieu*, in the company of his uncle, Edwin Booth. He played in London until 1886, when he joined Lester Wallack's stock company in New York and remained there until that company went out of existence, when he became a member of Augustin Daly's stock company. After one year he became head of his own company and played in many prominent parts, among them, Hamlet. At the head of his company he toured the country for the next ten years, playing a repertoire which included several of Shakespeare's plays. In 1897 he wrote a play called *The Last of His Race*. In 1906 he played the title role in *Monsieur Beaucaire*.

**CLASSICAL PHILOLOGY.** See PHILOLOGY.

**CLASSICS.** See PHILOLOGY.

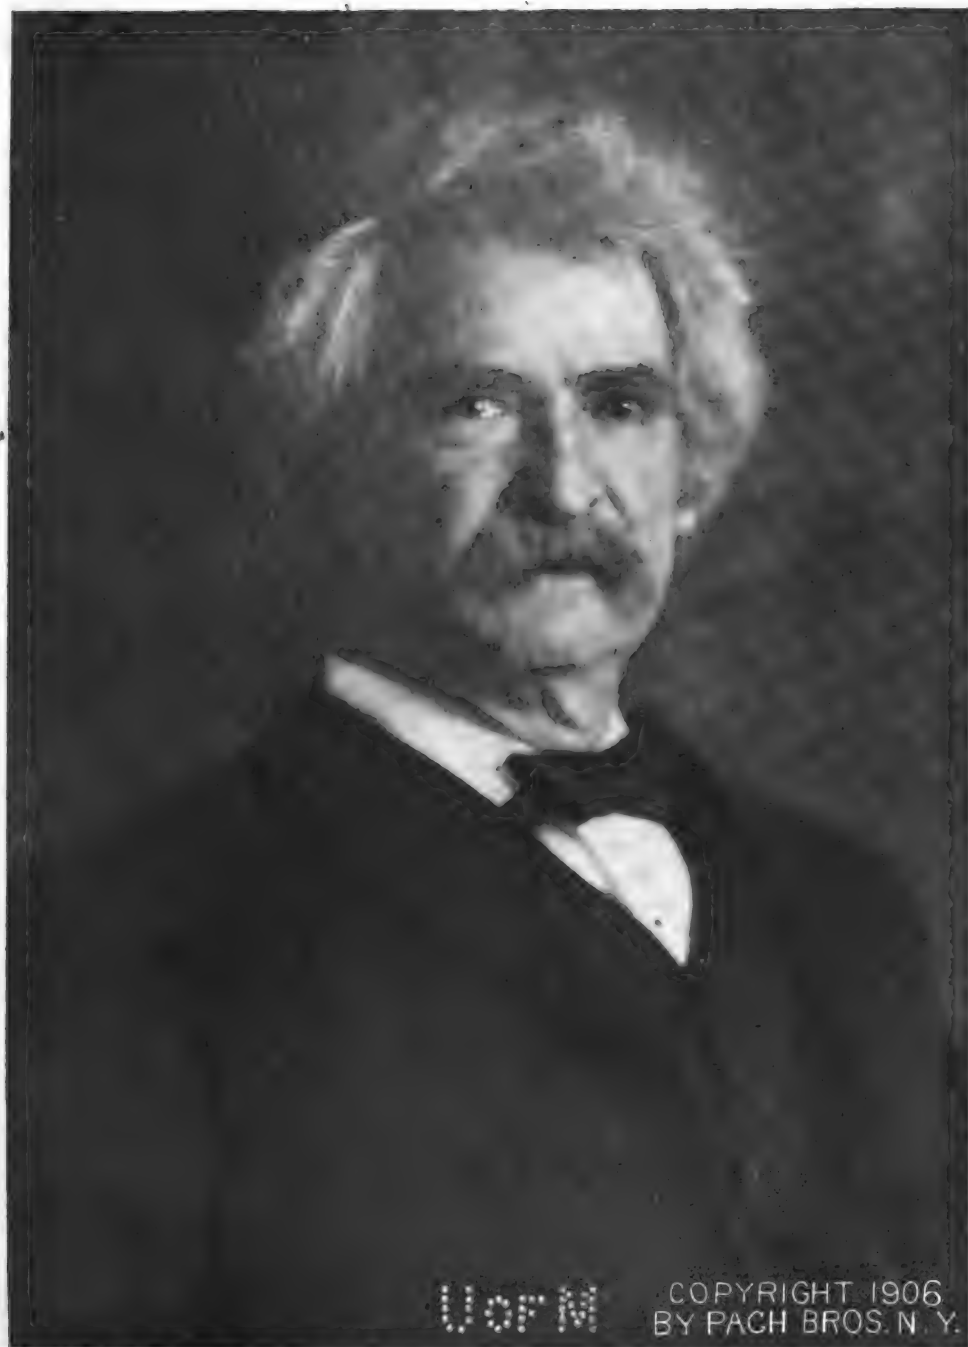

**CLAY, ALEXANDER STEPHENS.** United States Senator from Georgia, died November 13, 1910. He was born on a farm in Cobb county, Ga. in 1853 and graduated from Hiwassee College in 1875. He studied law and was admitted to the bar in 1877. He remained in active practice at Marietta, Ga., to the time of his death. From 1880 to 1882 he was a member of the city council and from 1884 to 1887 he was a member of the General Assembly. He was also a member of the Assembly in 1880-90. He served as Speaker two terms. He was elected to the State Senate and served as president of that body from 1892 to 1894. From 1894 to 1897 he was chairman of the Democratic State Executive Committee. He was elected to the United States Senate in 1897 and was re-elected in 1903 and 1909. Senator Clay was a member of the Committee on Appropriations in the Senate and of the Post Office Committee. He was one of the most prominent and influential of the Democratic senators and he took an active part in the work of the special session which passed the Payne-Aldrich tariff and in the deliberations of the second session of the 61st Congress, although for the greater part of the time he was suffering from ill health. He was one of the readiest debaters in the Senate and was often heard on public questions.

**CLAY, A. T.** See LITERATURE, ENGLISH AND AMERICAN, *History*.

**CLEARINGS, BANK.** See BANKS.

**CLEMENS, SAMUEL LANGHORNE** (Mark Twain). The most famous of American humorists, died April 21, 1910. He was born in Florida, Monroe county, Missouri, a small town about 100 miles northwest of St. Louis, on November 30, 1835. His father was a man of some education and social importance, according to the standards of the frontier in the early part of the 19th century. Five years before the birth of his son he had removed to Florida, believing that the site could be made of great commercial importance. He failed, however, to induce Congress or individuals to improve the river, a measure which was necessary to make it navigable up to that point, and in 1838 removed to Hannibal, Mo., a town on the Mississippi about 125 miles above St. Louis. There young Clemens learned to know and love the river which so frequently and prominently appeared in his stories. He went to the village school in Hannibal and in vacation explored the glens, cliffs and marshy shores of the Mississippi. These scenes he afterwards made memorable in *Tom Sawyer* and *Huckleberry Finn*. He had no schooling beyond the most rudimentary branches, and at 12 years of age he went into the composing room of the *Hannibal Weekly* to learn the printer's trade. He soon became an expert compositor. In the absence of the editor he was accustomed to insert surreptitiously some of his own writings, among them verses. These on examination are found to have been of no particular merit. His desire for change led him to leave Hannibal and before he was 16 years of age he had worked in the composing rooms of newspapers in St. Louis, Cincinnati, Philadelphia and New York. The river, however, fascinated him, and in 1851 he returned to Hannibal, determined to become a pilot. For this it was necessary to take a course of instruction under a master pilot, and this required \$500 as the price of his tuition. The young man did not have this amount

available and he worked for several years to accumulate it. In 1857 he was able to begin the course of instruction and two years later he had a pilot's license. He came to be considered one of the most skillful pilots on the river. In 1861 he enlisted in the Confederate army with General Sterling Price, but after a few months returned to St. Louis and joined his brother, Orrin, who had been appointed Secretary of the Territory of Nevada, and he accompanied the latter as his clerk, to Carson City. There were at that time gold discoveries in a camp called Aurora, and Mr. Clemens went to that place. He made no discoveries of importance in mining, but he made many acquaintances with original characters who frequented the gold diggings, and he accumulated much material which he afterwards used in *Roughing It*. After a year in this camp he went to Virginia City and took a place on the *Enterprise*, a morning daily paper. There were on the staff of this journal two men who notably affected Mr. Clemens's later career and work. One was a scholar and writer of some talent, who contributed to newspapers and periodicals under the name of Dan De Quille. He soon noted in Mr. Clemens's work a rare humorous vein and urged him to develop it. Dennis McCarthy, a San Francisco newspaper man, was also a member of the *Enterprise* staff, and he, too, encouraged Mr. Clemens to write in his original vein. Soon signed articles appeared in the *Enterprise* over the name "Mark Twain," a name derived from calls used in taking soundings on the Mississippi River. It had previously been taken as a pen-name by Captain Isaiah Sellers in the New Orleans *Picayune*. These stories soon attracted attention and in 1865 Clemens went to San Francisco and joined the staff of the *Call*. Here he remained for only six months and then went to a mining camp in Calaveras county. Here he found the material for stories which gave him his first fame east of the Rocky Mountains, including perhaps the most famous of all his short stories, *The Jumping Frog of Calaveras County*. In 1866 he went to the Sandwich Islands and wrote from there some sketches for the *Sacramento Union*. These sketches were used as the basis for his first lectures, delivered in San Francisco, after his return from Honolulu. In 1867 other stories, including *The Jumping Frog*, were published and Mark Twain became known in the eastern States as a writer of exaggerated humor. This reputation prompted certain newspaper editors to select him to go with a party of tourists upon a journey abroad and write letters for those papers. This trip resulted in 1869 in the publication of *Innocents Abroad*, which was an extended revision of the letters. This book brought the writer instant fame in the United States and most of the countries of Europe. Shortly after his return he became editor of the *Buffalo Express*, but remained in Buffalo only two years. During his stay in that city he married Miss Olivia Langdon, whose acquaintance he had made on the ocean voyage. He then removed to Hartford, Conn., and at once began to work with the material which he had accumulated in the West. In 1872 he published *Roughing It*, which established his reputation as a story writer and humorist, and his work was urgently demanded by editors and publishers on both sides of the Atlantic. He contributed frequently to the magazines and wrote, in the fol-

**SAMUEL LANGHORNE CLEMENS**  
("MARK TWAIN")

1861

lowing year, in collaboration with Charles Dudley Warner, *The Gilded Age*, which was soon successfully dramatized. The next book which came from his pen was the one which many American and nearly all English critics consider his best work of fiction, *The Adventures of Tom Sawyer* (1876). In 1880 he made a second trip to Europe, which furnished material for *A Tramp Abroad*. This was followed by *The Stolen White Elephant* (1882); *The Prince and the Pauper*, a historical romance (1882); and *Life on the Mississippi* (1883). In 1884 Mr. Clemens invested largely in the publishing enterprise of the Charles L. Webster Company, which had contracted to pay Mrs. U. S. Grant \$500,000 for the copyright of General Grant's autobiography. This firm, ten years later, failed, with large liabilities. Although Mr. Clemens had no personal responsibility for these debts, he determined to defray them, and although his health was far from good, he started on a lecture tour of the world. This was a great success both financially and otherwise. The author was received everywhere with high social, and, sometimes, with civic honors, and the profits of the tour enabled him to pay the debts of the publishing firm with a considerable remainder for himself. For ten years after 1890 Mr. Clemens lived chiefly in Europe. During this period he published *A Connecticut Yankee at King Arthur's Court* (1889); *An American Claimant* (1892); *Merry Tales* (1892); *The \$1,000,000 Bank Note* (1893); *Pudd'nhead Wilson* (1894); *Tom Sawyer Abroad* (1894); *Personal Recollections of Joan of Arc* (1896); *More Tramps Abroad* (1897); *Following the Equator* (1897); and *The Man that Corrupted Hadleyburg* (1900). On his return to the United States he lived for a short time in New York City and then had built for him in 1908 a beautiful villa in Redding, Conn. He was a prominent figure in the social and literary life of New York during the period from 1904 to 1908. During this time he was at work on an autobiography which he announced should not be published in full until 100 years after his death. Some extracts, however, were printed in the *North American Review* and other periodicals. He suffered great bereavement in the loss of his wife in 1904. His daughter, Susan Clemens, died in 1906, and another daughter, Jean, in 1909. One daughter, who in 1909 married Ossip Gabrilowitsch, the famous pianist, alone of his immediate family, survived him at his death. Although popularly known as a humorist, Mr. Clemens had a thoroughly serious side to his character as was shown in later years by his public discussions and articles or speeches on various questions that had aroused his sympathy or indignation. But his best and perhaps his most prominent work was done as a picaresque novelist in *The Adventures of Tom Sawyer* and *The Adventures of Huckleberry Finn*. It is said, however, that he considered his best work *The Personal Recollections of Joan of Arc*, which was a historical novel. In addition to the works mentioned above, he wrote *A Double-Barreled Detective Story*, published in 1902; *A Don's Tale* (1903); *Ere's Diary* (1905); *The Horse's Tale* (1906); *The \$30,000 Bequest* (1906); *Christian Science* (1907) and *Who Was Shakespeare?* (1909). Mr. Clemens received many honors from universities in the United States and abroad. He received the degree of L. H. D. from Yale University in 1901,

L. L. D. from the University of Missouri in 1902, and Litt. D. from Oxford University in 1907. He was, without question, the most popular writer in America at the time of his death and it may be doubted if any writer in the world had more popularity or was more widely read than he.

**COAL.** The statistics of coal production as collected jointly by the United States Geological Survey and the Bureau of the Census show that in 1909 the output amounted to 459,209,073 short tons. Compared with the record for 1908, when the production amounted to 415,842,698 short tons, the record for 1909 shows an increase of 44,039,650 short tons, or 10 per cent. All of the gain was in the production of bituminous coal, which increased from 332,573,994 short tons in 1908 to 378,551,024 short tons in 1909—a gain of 45,977,080 short tons. The production of anthracite in Pennsylvania decreased from 74,347,102 long tons (equivalent to 83,268,754 short tons) in 1908 to 72,015,222 long tons (equivalent to 80,658,049 short tons) in 1909.

Pennsylvania made the largest increase in the production of bituminous coal, showing a gain of 20,666,288 short tons, from 117,179,527 short tons in 1908 to 137,845,815 tons in 1909. West Virginia for the second time in its history exceeded Illinois, and became the second State in the production of coal, the former having an output in 1909 of 51,446,010 short tons, and the latter an output of 50,970,364 short tons. West Virginia's production increased 9,548,167 short tons over 1908. The output of Illinois, which stood third in rank, increased only 3,310,674. Ohio retained its position as fourth in rank with a production in 1909 of 27,919,891 short tons, against 26,270,639 in 1908. Indiana, which in 1908 supplanted Alabama as fifth in rank, strengthened its position in 1909 by an increase of 2,566,809 tons, from 12,314,890 tons in 1908 to 14,881,699 tons in 1909, while Alabama gained 2,099,317 tons, from 11,604,593 tons to 13,703,910 tons. Other significant increases were in Colorado, 1,087,773 tons; Wyoming, 890,995 tons; Kansas, 734,270 tons; Montana, 640,082 tons; Iowa, 594,052 tons, and Washington, 551,463 tons. Georgia, Idaho, Maryland, Michigan, Missouri, and Texas showed a smaller production in 1909 than in 1908, the total decreases amounting to about 750,000 tons.

The table on next page shows the production in 1908 and 1909, by States, with comparisons. The figures for 1909 are subject to slight modifications but are substantially complete.

According to reports received by the United States Geological Survey from coal-mine operators and others familiar with the industry, the production of coal in the United States during 1910 was between 475,000,000 and 485,000,000 short tons, a considerable increase from the output of 459,715,704 short tons in 1909 and approximately within 1 per cent. of the maxi-

mum previous record of 480,363,424 tons, produced in 1907.

# PRODUCTION OF COAL, BY STATES, IN SHORT TONS

State or Territory.	1908.	1909.	Increase (†) or decrease (-), 1909.
Alabama	11,604,593	13,703,910	† 2,099,317
Arkansas	2,078,357	2,379,100	† 300,743
California and Alaska	21,862	48,636	† 26,774
Colorado	9,634,973	10,722,746	† 1,087,773
Georgia	264,822	211,196	- 53,626
Idaho	5,429	4,553	- 876
Illinois	47,659,690	50,970,364	† 3,310,674
Indiana	12,314,890	14,881,699	† 2,566,809
Iowa	7,161,310	7,755,362	† 594,052
Kansas	6,245,508	6,979,778	† 734,270
Kentucky	10,246,553	10,648,981	† 402,428
Maryland	4,377,093	4,037,343	- 339,750
Massachusetts	50	0	- 50
Michigan	1,835,019	1,783,692	- 51,327
Missouri	3,317,305	3,096,785	- 220,520
Montana	1,920,190	2,560,272	† 640,082
New Mexico	2,467,937	2,808,325	† 340,388
North Dakota	320,742	404,496	† 83,754
Ohio	26,270,839	27,919,891	† 1,649,052
Oklahoma	2,948,116	3,116,500	† 168,384
Oregon	86,259	90,228	† 3,969
Pennsylvania	117,179,527	137,845,815	† 20,666,288
Tennessee	6,199,171	6,328,073	† 128,902
Texas	1,895,377	1,824,440	- 70,937
Utah	1,846,792	2,269,481	† 422,689
Virginia	4,259,042	4,756,045	† 497,003
Washington	3,024,943	3,576,406	† 551,463
West Virginia	41,897,843	51,446,010	† 9,548,167
Wyoming	5,489,902	6,380,897	† 890,995
Total bituminous	332,573,944	378,551,024	† 45,977,080
Pennsylvania anthracite	83,268,754	80,658,049	- 2,610,705
Grand total	415,842,698	459,209,073	† 44,039,650

The most important factor influencing the coal-mining industry in 1910 was the prolonged strike in Illinois and the Southwestern States. This strike or suspension, which started on April 1 pending an adjustment of the wage scale, was not finally settled until September 15, and after that date much time was lost in putting the mines into condition for operation, so that the period of idleness in the mines affected was fully six months. The settlement was a practical surrender of the operators to the demands of the miners, with an increase of 5.55 per cent in wages. A similar increase was granted in a number of other States, either before the strike was called or during the suspension or subsequent to it. During the idleness many of the miners who were on strike in Illinois obtained employment in the mines of competitive States and helped to increase the output of those States, which offset the shortage in the States affected.

Notable increases in production were made in the western counties of Kentucky, in western Pennsylvania, and in Ohio, West Virginia, Alabama, Colorado, New Mexico, and Montana. The States whose production was reduced by the strike were Illinois, Kansas, Missouri, Arkansas and Oklahoma. It was claimed by the miners' organization that on June 1, 1910, 70,000 miners were idle in Illinois, and 35,000 in the Southwest—that is, in Kansas, Missouri, Arkansas, Oklahoma and Texas. About the middle of May the operators of two important districts in Illinois seceded from the Illinois Coal Operators' Association, which was in contest with the miners' union, accepted the miners' terms, and went to work. Other mines which were not

represented in the association were also operated during the strike, so that from 25 to 30 per cent. of the normal output of the State was being produced at the time the strike was ended, and this continuous production was a potent factor in bringing the operators to terms with the miners.

Of the total production in 1910 the anthracite mines of Pennsylvania contributed nearly 83,000,000 short tons and the bituminous mines between 390,000,000 and 400,000,000 tons.

The coal production in 1910 as gathered from various sources by the *Engineering and Mining Journal* is shown in the accompanying table:

# PRODUCTION OF COAL IN THE UNITED STATES

States.	1910 a Short Tons.
<b>Bituminous:</b>	
Alabama	15,060,000
Arkansas	1,200,000
California and Idaho	20,000
Colorado	12,089,447
Georgia	280,000
Illinois	50,000,000
Indiana	15,692,089
Iowa	7,660,000
Kansas	5,750,000
Kentucky	13,723,235
Maryland	4,800,000
Michigan	1,820,000
Missouri	3,000,000
Montana	3,050,000
New Mexico	3,618,665
North Dakota	390,000
Ohio	32,500,000
Oklahoma	3,400,000
Oregon	80,000
Pennsylvania	144,365,816
Tennessee	7,009,000
Utah	2,526,093
Texas	4,050,100
Virginia	4,980,000
Washington	3,510,207
West Virginia	59,990,300
Wyoming	5,460,200
Alaska and Nevada	10,000
Total bituminous	403,533,152
<b>Anthracite</b>	
Colorado	70,586
New Mexico	8,000
Pennsylvania	80,310,720
Total anthracite	80,389,306
Grand total	483,922,458

(a) For the fiscal year ending June 30.

**COAL MINING ACCIDENTS.** The United States Geological Survey gathered in 1910 statistics of accidents in the coal mines of the United States during 1909, with a review of the statistics of coal mining accidents since 1884. The fatal accidents in 1909 numbered 2412 as compared with 2450 in 1908. In 1909 there were 7979 persons injured in the coal mines of the United States as compared with 6772 in 1908. There was therefore a decrease of fatal accidents, while the non-fatal accidents increased in number. The largest number of men killed in 1909 was in the mines of Pennsylvania, where 567 persons perished in the anthracite mines and 506 in the bituminous mines. West Virginia was second in the number of fatalities with 364 men killed and 1032 injured. Then followed in the order named, Georgia, Alabama and North Dakota with these numbers respectively, 364, 213, and 115 killed.

As to the causes of these fatalities the opinion is prevalent that the dangers from explosions and from fire and suffocation are the greatest to which workers in the coal mines are exposed. Such, however, is not the case. While fires

and explosions are bound to occur so long as coal is mined, for the industry as a whole the number of victims of fire and explosion was comparatively few. The greatest danger to which the miner is exposed is that from falls of roof and coal, and this danger is materially increased from the weakening of the roof and the shattering of the coal left as supporting pillars when excessive charges of powder are used. In 1909 out of the 2412 killed, 1191 or 45 per cent. were victims of roof or coal, and of the 7979 non-fatally injured, 3280 or 40 per cent. were due to these causes. Only 14 per cent. of the deaths and less than 5 per cent. of the injuries were due to explosions of dust or gas or combinations of the two. As indicating the relatively slight fatal character of explosions as compared with other causes of coal mining accidents, it is to be noted that in the explosions that occurred in 1909, 341 were killed and 331 injured. In the accidents due to windy or blown out shots and to explosions of powder or dynamite, 108 were killed and 217 injured. Falls of coal and roof killed 1191 and injured 3280, while in the accidents due to miscellaneous causes 759 were killed and 3875 were injured.

The most serious disaster which occurred during the calendar year 1909 was a fire at the Cherry Mine of the St. Paul Coal Company at Cherry, Illinois. In this disaster 393 men were burned or suffocated. In an explosion at the Lick Branch Colliery of the Pocahontas Consolidated Collieries Company near Bluefield, W. Va., on January 12, 1909, 69 men were killed and one was injured.

To the close of 1909, so far as statistics are available, 30,276 men were killed in the coal mines of the States and 72,585 were injured. Of those killed the deaths of 14,510 were due to falls of roof and coal and 9732 to other causes.

The question of the prevention of coal mine accidents was the principal matter of discussion at all meetings of coal miners in 1910. The Federal Bureau of Mines established in 1910 has special charge of matters relating to the prevention of accidents in mines, and it is anticipated that great good will result from the investigations and recommendations of the Bureau. During the year use was made of rescue cars as an adjunct of the work of the Bureau, and engineers and men in charge administered relief at many mine disasters during the year. The use of acetylene mine lamps became more common than in years previous, and with good results. See STRIKES AND LOCKOUTS.

**COAST ARTILLERY.** See MILITARY PROGRESS.

**COASTWISE TRADE.** See UNITED STATES, Commerce.

**COATES, HENRY TROTH.** An American publisher, died January 22, 1910. He was born in Philadelphia in 1843 and graduated from Haverford College in 1862. He engaged in the business of publishing in 1868 and continued as a member of the firms of Porter & Coates, and Henry T. Coates & Co. until the time of his death. He edited many works, among which are the *Fireside Encyclopedia of Poetry*; *Children's Book of Poetry*, and *The Comprehensive Speaker*. He was the author of a *Short History of the American Trotting and Pacing Horse*.

**COBALT.** See ATOMIC WEIGHTS.

**COBB, HENRY NITCHE.** See NECROLOGY.

**COCAINE HABIT.** No diminution was ap-

parent in the prevalence of the cocaine habit during 1910, although many "crusades" against its use were carried out, and many offenders against the illegal vending of cocaine were fined or jailed. An alarming state of affairs was discovered in Philadelphia, through the investigations of the State Pharmaceutical Board, as a result of which more than a score of druggists were arrested and held in bonds, and the United States government inspector of drugs at the port of Philadelphia was also apprehended. It was learned that the drug was not only being distributed to cocaine habitués, but even sold to school children. In examining the accounts of wholesale dealers as to the amount of cocaine sold, it was found that one had disposed of 1900 ounces of the drug in one month, while the sales of another dealer amounted to 1400 ounces. At this rate, the yearly sales would total between 15,000 and 20,000 ounces, which is a good deal more than would normally be demanded.

In St. Louis, it was reported that cocaine was being sold generally and the cocaine traffic flourished openly. In November seventeen individuals were arrested and charged with selling or using cocaine. A reporter for a local paper purchased nine packages of cocaine in the course of twenty-four hours.

Governor Hughes of New York State signed a bill providing that persons who sell or furnish cocaine or eucaine, as permitted by law on a physician's prescription, shall, at the time of the sale, give to the purchaser a certificate stating the seller's name and address, the name and address of the physician on whose prescription the drug was furnished, and the date of sale and the amount sold.

**COCHIN-CHINA.** A state of French Indo-China (q. v.) constituting in itself a separate French colony. Area, 21,988 sq. miles. Population (1901) 2,968,529, of whom 2,551,986 were natives of Cochin-China, 231,902 Cambodians, 92,075 Chinese, 4932 French, 2537 French troops, 2667 native troops. Saigon, the capital, has about 50,870 inhabitants (5500 French); Cholon, 130,000. There are 380 schools, with 19,000 pupils. Buddhists, 1,688,270; Roman Catholics, 73,234. The delta regions are very fertile; rice is the principal crop, covering about 1,358,706 acres and yielding in 1909 1,500,000 tons. The fisheries products are valued at 2,800,000 francs yearly. Saigon has the largest trade in French Indo-China. Imports and exports are included with those of French Indo-China, as are also financial statistics. Lieutenant-governor (1910), M. Rodier.

**COCHRAN, MORRIS J.** See NECROLOGY.

**COCOS, OR KEELING ISLANDS.** A group of about 20 small coral islands administratively attached to the Straits Settlements and annexed to Singapore (they lie 1200 miles southwest of Singapore). Area, 9 sq. miles; population (1904) 640.

**CO-EDUCATION.** See EDUCATION; TUFTS COLLEGE AND UNIVERSITIES AND COLLEGES.

**COGNAC.** See LIQUORS, FERMENTED AND DISTILLED.

**COINAGE OF GOLD AND SILVER.** See UNITED STATES.

**COINS, FOREIGN, VALUE OF.** The following table gives the value of foreign coins in United States currency on Dec. 31, 1910:

## VALUE OF FOREIGN COINS

Country.	Legal standard	Monetary unit.	Value in terms of U.S. money	(a) Remarks.
Argentine Republic ...	Gold .....	Peso .....	\$.965	Currency. Depreciated paper, convertible at 44 per cent of face value.
Austria-Hungary ....	Gold .....	Crown .....	.203	
Belgium .....	Gold and silver...	Franc .....	.193	Member of Latin Union; gold is the actual standard.
Bolivia .....	Gold .....	Boliviano .....	.389	12 1/2 bolivianos equal 1 pound sterling.
Brazil .....	Gold .....	Milreis .....	.546	Currency; Inconvertible paper; exchange rate, approximately, \$0.3245.
British Colonies in Australasia and Africa.	Gold .....	Pound sterling .....	4.8665	
Canada .....	Gold .....	Dollar .....	1.000	
Central Amer. States:				
Costa Rica .....	Gold .....	Colon .....	.465	
British Honduras .....	Gold .....	Dollar .....	1.000	
Guatemala .....	Silver.....	Peso .....	.403	Currency; Inconvertible paper, much depreciated and subject to wide fluctuations.
Honduras .....				
Nicaragua .....				
Salvador .....				
Chile .....	Gold .....	Peso .....	.365	Currency; Inconvertible paper; exchange rate, approximately, \$0.2189.
		Amoy .....	.661	
		Canton .....	.659	
		Chefoo .....	.632	
		Chin Kiang .....	.646	
		Fuchau .....	.612	
		Haikwan .....	.673	
		(Customs).		
		Hankow .....	.619	
China .....	Silver.....	Tael....	.641	
		Kiao-Chau .....	.655	
		Nanking .....	.620	
		Niuchwang .....	.636	
		Ningpo .....	.645	
		Peking .....	.604	
		Shanghai .....	.611	
		Swatow .....	.665	
		Takau .....	.041	
		Tientsin .....	.435	
		Hongkong .....	.435	
		British .....	.435	
		Mexican .....	.433	
Colombia.....	Gold .....	Dollar .....	1.000	Currency; Inconvertible paper; exchange rate, approximately, \$100 paper to \$1 gold.
Denmark.....	Gold .....	Crown .....	.268	
Ecuador .....	Gold .....	Sucre .....	.437	
Egypt .....	Gold .....	Pound (100 piasters)	4.943	The actual standard is the British pound sterling; which is legal tender for 97 1/2 piasters.
Finland.....	Gold .....	Mark .....	.193	
France.....	Gold and silver...	Franc .....	.193	Member of Latin Union; gold is the actual standard.
German Empire .....	Gold .....	Mark .....	.238	
Great Britain .....	Gold .....	Pound sterling .....	4.8665	
Greece .....	Gold and silver...	Drachma .....	.193	Member of Latin Union; gold is the actual standard.
Haiti .....	Gold .....	Gourde .....	.965	Currency; Inconvertible paper; exchange rate, approximately, \$0.195.
India (British).....	Gold .....	Rupee .....	.324 1/2	(15 rupees equal 1 pound sterling).
Italy .....	Gold and silver...	Lira .....	.193	Member of Latin Union; gold is actual standard.
Japan .....	Gold .....	Yen .....	.498	
Liberia .....	Gold .....	Dollar .....	1.000	Currency; Depreciated silver token-coins. Customs duties are collected in gold.
Mexico.....	Gold .....	Peso .....	.498	
Netherlands .....	Gold .....	Florin .....	.402	
Newfoundland.....	Gold .....	Dollar .....	1.014	
Norway .....	Gold .....	Crown .....	.268	
Panama.....	Gold .....	Balboa .....	1.000	
Persia .....	Gold and silver...	Kran .....	.1704	This is the value of the gold kran. Currency is silver circulating above its metallic value; exchange value of silver kran, approximately \$0.088.
Peru.....	Go'd .....	Libra .....	4.8665	
Philippine Islands .....	Gold .....	Peso .....	.500	
Portugal .....	Gold .....	Milreis .....	1.080	Currency; Inconvertible paper; exchange rate, approximately, \$1.00.
Rumania .....	Gold .....	Leu .....	.193	
Russia .....	Gold .....	Ruble .....	.515	
Santo Domingo .....	Gold .....	Dollar .....	.1000	
Servia .....	Gold .....	Dinar .....	.193	
Siam .....	Gold .....	Tical .....	.3708	
Spain .....	Gold and silver...	Peseta .....	.193	Valuation is for the gold peseta; currency is silver circulating above its metallic value; exchange value, approximately \$0.1794.
Straits Settlements ....	Gold .....	Dollar .....	.421	
Sweden .....	Gold .....	Crown .....	.268	
Switzerland .....	Gold .....	Franc .....	.193	Member of Latin Union; gold is the actual standard.
Turkey .....	Gold .....	Piaster .....	.044	
Uruguay .....	Gold .....	Peso .....	1.034	
Venezuela .....	Gold .....	Bolivar .....	.193	

a The exchange rates shown under this heading are recent quotations and given as an indication of the values of currencies which are fluctuating in their relation to the legal standard. They are not to take the place of the Consular certificates where it is available

**COKE.** The production of coke in 1910 according to the figures obtained by the *Engineering and Mining Journal* from various sources was 35,625,865 short tons as compared with the production in 1909 of 35,076,902 short tons. The production of the various States in 1909-10 is shown in the accompanying table by the same authority.

PRODUCTION OF COKE IN THE UNITED STATES

States.	1909	1910.
Alabama.....	2,521,000	3,300,000
Colorado.....	1,091,882	1,190,901
Georgia and North Carolina..	50,000	62,000
Illinois.....	425,970	390,000
Kansas.....	12,000	10,000
Kentucky.....	38,849	58,700
Missouri.....	5,000	5,000
Montana.....	42,960	58,200
New Mexico.....	430,000	510,000
Ohio.....	250,000	260,000
Oklahoma.....	38,620	30,000
Pennsylvania.....	23,098,483	22,875,000
Tennessee.....	255,900	240,000
Utah.....	346,510	146,064
Virginia.....	1,294,942	1,310,000
Washington.....	42,335	40,000
West Virginia.....	3,125,451	3,250,000
Other States (a).....	2,007,000	1,890,000
Total.....	35,076,902	35,625,865

(a) Includes output of by-product coke for Massachusetts, Maryland, Minnesota, New York, Michigan, Wisconsin.

There was a marked difference in the conditions governing the coke industry at the close of 1910 when compared with the last months of 1909. In the former period the steel business was favorable and coke prices had advanced to \$3 a ton at the ovens. Coke prices at the end of 1910 were in the neighborhood of \$2 a ton at the ovens, with a limited demand. In the latter part of 1909 the industry was greatly hampered by the lack of labor and the scarcity of water. Shipments were also handicapped by a shortage of cars for shipping. In 1910 these conditions were much more favorable. There was an abundance of labor, and indeed there was a considerable exodus of laborers from the Pennsylvania coke regions, many of these returning to European countries. It will be seen from the table that Pennsylvania continued far in the lead in the production of coke, followed by West Virginia, Alabama, Virginia, Colorado and New Mexico in the order named.

**COLE, LUCIUS A.** See NECROLOGY.

**COLGATE UNIVERSITY.** An institution of higher learning at Hamilton, N. Y., founded in 1819. The enrollment in 1910-11 was as follows: College 360; theological seminary, 40; academy, 140. The members of the faculty numbered 45. During the year William Henry Allison, Ph. D., was appointed professor of ecclesiastical history and dean of the theological faculty in place of Sylvester Burnham, D. D., resigned. Professor F. C. French, Ph. D., was made professor of philosophy. The benefactions during the year amounted to \$49,000. The productive funds amounted approximately to \$2,000,000 and the total income from all sources to about \$225,00. During the year the steam heating plant was extended to all buildings of the institution and the old dormitories were modernized. Professor Melbourne S. Read of the chair of psychology and education was made secretary of the college. The President is Elmer Burritt Bryan.

**COLLECTIVE AGREEMENTS.** See TRADE UNIONS.

**COLLEGE CHESS TOURNAMENT.** See CHESS.

**COLLEGES.** See UNIVERSITIES AND COLLEGES, and under individual heads.

**COLLEGES, AGRICULTURAL.** See AGRICULTURAL EDUCATION.

**COLLINS, DAVID.** See LITERATURE, ENGLISH AND AMERICAN, *History*.

**COLLINS, LOTTIE.** See NECROLOGY.

**COLLINS, W. W.** See LITERATURE, ENGLISH AND AMERICAN, *Travel and Description*.

**COLOMBIA.** A northwestern republic of South America. The capital is Bogotá.

**AREA, POPULATION, ETC.** The area is variously estimated at from 435,100 to 465,700 square miles. In 1905 the country was divided into 15 departments and four territories. In 1908 a redivision into 27 departments and two territories was adopted. In December, 1909, a law was enacted providing that, beginning April 1, 1910, the political divisions should be the same as they were on Jan. 1, 1905, viz., nine departments and four territories. A decree of April 16, 1910, established 13 departments. Accordingly, it seems hazardous to be dogmatic upon Colombia's internal boundaries. In addition to the large divisions, there is the small national district containing the capital. The population of the republic is estimated at 4,320,000, exclusive of about 30,000 uncivilized Indians. The larger cities, with estimated populations, are: Bogotá, 150,000; Medellín, 60,000; Barranquilla, 42,000; Bucaramanga, 30,000; Cartagena, 27,000; Cúcuta, 10,000. According to the above-mentioned decree of April 16, one of the departments was Panama, included apparently to avoid even a tacit recognition of independence. In this connection it should be noted that late in December, 1910, Panama made unsuccessful overtures for the re-establishment of relations. Primary instruction is free, but not compulsory. There are several normal schools and a few institutions for professional education. Public schools number about 2990, with about 237,000 pupils. The state religion is Roman Catholicism.

**INDUSTRIES.** Agriculture and mining are the chief industries. The products include bananas and other tropical fruits, coffee, cacao, sugarcane, cotton, corn, rubber, and wheat, barley, and other crops of the temperate zone. The annual coffee yield is about 600,000 bags. Banana culture is extending. The estimated number of cattle is about 4,000,000. The mineral wealth of the country, especially in Antioquia, is very great. The annual output of gold and silver is valued at \$4,000,000. There are rich deposits of copper, lead, zinc, mercury, iron, platinum, salt, and other minerals. The famous emerald mines of Muzo and Cosquez (75 and 78 miles respectively north of Bogotá), which are owned by the government, were leased in 1909 to an English syndicate, which engaged to sell at least \$1,250,000 worth of emeralds a year. In 1907 the government receipts from these mines were \$371,301.

Manufacturing industries are comparatively unimportant, but in some of the larger towns there are establishments for the manufacture of various articles of common use, as cotton textiles, shoes, hosiery, matches, sugar, liquors, flour, and brick.

**COMMERCE.** The values of imports and exports have been as follows, in United States gold:

	1907	1908	1909
Imports .....	\$12,088,563	\$13,513,892	\$10,561,047
Exports .....	13,791,442	14,998,744	15,513,346

At the two leading ports, imports and exports respectively were in 1909: Baranquilla, \$5,744,570 and \$5,689,017; Cartagena, \$2,264,470 and \$4,548,896. The principal imports are flour, lard, petroleum, and cotton goods from the United States; sugar, rice, and potatoes from Germany; and cotton goods from Great Britain. The leading exports are gold, coffee, cattle, rubber, tobacco, ivory, nuts, and bananas. Of the coffee exports about 67 per cent. goes to the United States, and most of the tobacco to Germany.

**COMMUNICATIONS.** At the end of 1909 there were in operation 821 kilometres (511 miles) of railway, comprising mostly short lines engaged in local traffic. Railway extension was in progress during 1910. During the last four or five years there has been considerable development, not only in railways, but in wagon roads and river navigation. Telegraph offices, 524, with 10,676 miles of line. Post-offices, about 500.

**FINANCE.** For several years the government has experienced serious financial difficulties and has counted itself successful when able to maintain the value of the paper currency as compared with gold at a ratio of 100 to one. Trade and industry show unsatisfactory development. The country has not yet recovered from the civil war of 1900-2, and internal troubles are still of frequent occurrence. Estimated revenue and expenditure for 1909 are reported to balance at \$16,600,000 and for 1910 at \$10,831,500. The largest source of revenue is customs (est. \$7,060,000 in 1910). The larger estimated expenditures for 1910: public works, \$2,712,044; service of the debt, \$2,247,117; department of the interior, \$2,686,278; war, \$2,456,438. The external debt amounts to about \$13,500,000; to this sum must be added upwards of \$526,500 arrears of interest and railway bonds for about \$935,600. Internal debt (1907), 5,476,888 dollars silver; floating debt (1908), \$3,063,012. These debts are exclusive of outstanding paper currency, amounting probably to some 700,000,000 pesos. The gold dollar, or peso, is equivalent to the United States dollar; the silver peso fluctuates with the price of silver; and the paper peso is legally current at one cent, but its actual purchasing power fluctuates considerably.

**ARMY.** Military service by law is compulsory and every able-bodied male is liable for service in the National Army. In practice the law is not enforced and the standing army is maintained at less than 10,000, the strength being determined annually by Congress. This standing army theoretically was capable of being increased to a war effective strength of 60,000, but such an army would be but partially trained.

**GOVERNMENT.** The executive authority is vested in a president, who is elected by the Congress for a (constitutional) term of four years, and is assisted by a cabinet of six ministers. The Congress consists of the Senate and the House of Representatives, members of the former being chosen by indirect, and of the latter by direct vote. In 1904 Gen. Rafael Reyes was elected President, and in the following year, by Congressional resolution, his term of office was extended to ten years, dating from Jan. 1,

1905. In the summer of 1909 he resigned, and on August 3, Gen. Ramón González Valencia was designated by the Congress to serve for one year. On July 15, 1910, the Congress elected Carlos E. Restrepo, who was inaugurated on August 7 for a four-year term.

**HISTORY.** There were evidences of anti-American feeling in Bogotá, the capital, in the spring, when a railway owned by an American citizen under a concession which was not approved by the people, had to discontinue its service on account of the attacks of the mob, and there were further riotous movements apparently actuated by the same motive in March. An apology was tendered to the United States Minister. The government imposed a tax on American flour brought from the coast to the interior. The Minister of Finance opposed this measure and resigned in protest. Elections for a constitutional assembly were held on April 3. Señor Carlos E. Restrepo was elected president on July 6, succeeding Gen. González Valencia. The centennial anniversary of independence was celebrated at Bogotá on July 20, 1910. See **LEPROSY**.

**COLONIAL DAMES.** See **PATRIOTIC SOCIETIES**.

**COLONNE, JULES JUDE**, also called **EDOUARD**. A French musical conductor and violinist, died in April, 1910. He was born at Bordeaux in 1838 and studied at the Conservatory in Paris. After taking the prize in Harmony and the first prize in violin at the Conservatory, he became first violin at the Opera House, but resigned that position in order to establish a series of Sunday concerts at the Odéon, known later as the Association Artistique. He first played in operas the works of Tschaikowsky, Grieg, Wagner and Raff. He was very popular as a "guest-conductor." In 1904 he visited the United States.

**COLONUS.** See **ARCHÆOLOGY**.

**COLOR.** See **CHEMISTRY**, *Color of Dyestuffs*.

**COLORADO.** One of the States in the Mountain Division of the United States. It has an area of 103,658 sq. miles of land surface, and 290 miles of water surface. Its capital is Denver.

**POPULATION.** The population of the State in 1910, according to the Thirteenth Census, was 799,024 as compared with 539,700 in 1900 and 413,249 in 1890. In the decade 1900 to 1910 there was an increase of 48 per cent. The State ranks 32nd in point of population, the same relative rank which it held in 1900. The population of the larger towns and cities will be found in the tables in the article, **UNITED STATES CENSUS**.

**MINERAL PRODUCTION.** Mining is the principal industry of the State. Up to 1910 it was the leading State in the production of gold. In that year, however, it was outstripped by California. The value of the gold production in Colorado in 1910, according to the preliminary estimates of the United States Geological Survey, was \$20,408,641, as compared with a value of \$21,846,600 in 1909. The State ranks fourth in the production of silver, being surpassed only by Montana, Utah and Nevada. There were produced in 1910 8,747,777 fine ounces of silver as compared with 8,846,300 fine ounces in 1909.

The State is an important producer of coal. The product in 1910 was 10,716,936 short tons, having a spot value of \$14,296,012. Since 1899 Colorado has occupied first place among the

coal producing States west of the Mississippi and ranks eighth among all the States. The State possesses large supplies of good coking coal and it is assuming considerable importance in the manufacture of iron and steel. The output of coal of 1909 exceeded that of 1908 by 1,081,963 short tons and was within 75,000 tons of the maximum record, that of 1907. The average price per ton, however, decreased from \$1.41 in 1908 to \$1.33 in 1909. There were but two strikes, neither of which was important, during the year. In 1909 there were 95 fatal accidents in the coal mines of the State. The reports of the United States Geological Survey indicate an increase in the production in 1910 over that of 1909 of about 20 per cent. so that the output was approximately 12,000,000 tons. There was an unusually large demand for Colorado coal in 1910 for the use of the railroads running between Colorado and the Mississippi River. There was also a better domestic demand during the summer months.

The State produces a considerable amount of lead. The product in 1909 was 29,326 tons as compared with 28,728 tons in 1908. Large quantities of copper are produced. In 1909 the output was 11,485,631 lbs., which was a decrease from the product of 1908, which was 13,943,878 lbs. The State ranks third in the production of spelter. The product in 1909 was 20,121 tons as compared with 24,885 tons in 1908. Other mineral products are clay products, stone and mineral waters.

According to the estimates of the United States Geological Survey, the production of precious metals in the State in 1910 showed a decrease. The silver production, however, increased slightly in value, owing to an increased price per fine ounce in 1910. There was considerable increase in the lead output, but a decrease in the yield of copper. Less gold and silver were recovered both from bullion and from smelting ore.

**AGRICULTURE.** The acreage, production and value of the principal crops in 1909 and 1910 are shown in the following table:

COLORADO CROP TABLE

	Acreage	Prod. bu.	Value.
Corn 1910.....	143,000	2,846,000	\$1,708,000
1909.....	135,000	3,267,000	2,287,000
Winter wheat 1910..	104,000	2,392,000	1,961,000
1909..	90,000	2,673,000	2,486,000
Spring wheat, 1910 ..	289,000	6,329,000	5,190,000
1909..	275,000	8,085,000	7,519,000
Oats, 1910.....	202,000	7,898,000	3,633,000
1909.....	196,000	7,448,000	3,947,000
Barley, 1910.....	27,000	864,000	518,000
1909.....	6,000	936,000	618,000
Rye, 1910.....	5,000	70,000	47,000
1909.....	1,000	88,000	64,000
Potatoes, 1910.....	65,000	6,500,000	3,575,000
1909.....	65,000	10,400,000	5,928,000
Hay, 1910.....	700,000	1,400,000a	15,120,000
1909.....	704,000	1,760,000a	17,600,000

(a) Tons.

The crops in general showed a decrease in 1910 from the production of 1909. This is true in the case of corn, winter wheat, spring wheat, barley, rye, potatoes and hay, all of which show a falling off. The corn crop was nearly 1,000,000 bushels less than in 1909 and the crop of spring wheat was nearly 2,000,000 bushels less in 1910. Potatoes showed a decrease of nearly 4,000,000 bushels. The State ranks first in the production of beet sugar.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions under the control of the State, with their disbursements during the biennial period of 1909-10 were the following: Dependent Children's Home, \$1000; State Insane Asylum, \$180,926; State Reformatory, \$4371; Soldiers' and Sailors' Home, \$39,180. No legislation relating to charities and corrections was enacted during 1910. In 1909 a bill was passed authorizing the establishment and direction of a home and training school for mental defectives. The State Land Board donated 310 acres of land for this institution and an administration building is now in course of erection. A bill for the erection of four cottages and other necessary buildings will be presented to the legislature of 1911.

**POLITICS AND GOVERNMENT.** There was no regular session of the legislature in 1910 as the sessions are biennial and the last was held in 1909. There was, however, a special session called. Both houses passed a primary bill, provided for the appointment instead of the election of railroad commissioners, and submitted an amendment to make the initiative and referendum a part of the constitution. This amendment was subsequently adopted by a large majority. The next general assembly will begin January 4, 1911.

**CONVENTIONS AND ELECTIONS.** The Republican State convention was held in Colorado Springs and nominated State Senator John B. Stephen for governor. The convention in its platform warmly commended President Taft for his course and achievements and declared itself proud of the record of his administration. Although Mr. Roosevelt received during a visit to the House an enthusiastic welcome his name was not prominently mentioned in the State convention. Senator Guggenheim was praised for his work in Congress and his liberal gifts to State institutions. The Democratic convention was held in Denver on September 14, and Governor John F. Shafroth was renominated for governor over Mr. B. L. Jefferson, Register of the State Land Board. Congressman at large, Edward T. Taylor and Chief Justice Robert W. Steele were also renominated. On October 12, Justice Steele died, and the Democrats nominated Julius F. Gunter, a former member of the Supreme Court, in his place. In the election on November 8, the Democrats were in the main successful. They elected the three representatives in Congress, and all their State ticket with the following exceptions: The Republicans elected James E. Garrigues Supreme Judge, Mrs. Helen M. Wilson Superintendent of Public Instruction, Benjamin Griffith, Attorney-General, W. J. King and Miss Anna Wolcott regents of the State university and S. S. Kendall Railroad Commissioner. Miss Wolcott is a sister of Former United States Senator Edward O. Wolcott.

Four women were elected to the legislature. Upon several other occasions, however, women sat in that body.

**CONSTITUTIONAL AMENDMENTS.** In addition to the initiative and referendum amendment already mentioned, the people adopted at the general election amendments to the State constitution providing for the payment of legislators by salaries instead of per diem, for the establishment of a land board to be appointed by the governor instead of composed as heretofore by other officers acting as members of the board ex officio, and granting the State university, which

is at Boulder, permission to conduct part of its medical course in the city of Denver.

**OTHER EVENTS.** The year was notable for several bad coal mine disasters. On January 31, an explosion in the mine of the Colorado Fuel and Iron Company at Primero, near Trinidad, entombed one hundred men. This was the second disaster in this mine. A former one took place on January 23, 1907, in which twenty-six lives were lost. On October 9, a gas explosion wrecked the coal mine of the Colorado Fuel and Iron Company, at Starkville. Over sixty men were entombed. On election day fifty-nine miners were killed by an explosion in the Victor American coal mine at Delagua. An explosion followed by a fire killed ten men in the mine of the Leyden Coal Company, on December 14, about twelve miles from Denver.

**STATE OFFICERS.** Governor, John H. Shafroth; Lieutenant-Governor, Stephen R. Fitzgarrald; Secretary of State, James B. Pearce; Treasurer, Ready Kenahan; Auditor, M. A. Leddy; Attorney-General, Benj. Griffith; Superintendent of Public Instruction, Helen M. Wixon; Commissioner of Insurance, William L. Clayton—all Democrats except Griffith, Wixon and Clayton.

**JUDICIARY.** Supreme Court: Chief Justice, John Campbell, Rep.; Justices, S. H. White, Dem.; W. A. Hill, Dem.; M. S. Bailey, Dem.; Wm. H. Gabbert, Rep.; G. W. Musser, Dem.; Clerk, James R. Killian, Dem.

STATE LEGISLATURE, 1911.

**COLORED METHODISTS.** Included under this title are the African Methodist Episcopal Church, the African Methodist Episcopal Zion Church, the Colored Protestant Episcopal Church, the Union American Methodist Episcopal Church, the African Union Methodist Protestant Church and the Zion Union Apostolic Church. Of these the largest body is the African Methodist Episcopal Church, which had in 1906, the latest year for which statistics are available, 858,323 communicants, 6920 churches and 6170 ministers. The African Methodist Episcopal Zion Church had in 1908 583,106 communicants, 3280 churches and 3986 ministers. The Colored Methodist Episcopal Church had 233,911 communicants, 2809 churches and 2863 ministers. The remaining denominations have a comparatively small number of communicants. All are strongest in the Southern States.

**COLOR VARIATIONS.** See BIOLOGY.

**COLUMBIA, BRITISH.** See BRITISH COLUMBIA.

**COLUMBIA, DISTRICT OF.** See under UNITED STATES.

**COLUMBIA UNIVERSITY.** An institution of higher learning in New York City,

founded in 1754. The attendance in 1910-11 was 7429 (including 1965 summer session students, but excluding 1836 students in extension teaching.) These students were distributed as follows: 732 in Columbia College; 524 in Barnard College; 1177 non-professional graduate students and 3259 professional students in education, applied science, medicine, law, pharmacy and fine arts. In 1909-10 all parts of the United States, and thirty foreign countries, were represented in the student body, the graduate students representing 340 other colleges and universities. During 1909-10 Columbia received money gifts of \$2,045,335.40, Teachers College received \$294,376.99, and Barnard College \$15,766.91, a total of \$2,355,479.30. Between 1901 and 1910 the several corporations of the University received a total of \$13,618,912.95 in money gifts. The total assets in 1910 were \$14,351,843.86 in educational equipment, and \$28,519,930.42 in endowment. The library contained 450,000 bound volumes. The total income for 1909-10 (including Barnard College, Teachers College, and the College of Pharmacy) was \$2,190,982.95. The estimated expenditure for 1910-11 was \$2,754,375. In 1910-11 the teaching and administrative staff of the University numbered 761. At the commencement of 1910, 1323 degrees and diplomas were granted.

For the past decade the University has been able to do comparatively little in the development of new fields. The gifts made in that period, generous though they have been, have of necessity been used largely in the development of the Morningside site,—what was left barely serving the institution to keep pace with its increasing registration.

Courses are being formulated in Preventive Medicine, Forest Engineering and Agricultural Engineering. The gift of Mr. Blodgett of a farm near Fishkill will greatly aid the work in agriculture. Mr. George Crocker's bequest for research in cancer will open up a new field of investigation at the Medical School. A most advantageous agreement with the Presbyterian Hospital has just been consummated, which will greatly enhance the work of the Medical School and do much to further medical education and research in New York City. The work of the Department of Extension Teaching has been increased and standardized. Musical chorus work is being especially featured. The work of the Committee on Undergraduate Admissions, created in 1909, is now bearing fruit. The close personal handling of each individual case and the system of reports from secondary schools has given the candidate for admission the benefit of his preparatory school record. The opportunities open to students in all the professional courses are being extended as rapidly as possible by bringing them into direct contact with experts—alumni and others—in the professional field which they purpose to enter. The president is Nicholas Murray Butler.

**COMFORT, GEORGE FISK.** An American educator, author, and art director, died, May 5

1910. He was born in Berkshire, N. Y., in 1833, and graduated from Wesleyan University in 1857. From 1860 to 1865 he studied art, philosophy and history in Europe. From the latter year until 1868 he was professor of æsthetics and modern languages in Allegheny College. From 1868 to 1872 he was lecturer in Christian art and archæology at the Drew Theological Seminary. In 1872 he became professor of modern languages and æsthetics at Syracuse University, serving in that position until 1893. During this time he organized the College of Fine Arts at the University and was made its dean. In 1896 he organized the Syracuse Museum of Fine Arts, of which he was director from that time until his death. He was one of the founders of the Metropolitan Museum of Art, New York, and was corresponding member of many learned institutions and societies in Europe and the United States. He was the author of *Art Museums in America*, *Modern Languages in Education*, a series of German textbooks and many contributions on art and history to periodicals and encyclopædias. From 1872 to 1893 he was art editor of the *Northern Christian Advocate*.

**COMMERCE.** The trade of the United States with foreign countries is treated in the article UNITED STATES, section *Imports and Exports*, and internal trade will be found in the article under *Inland Commerce*.

The trade of foreign countries will be found in the articles on those countries. For further details see the articles on the industries and FINANCIAL REVIEW.

**COMPULSORY ARBITRATION.** See ARBITRATION, INTERNATIONAL.

**COMPULSORY VOTING.** Compulsory voting is not an untried experiment, but a working system, in at least two countries of Europe.

In the first of these, Austria, it is not of universal application. It is applied in the election of members of the Reichsrath, or national parliament, in six different provinces, including Lower Austria and Upper Austria. Every voter is required to present his electoral ticket, the penalty for failure being a fine of from one to fifty kronen. In Belgium the system has been in successful operation for more than sixteen years and it has been proved that it is not necessary to have drastic penalties to enforce compliance with the law. In brief, the penal pro-

visions consist of publicity—likely to be the most effective deterrent—a reprimand or fine for the first offense, a little larger fine for the second offense, for the third the same fine and a more severe dose of publicity, and for the fourth deprivation of the right to vote for a period of ten years. In no event is imprisonment imposed. How has the plan worked? An authority says: "It was put in operation in 1893, and previous to that time approximately 16 per cent. of the electors failed to vote. Under the compulsory law the percentage of non-voters fell to 4 or 5 per cent. In 1898, out of 1,058,165 electors called to the polls, 5551 failed to attend without giving previous notice of the reason and were summoned into court; of that relatively small number 2611 were excused by the magistrates on such grounds as illness, age, or absence, and 2930 were fined.

In 1907 a bill was proposed in Wisconsin which attempted to secure compulsory voting by imposing a poll tax of \$10, of which \$9 should be remitted if the taxpayer appeared at the polls to vote. In New York county, under the provisions of certain sections of article 17 of the consolidated Judiciary Law, there is something of an attempt to provide for the same end. The Commissioner of Jurors must make up two lists of those qualified to serve on trial juries, one called the voters' list, containing the names of those who have duly registered at the last preceding election, and the other, the non-voters' list, containing the names of those who have not so registered. In the drawings for trial juries the non-voters' list as so made up must be first used before the voters' list is used. As a practical result, however, this provision is not at all effectual, because it is almost impossible to obtain any considerable list of non-registered persons for the non-voters' list, although the city directory and similar sources are used.

**COMSTOCK, CYRUS BALLOU.** An American army officer and educator, died May 29, 1910. He was born at West Wrentham, Mass., in 1831 and graduated from the United States Military Academy in 1855. He became second lieutenant in the corps of engineers and until 1859 was engaged in the construction of Fort Taylor, Fla., and Fort Carroll, Md. After this he became assistant professor of natural and experimental philosophy at the United States Military Academy. He served in the defenses of Washington during the Civil War, becoming in August, 1861, assistant to the chief of engineers of the Army of the Potomac. He remained with this army during the campaign of 1862 and the Maryland campaign and was made chief of engineers in November, 1862. At the siege of Vicksburg he was chief engineer of the Army of the Tennessee and was later assistant inspector of the military division of the Mississippi. From March, 1864, until the close of the war he was senior aide-de-camp to General Grant and from the close of the war to 1870 he served as aide to the general-in-chief at Washington. For several years he was a member and president of the Mississippi River Commission and was a member also of the Permanent Board of Engineers for Fortifications. From 1870 until his retirement in 1895 he was occupied as superintendent of the Geodetic Survey of the northern and northwestern lakes and in other important service, including improvements of the mouth of the Mississippi. He was advanced to the rank of brigadier-general, retired, in 1904.

**CONANT, CHARLES A.** See **CENTRAL BANK. CONCRETS.** See **MUSC.**

**CONCRETE.** The various uses to which concrete, especially when reinforced by metal rods or framing, is put continued to increase. Long ago its value as a structural material was realized and in these columns the record for 1910 can only mention some of the most interesting of the novel or unusual applications.

**REINFORCED CONCRETE SNOW-SHED.** In the Cascade Mountains the Great Northern Railway, like other transcontinental lines, is obliged to build and maintain snow-sheds in order to keep its road open to traffic with any degree of certainty during the winter and spring months. In addition to the danger of the destruction of wooden sheds by forest and other fires, there is also the menace of their annihilation by avalanches from the steep mountain sides. In order to prevent a repetition of this sort of catastrophe, which occurred about a year ago and overwhelmed two trains, causing great loss of life, the Great Northern was building at Wellington, Wash., a reinforced concrete snow-shed, indestructible by fire, located to avoid somewhat the direct slide from above, and having the roof designed to form an incline that will allow an avalanche to slide easily over it without doing serious damage.

The new shed involved the re-location of the line for a distance of about 1000 feet, setting it farther into the mountainside. The side next the mountain was strengthened by carrying the base into the bank so that the section of the inner wall of the shed is a right angle triangle having a ratio of base to altitude of about 2 to 3. The structure accommodates two tracks and is 3900 feet long, having a roof of heavily reinforced concrete 10 inches thick, resting on rafters of the same material 2 feet 5 inches deep. These in turn are supported by columns 20 x 24 inches in section, set 10 feet centre to centre along the track, and giving 21 feet clear head-room at the outer edge of the road-bed. A second row of columns between the two tracks gives an additional, intermediate support to the roof.

**REINFORCED CONCRETE OIL RESERVOIR.** In the oil district of California near San Luis Obispo, two reservoirs were built during the year to receive and store oil, each of which holds one million (1,000,000) gallons. Oil wells were sunk and the industry developed in this region faster than the facilities to take care of it, and in some cases oil was kept in pools in the ground until a plant could be established. These reservoirs were built of reinforced concrete, 601 feet inside diameter and 20 feet 4½ inches high, forming circular tanks, conveniently near together. The walls are 3 feet thick at the base and 6 inches at the top. The reinforcement was by ½-inch round steel rods. The dirt and sand removed to make the shallow excavation level on the floor was dumped to form a circular embankment outside the reservoir wall, but separated from it by an annular space about 20 feet, thus forming a sort of fire lane around it. The floor of the reservoir is 2½ inches thick, formed on galvanized steel wire netting.

**MOVABLE DAMS, N. Y. STATE BARGE CANAL.** That part of the so-called Barge Canal lying between Rome, N. Y., and a point a few miles west of the Hudson River, will make use of the Mohawk River. This latter stream, however, is subject to variation of level following droughts and floods, and for that reason, a sys-

tem of fixed dams or dikes to store water for use during dry seasons might cause serious and extensive damage by backing up water in times of flood, particularly when ice is moving out suddenly or in large quantity. To meet these conditions, a number of movable or adjustable dams were started, and two of them were to be in use by the spring of 1911. They are aprons suspended from bridges built across the canal, hung by chains from the bridge structure and arranged so as to be raised or lowered to suit the state of the water in the river. The bridges are of various span lengths from 180 feet to 216 feet, and of the curved upperchord Pratt truss type. At each post of the truss are heavy floor beams from which are hung the frameworks that carry the dam gates. The gates are made in sections, each being about 30 feet long and 11 feet high, made of three buckled plates, one above the other, and heavily braced and riveted to the framework. In order to be fairly watertight at the bottom, a sill or floor is put down on the river bed, extending beyond the bridge, made of concrete in which cast iron blocks are imbedded to serve as stops for the gates; and the floor is on a slight incline so as to give the bottom edge of the gate a good bearing. The concrete floor rests on a bed of riprap. Eight of these movable dams were in course of construction between Schenectady and Little Falls at the close of the year. See also **DAMS.**

**SIPHON LOCK, N. Y. STATE BARGE CANAL.** The locks on the Barge Canal are of considerable size, 300 feet to 310 feet long, 45 feet wide, and will have 12 feet depth of water at the lowest level. They are built of reinforced concrete and have steel gates operated by electric motors controlled from a switchboard in the lock-tender's house. At Oswego, N. Y., there are two locks at the entrance of the canal to Lake Ontario that have just been built embodying an unusual method of emptying and filling; namely, the use of a siphon. Siphon locks have been built on the Teltow and other canals in Germany, but have never been used in the United States. The Oswego locks are built with a siphon at each end, communicating with the upper and lower pool respectively, and having in connection with each siphon a chamber or tank called a vacuum tank for the purpose of putting the siphon in operation or for stopping the flow of water by admitting air to the top of the siphon. In each wall of the lock there is a longitudinal culvert that terminates in the siphon, and having side openings communicating with the water in the pools 3 feet or 4 feet below low water level in them. This culvert is 5 feet high and 7 feet wide. The siphon is made smaller at its highest point than at the inlet or outlet; and is of rectangular section at the top, 5 feet x 6 feet. A 12-inch pipe, in which a gate valve is placed, conducts water from the upper pool to the vacuum tank and fills it. A 20-inch pipe, with a similar valve, serves to empty the tank.

In operation, the vacuum tank is filled with water and the inlet valve closed. Then the outlet valve is opened, the water runs out and its place is taken by air drawn through a small pipe leading from the upper part of the siphon to the tank. This action, by removing air from the siphon, starts the flow of water through it, and incidentally refills the vacuum tank. There is a difference of level of 10 feet between the levels of water in the upper and lower pools,

with a leeway of 1 foot. The arrangement is easy to control, simple to operate, and should cost but little to maintain. See also BRIDGES and CANALS.

**CONCRETE BARGES.** An experimental barge constructed of reinforced concrete was built and put in use on the Panama Canal. Its behavior proved so satisfactory that three more were to be built by the Canal Commission. A barge for this particular service must be capable of carrying considerable weight, all on deck, with a light draft of water. The vessel is of the common flat-bottomed, rectangular type with a rake at both ends to enable loading to be accomplished from sloping banks. It is 64 feet long and 24 feet beam, by 5 feet deep inside. The hull is divided into three longitudinal compartments 8 feet wide each by bulkheads running from end to end. There are also transverse frames 10 feet apart that tie together and stiffen the gunwales, bottom and bulkheads. Heavy towing bits are built into the structure in such a way as to distribute the strain throughout. The principal reinforcement is of  $\frac{1}{2}$ -inch square corrugated steel bars spaced 9 inches apart longitudinally, and 12 inches crosswise. The bottom and the gunwales are formed on a layer of No 12 gauge steel wire cloth of  $\frac{1}{2}$ -inch mesh attached to  $\frac{1}{2}$ -inch reinforcing bars. The sides and bottom are  $2\frac{1}{2}$  inches thick and the deck 4 inches. In the latter are six manholes 21 inches in diameter. The weight is estimated at 165 tons, and the unloaded draft is from 2 feet 9 inches to 3 feet of water.

For use of reinforced concrete in boiler settings see BOILERS.

**CONDER, CLAUDE REIGNIER.** An English army officer, explorer and archæologist, died February 16, 1910. He was born in England in 1848, and was educated at University College, London. From 1872 to 1878 and from 1881 to 1882 he was in command of the survey of Palestine. In 1882 he surveyed with the English army in Egypt and in 1884-85 took part in the campaigns in Bechuanaland. From 1887 to 1894 he was British Commissioner of the Transvaal Border and was on service with the Headquarters Ordinance Survey. In 1895 he was under the Irish office in charge of relief of distress and in 1905 he was engaged in ordinance survey in Ireland. He rose to the rank of colonel. Colonel Conder was long associated with the Palestine Exploration Fund, and he is best known through his surveys and archæological writings relating to Palestine. Among his published works dealing with Palestine are the following: *Tent Work in Palestine* (1878); *Judas Maccabæus* (1879); *Heth and Moab* (1883); *Memoirs of the Survey of Western Palestine* (1883); *Memoirs of the Survey of Eastern Palestine* (1890); *Altaic Hieroglyphs* (1887); *Primer of Bible Geography* (1884); *Handbook of the Bible* (1879); *Palestine* (1891); *Tel-Amarna Tablets* (1893); *The Bible*

*and the East* (1896); *The Latin Kingdom of Jerusalem* (1897); *The Hittites and their Language* (1898); *The Hebrew Tragedy* (1900); *The First Bible* (1903); *The City of Jerusalem* (1909).

**CONGESTION OF POPULATION.** See POPULATION, CONGESTION OF.

**CONGO, BELGIAN.** A Belgian colony (since 1908) in central Africa; formerly the Congo Free State, founded in 1882 by Leopold II and till 1908 under his direct sovereignty. Capital, Boma.

**AREA, POPULATION, ETC.** Estimated area, 920,000 square miles. Various estimates for the population are given: official, 20,000,000; Sir H. Johnston, 15,500,000; still another, 9,000,000. European population, January, 1909, 2938. Population of Boma, 3300. Banana, at the mouth of the Congo, is the chief port. The population, mainly of Bantu origin, practice fetichism. There are 138 mission stations, with which the government coöperates; and children are taught at the four agricultural colonies.

**PRODUCTION.** Reform is the word of the hour in the Congo. The native is to have the products of the soil derived by his labor; taxation is to be in money; the Comité Spécial of Katanga is to be abolished. The country is to be opened to trade in three great steps: 1st, July 1, 1910, the Lower Congo, Stanley Pool, Ubangi, Bangali, Kwango, Kasai, Katanga, the Eastern Province (southern part), Aruwimi, and the river banks to Stanleyville; 2d, July 1, 1911, the Crown lands; 3d, July 1, 1912, the Welle district. The exploitation of Crown lands by the state will be totally abolished by 1912, by order of the Colonial Council; and other reforms tending to amelioration of existing conditions have been voted by that body. Rubber is the leading commercial product. Coffee and cacao are successfully grown, and ivory, palm kernels, palm oil, tobacco, and white copal are important products.

The mineral wealth of Katanga has been in large part the object of the recent extensive railroad building. Development work has begun and native labor is being employed. The copper deposits, in width between thirty and sixty miles, extend some 200 miles. Tin, gold, platinum, iron, palladium, and coal are known to exist.

**COMMERCE.** The trade, which is largely with Belgium, is given below for three years in francs:

	1907	1908	1909
Imports .....	25,182,000	32,561,300	28,482,000
Exports .....	58,895,000	57,383,100	78,014,000

The principal articles of export in the special trade for 1909 were rubber, 42,569,000 francs; ivory, 6,583,000; gold, 2,280,000; palm kernels, 1,835,000; palm oil, 984,000; cacao, 969,000;

white copal, 868,000. The total special trade, with countries of origin and destination, is given as follows (1909): Belgium, imports 19,734,000 francs; exports 39,429,000; Great Britain, 2,419 and 920,000; France, 1,059,000 and 8000; Germany, 1,023,000 and 66,000; Portuguese possessions, 666,000 and 2,279,000; Netherlands, 574,000 and 361,000; Portugal, 237,000 and 110,000; total imports (special trade), 22,127,000 francs; exports, 56,167,000. Vessels entered (1908) 224, of 582,267 tons; cleared, 227, of 587,865.

**COMMUNICATIONS.** The goal of the past four years of railway construction has been the rich mineral beds of Katanga. With the completion of the Katanga branch of the Cape-to-Cairo Railway the southern edge of this district is reached. The road from Benguela eastward will attain the same point. The roadbed round the last unnavigable reach of the upper Congo is completed, and when the track laying is finished the transportation route by rail and water from the river mouth to Kalengwe Falls (2500 miles) will be continuous. A branch now under way from Kalengwe Falls south through Katanga will effectively complete the opening up of that district. Total telegraph lines, 1083 miles. Post-offices, 30.

**FINANCE.** Revenue for 1907, 40,895,296 francs (ordinary, 35,762,339; extraordinary, 5,132,957); expenditure, 40,191,796 (ordinary, 35,747,531; extraordinary, 4,444,265). Revised revenue and expenditure for 1908, 35,378,000 and 39,245,963 francs respectively; for 1909, 36,094,036 and 44,517,336. Estimated for 1910: revenue, 39,745,305 francs (taxes in kind, 14,127,500; customs, 7,056,555; transports, etc., 3,282,000; direct taxes, 2,671,000); expenditure (including extraordinary, 33,516,775), 73,887,589 (ordinary, 40,370,814; of which Interior, 18,616,090; Finance, agriculture, etc., 10,436,870; expenditure in Europe, 7,753,894; Justice, etc., 2,790,630). Total public debt, 214,909,700 francs.

**ARMY.** The native armed force in 1910 consisted of 15,736 soldiers commanded by European officers. They were divided into 23 independent companies of infantry and recruitment was by conscription. There are maintained in addition a skeleton organization and a reserve corps. There are four camps of instruction.

**GOVERNMENT.** A responsible minister of the colonies is appointed by the King. He is president of the Colonial Council and a member of the Council of Ministers. A governor-general (1910, Baron Wahis) resides in the colony and is aided by several vice-governors-general. There are fourteen administrative districts, each under a commissioner. On May 14, 1910, an agreement was signed by representatives of Belgium, Great Britain and Germany, rectifying certain boundaries as follows: Germany to retain all of Runga; Belgium to have the west shore of Lake Kivu as a frontier; the island of Kwiswi in Lake Kivu to belong to Germany; Mount Ruwenzori to be divided between Belgium and Great Britain, the frontier crossing the crest of the range.

**HISTORY.** By the treaty of October 18, 1908, the Congo Free State was annexed to Belgium and in the same year the Belgian Parliament provided for its administration by the passage of the Colonial act. Promises of reform were made and on November 28, 1909, the Colonial Minister set forth the government's plans (see

paragraph PRODUCTION). They were embodied in a decree on March 22, 1910. Complaints were made, however, by the Congo reformers in England and the United States that the abuses continued and that the natives were no better off under the new régime. Sir Edward Grey declared in Parliament on March 10, 1910, his regret at the delay in carrying out the government's plans and at the fact that the abolition of forced labor applied only to the state lands. The fact that the personnel of the former government was so largely retained in the administration also caused distrust. Hence the British government had decided to withhold its acknowledgment of annexation till the country was opened to foreign trade and the forced labor system abolished. The young King Albert on his accession referred to the necessity for just administration of the Congo, and later, at the opening of the Colonial Exhibition at the end of April, he declared that the Colonial officials would introduce wise reforms and give the colony an administration worthy of Belgium. He condemned excessive exploitation of the country and favored a policy of colonization that should be sanctioned by Christian morals. The conditions in the Congo, however, were far from satisfactory to the reformers in England and the United States. In the former country a Parliamentary memorial, signed by 158 members of Parliament, was presented to the Prime Minister on May 6. This declared that as there might be some danger on the occasion of the King of Belgium's visit to England that the public would lose sight of the reasons for refusing to recognize the transfer of the Congo state to Belgium, they wished to remind the country of the necessity of insisting upon clear evidence of complete and effective change of system, and of not relying upon mere paper promises. The memorial said that although eighteen months had elapsed since the annexation, there had not been a change in the system of government. The promised reforms were utterly insufficient. No legislation had been drafted for the recognition of native rights in land and the Belgian Colonial Minister had repeatedly declared that no such rights exist. The Belgian government withheld the native rights to trade in the land's produce and treated that produce as tribute which the natives, as heretofore, were forced to gather for the government. "The Belgian government now declare that they will as an act of condescension permit the natives of the Congo to trade under such conditions and at such periods as are set forth in the decree of March 22 last—e. g., in one-half the Congo from July of this year; in one-third of the other half in July, 1911; in the second third of the other half, in July, 1912, while so far as the remaining territory is concerned no date is mentioned. In other words, the Belgian government assert their right not merely to maintain the evil system, but after benefiting from it for eighteen months, actually to prolong it for further extensive periods." For explorations in Belgian Congo in 1910, see EXPLORATION, *Detailed Survey of Africa*.

**CONGO, FRENCH.** See FRENCH CONGO.

**CONGO FREE STATE.** See CONGO, BELGIAN.

**CONGREGATIONALISTS.** Congregational Church is a term applied to a body of Christian believers, the rise of whose organized church life began with the Puritan movement in Eng-

land during the latter half of the sixteenth century. The congregations in the United States constitute the eighth largest religious body. Congregationalism in its churches is found in their relation to each other, under—first, a group of churches in annual session which is called an "Association"; second, all the churches of a State, meeting annually, called "conference"; and third, National Council, the constituency of which is formed by delegates in triennial sessions from all the associations and conferences. The chief organizations, under the auspices of which the benevolent and missionary work of the churches is carried on, are: the American Board of Commissioners for Foreign Missions; the Congregational Education Society; the Congregational Church Building Society; the Congregational Home Missionary Society; the American Missionary Association; the Congregational Sunday School and Publishing Society; the Congregational Board of Ministerial Relief. There are also the Woman's Foreign Mission Boards, and the Woman's Auxiliaries, for home missionary work. For fellowship, culture and inspiration, organizations called clubs are maintained. There are about fifty such bodies in the United States. A license to preach is granted in some States by associations of the churches. Ministerial standing is vested in either a local or a ministerial body as determined by locality. In pastoral relations a minister is found serving a church as supply, under a temporary arrangement; as pastor, whose term of service is defined; as pastor installed, in which case the incumbent is inducted into office by ecclesiastical council, convened by letter-missive; and as pastor, recognized, in which case a council convened by letter-missive approves the course of the parties contracting and gives a token of its fellowship in services appropriate to the occasion. There is hardly any doubt that the day of the ecclesiastical council for installing a pastor is passing away.

The theological seminaries known as Congregational are, Yale, opened in 1822 (undenominational); Bangor, 1816; Hartford, 1834; Oberlin, 1835; Chicago, 1855; Pacific, 1869; and Atlanta, 1901. In these institutions are 372 undergraduates and 118 instructors. Forty colleges were founded by Congregationalists. In these are enrolled 23,097 students. The instructors number 1842. In their libraries there are 1,665,239 volumes. The amount of productive funds is \$2,964,485,689. On January 1, 1910, Congregationalists numbered 730,718, in the United States. There were at that date, as reported, 5991 churches and 5988 ministers. The Sunday school enrolled 696,367 members. For home expenses the amount was \$9,107,519. The total of contributions was \$2,813,242, which was distributed as follows: Foreign Missions, \$599,289; Education, \$246,108; Church Building, \$109,665; Home Missions, \$662,060; American Missionary Association, \$181,772; Sunday school work, \$65,851; ministerial relief, \$36,729; and for other purposes, \$952,668. World-wide Congregationalism reports, 14,166 churches and chapels; 1,373,557 members, and 1,598,105 members in Sunday schools.

The last National Council assembled in Boston, October, 1910, and discovered in its discussions and resolutions a decided trend toward centralization for the sake of a larger efficiency. Committees on ministerial and religious education will work to conserve and strengthen

the intellectual culture of the ministry, and a more scientific understanding and application of biblical literature and teaching, especially in the interest of the young. A commission on apportionment was created to develop the benefit of the churches for missionary service. A commission of nineteen was created with a view to expansion under an increased secretarial force. The feeling is decidedly optimistic and large things, it is expected, will be realized.

The next session of the National Council will be held in Kansas City, Mo., 1913. The officers are: Moderator, Rev. Nehemiah Boynton, D. D., Brooklyn, N. Y.; Secretary and Editor, Rev. Asher Anderson, D. D., Boston, Mass.; Treasurer and Registrar, Rev. Joel S. Ives, Hartford, Conn.

**CONGREGATIONAL METHODIST CHURCH.** A religious denomination which had its source in objections made to certain features of the episcopacy and itineracy of the Methodist Episcopal Church in Georgia. A conference was held in Georgia in May, 1852. This adhered strictly to the doctrine of Methodism, but adopted the Congregational form of government. The movement extended into the States of Alabama, Florida and Mississippi. Churches at the present time are found in most of the Southern and some of the Northern States. According to the religious census made by the United States Census Bureau in 1906 and published in 1910, the denomination had in the former year 14,279 communicants, with 262 church edifices and 324 ministers. These figures show a marked growth of the denomination in the decade 1890 to 1910. According to statistics gathered by Dr. H. K. Carroll, in 1910, the denomination had in that year, 15,529 communicants, 333 churches and 337 ministers. The missionary work of the denomination is not carried on through any subsidiary organizations as is the case of most denominations, but is the general concern of all the churches and members. The only educational institution identified with the denomination is the Atlanta Bible School, which is under the control of an incorporated board elected by the General Conference. The denomination maintains a publishing house at Atlanta, Georgia.

**CONGRESS.** See UNITED STATES.

**CONNELLEY, W. E.** See LITERATURE, ENGLISH AND AMERICAN, *Biography*.

**CONNECTICUT.** One of the New England division of the United States and one of the thirteen original States. It has an area of 4990 square miles, of which 4845 square miles are land and 145 are water. Its capital is Hartford.

#### AGRICULTURE — CONNECTICUT CROP PRODUCTION

a Tons.

b Pounds.

**POPULATION.** The population of the State in 1910 according to the Thirteenth Census was 1,114,756, as compared with 908,420 in 1900, and 746,258 in 1890. The gain in the decade from 1900 to 1910 was 22.7 per cent. The State ranks thirty-first in point of population, whereas in 1900 it ranked twenty-ninth. The population of the larger towns and cities will be found in the tables in the article UNITED STATES CENSUS.

**EDUCATION.** The number of children between the ages of 14 and 16 in the State in the school year 1909-10 was 242,662. The average attendance was 147,190. The average enrollment was 190,353. The average monthly salary of men teachers was \$123, and of women teachers, \$54.51. The legislature of 1909 passed a number of important measures relating to education. Among these was an act providing that no certificate of age shall be given to any child under 16 years of age unless such child shall be able to read with facility, to write simple sentences in the English language and perform the operations of the fundamental rules of arithmetic up to and including fractions. It is provided, however, that foreign-born children may be given a certificate if over 14 years of age and if they have had an equivalent education in their native language. Measures were also passed providing for the establishment of trade schools in two towns of the State. Each town is required to furnish by transportation and otherwise school accommodations so that every child over 7 and under 16 years of age can attend school.

#### POLITICS AND GOVERNMENT

There was no session of the legislature in 1910, as the sessions are biennial, and the last was held in 1909. The session for 1911 opened January 8th.

**CONVENTIONS AND ELECTIONS.** The Democratic State convention was held September 8th. Simeon E. Baldwin, former chief justice of the State, was nominated with practical unanimity for governor. The platform declared in favor of the income tax amendment, for the popular election of Senators, for the control of public utilities, abolition of the \$5000 death limit, compensation act for workmen, direct primaries, strengthening the corrupt practices act and civil service rules for State employees. The Republican convention was held on the 14th and concluded a very active canvass for the nomination between Charles A. Goodwin, former private secretary to Governor Lilly, and Lieutenant-Governor Everett J. Lake, both of Hartford. Each side entered the convention confident of success. There were 580 delegates. On the first ballot Goodwin had 295 votes and Lake 285, and then the claim was made that extra ballots were found under the counters' table. After some contention a second ballot was taken which resulted in: Goodwin, 318; Lake, 259. The Republican platform gave the administration of President Taft a strong endorsement, pointed to a reduction of two and three-quarters millions in the State debt by successive Republican administrations, declared for the control of public utilities, the abolition of the \$5000 death limit, the employers' liability act, strengthening the veto of the governor which can now be overturned by a majority vote, and for a redistricting of the State to get rid of the anomalous condition of Congressmen-at-Large. The ill-feeling developed through the

convention lasted through the campaign, and Baldwin was elected governor by a plurality of 3980 over Goodwin. All the other Republican candidates on the State ticket were elected by pluralities ranging from 4669 to 6574. As Congressmen, Tilson was re-elected at large by 6265, as against 41,528 in 1908; Henry, in the First District, by 1235, as against 11,235; Higgins, in the Third District, by 78, as against 5745 (and his election was contested); Hill, in the Fourth District, by 2843, as against 13,420. In the Second District, Thomas L. Reilly, Democrat, defeated A. N. Shepard by 3012, as against a Republican plurality two years earlier of 9257. An interesting detail of the election was that the Socialist vote for governor rose from 4827 in 1908 to 12,179, while the Prohibition vote fell from 2597 to 1811. The total vote cast for governor on all tickets was 22,886 less than two years earlier. During the campaign a lively controversy developed between Judge Baldwin and ex-President Roosevelt, in the course of which the former threatened to sue the latter, but he afterwards announced that he had no such intention. In the different counties the Republicans elected their sheriff, in Hartford, New London, Middlesex and Windham counties, and the Democrats elected theirs in New Haven, Fairfield, Litchfield and Tolland counties.

**STATE OFFICERS.** Governor, Simeon E. Baldwin; Lieutenant-Governor, Dennis A. Blakeslee; Secretary of State, Matthew H. Rogers; Treasurer, Costello Lippitt; Auditors, William P. Bailey and Edward S. Roberts; Comptroller, Thomas D. Bradstreet; Attorney-General, John H. Light; Commissioner of Agriculture, Governor *ex-officio*; Superintendent of Education, Charles D. Hine; Commissioner of Insurance, Theodore H. Macdonald—all Republicans except Governor.

**JUDICIARY.** Supreme Court: Chief Justice, Frederick B. Hall, Republican; Associate Justices, S. O. Prentice, Republican; George W. Wheeler, Democrat; John M. Thayer, Democrat; Alberto T. Roraback, Republican; Clerk, George A. Conant.

**STATE LEGISLATURE, 1911.** Senate, Republicans, 21; House, 159; Joint Ballot, 180. Democrats, Senate, 14; House, 97; Joint Ballot, 111. Republican majority, Senate, 7; House, 62; Joint Ballot, 69.

**CONNOR, RALPH.** See LITERATURE, ENGLISH AND AMERICAN, Fiction.

**CONSERVATION.** The subject of conservation received as much attention in 1910 as in 1909, although there was perhaps less violent discussion. The political aspects were less prominent, pending the investigation of the Congressional Committee appointed to examine into the Ballinger-Pinchot affair. The results of this investigation will be found in the article UNITED STATES, in the section on History. There also will be found an account of the deposition of Mr. Pinchot as Chief Forester and the events which led up to that action by President Taft. The withdrawal of public lands of various classes from entry as a result of the passage of new laws relating to conservation will be noted under the title PUBLIC LANDS. (See also FORESTRY.) The present article is a résumé of the most important events dealing with the subject of conservation as distinct from its directly political aspects.

**WHAT IS CONSERVATION?** Conservation of the

natural resources of the country as a popular movement began with a Conference of Governors, held in Washington, May 13-15, 1908. As a result of this meeting President Roosevelt on June 8, 1908, appointed a National Conservation Commission. This commission held a meeting during the first week in December in 1908, at which an inventory of the resources of the country was discussed. During the same month this inventory and report were considered at a joint conference of State and national commissions, and commissions or committees appointed by national organizations. This joint conference approved and supplemented the report of the commission which was submitted to President Roosevelt and was by him in January, 1909, transmitted to Congress with a message signifying his approval. This inventory, comprising two large volumes, is probably the most complete quantitative statement of the natural resources ever prepared for any country.

At the joint conference in December President Roosevelt was authorized to invite Canada and Mexico to unite with the United States in a movement for taking stock of the natural resources of the North American Continent. This invitation was accepted and each country designated three commissioners to meet at Washington with a like number of American commissioners on February 18, 1909. This meeting was called the North American Conservation Conference. It was signally harmonious and resulted in many important recommendations. An especially noteworthy feature of this conference was the unanimous opinion that the time had now come for rendering the conservation movement world-wide in scope. When this opinion was submitted to President Roosevelt he promptly responded by addressing invitations to all civilized nations to join in a conference devoted to the consideration of the world's natural resources, to be held at The Hague at such date as might be found convenient.

The Sixtieth Congress, during its closing days, refused to continue the appropriation for the National Conservation Commission. This body thereupon went out of existence. A statement of principles, prepared by the Conference of Governors, May 13-15, 1908, was as follows:

"We do hereby declare the conviction that the great prosperity of our country rests upon the abundant resources of the land chosen by our forefathers for their homes, and where they laid the foundation of this great Nation.

"We look upon these resources as a heritage to be made use of in establishing and promoting the comfort, prosperity, and happiness of the American People, but not to be wasted, deteriorated, or needlessly destroyed.

"We agree that our country's future is involved in this; that the great natural resources supply the material basis on which our civilization must continue to depend, and on which the perpetuity of the Nation itself rests.

"We agree that this material basis is threatened with exhaustion.

"We agree that the land should be so used that erosion and soil-wash shall cease; that there should be reclamation of arid and semi-arid regions by means of irrigation, and of swamp and overflowed regions by means of drainage, that the waters should be so conserved and used as to promote navigation, to enable the arid regions to be reclaimed by irrigation, and to develop power in the interests of

the people; that the forests which regulate our rivers, support our industries, and promote the fertility and productiveness of the soil should be preserved and perpetuated; that the minerals found so abundantly beneath the surface should be so used as to prolong their utility; that the beauty, healthfulness, and habitability of our country should be preserved and increased; that the sources of national wealth exist for the benefit of the People, and that monopoly thereof should not be tolerated.

"We declare our firm conviction that this conservation of our natural resources is a subject of transcendent importance, which should engage unremittingly the attention of the Nation, the States, and the People in earnest co-operation.

"We agree that this coöperation should find expression in suitable action by the Congress and by the legislatures of the several States.

"Let us conserve the foundations of our prosperity.

"We, therefore, form this Association to advocate and support the adoption by the people themselves and by their representatives of definite and practical measures to carry the foregoing principles into effect, and to oppose in all appropriate ways all action which is in conflict with these principles, whether such action is attempted by individual citizens or by legislative or administrative officials. Among such measures are the following:

"The protection of the source waters of navigable streams, through the purchase or control by the Nation of the necessary land within their drainage basins, especially in the Southern Appalachians and the White Mountains.

"The enactment and enforcement, both by the Nation and by the several States, of effective laws to prevent, by active patrol during dry weather, and by other appropriate means, the spreading of fire in all forests, whether publicly or privately owned.

"The reasonable but effective public regulation of timber cutting on forest land, whether publicly or privately owned, the conservation of which is essential to the public welfare.

"The separation, for purposes of taxation, of the timber from the land on which it grows, so that the forest crop shall be taxed only when it is harvested, while the land shall be taxed every year.

"The support and extension of practical forestry.

"WATERS. The preparation, by a Commission appointed by the President of the United States, of a comprehensive plan for waterway improvement, extending to all the uses of the waters and the benefits to be derived from their control, including navigation, with the relation of railroads and terminals thereto, the development and disposition of water power, the irrigation of arid lands, the drainage of swamp and overflowed lands, the control of floods, the prevention of soil-wash, and the purification of streams for water supply.

"The immediate undertaking and continuous prosecution of works clearly necessary under such general plan.

"The incorporation into all future grants of water-power rights by State or Nation of provisions to secure the following:

"(a) Prompt development, on pain of forfeiture of the grant.

"(b) Payment of reasonable compensation

for the benefits granted by the people, with periodic readjustment of the rate of compensation, so as to insure justice both to the investor and to the public.

"(c) The limitation of all such grants to periods not exceeding fifty years, and the reservation of the right to terminate and acquire or reconvey the grant for proper cause and upon equitable compensation; together with proper inspection and publicity of records and accounts.

"(d) Recognition of the right of the appropriate public authorities to make reasonable regulations as to rates of service.

"The termination of all existing permits or grants for the development of water power and the substitution of new grants involving the foregoing principles as soon and to such extent as may be consistent with the terms of the existing grants.

"The support and extension of the irrigation of arid lands and the drainage of swamp and overflowed lands.

"LANDS. The directing of public attention to the need for preserving the fertility of our soils, and thus protecting the future food supply of our people.

"The enactment of legislation whereby the title to the surface of public lands and to the minerals therein shall be granted separately, with every appropriate facility to miners to acquire such part of the surface as may be needed in the development of their claims.

"The conservation and control of the unappropriated public range lands by the government in the interests of the stockman and homemaker, and subject at all times to homestead entry.

"MINERALS. The retention by the government of the title to all lands still in public ownership which contain phosphate rock, coal, oil, or natural gas, and the development of the same by private enterprise, under conditions that will prevent extortion and waste.

"The enactment of appropriate legislation to prolong our coal supply, to reduce waste in mining, and to establish sufficient safeguards against the loss of life in mines.

"We desire to further all legislation which is wisely designed to diminish sickness, prevent accidents and premature deaths, and increase the comfort and joy of American life, believing that human efficiency, health and happiness are natural resources quite as important as forests, waters, lands and minerals.

"The foregoing enumeration is intended to indicate the general character of some of the measures which this organization believes should be adopted to carry the principles of conservation into practical effect. It will, however, cooperate in every appropriate way with other organizations and with the development of our natural resources, and to bring to this cooperation the vigorous support of an intelligent and disinterested citizenship."

CONSERVATION IN 1910. The National Conservation Association which was organized in 1909 under the presidency of Charles W. Elliot continued an active propaganda in 1910. Gifford Pinchot, following his deposition as Chief Forester, was elected president of the association early in 1910. Mr. Pinchot at once began an active campaign and immediately following his retirement as Chief Forester issued a statement in which he criticised Congress for refus-

ing to continue the National Conservation Commission and declared that unless immediate congressional action was taken the water powers of the country would pass into the hands of special interests without charge and without limit of time. The same he declared would be true of phosphate deposits and with the coal deposits in Alaska. He asserted that in the absence of proper legislation, two great conservation plans for the public welfare might fail. The first was the control of water powers of navigable streams in the public interests and the second was the construction of a deep waterway from the Great Lakes to the Gulf. (See WATERWAYS.) "The first great immediate danger," he said, "is that water powers will be lost, and the second is that the coal lands will be lost, but these specific dangers of public loss are merely parts of the great issue between the special interests and the rest of us."

Mr. Pinchot's statement was issued on the same day on which President Taft sent to Congress his expected message on conservation. The President made it plain that he did not differ materially from President Roosevelt in his views on the subject. He showed, in addition, that he had a specific and progressive programme which he presented to Congress. He pointed out that in 1860 the public domain included 1,065,911,288 acres, which had at the present time been reduced to 731,354,081 acres, not including Alaska. This area is confined largely to the mountain ranges and the arid and semi-arid plains. After pointing out the lax methods that had formerly prevailed in distributing these lands he said that in recent years there had developed a deep concern in the public mind regarding the preservation and proper use of our natural resources. To President Roosevelt he gave the credit for beginning the investigation into the violation of the public land law, and the prosecution of land frauds which had been vigorously continued under his own administration. His recommendations for legislation, which he declared that he believed would go far toward the solution of many of the difficult problems, related to the administration of public lands, to improvement of water power sites and coal lands, to irrigation projects and to inland waterways. He urged the immediate prosecution of plans for the deepening of the Ohio River and the Upper Mississippi River in the northwest, he advocated the passage of an act permitting a \$30,000,000 bond issue, while for the proper disposal of the public lands and prevention of water power monopoly, he recommended the enactment of bills prepared by the Secretary of the Interior.

The bills prepared by Secretary Ballinger were nine in number and they were introduced in Congress on January 18th. The most important of these was the one which gave clear authority to the Executive to guard the public domain by the withdrawal of lands. This bill was to give the President power by Congress to perform those acts which Mr. Roosevelt had carried into effect by executive action. His authority to do this had been questioned and to the criticisms of this action was largely due the political agitation which went on in the latter part of 1909. This bill had the support of Mr. Pinchot and the National Conservation Association. The second bill related to coal lands and the third to phosphate, oil, asphalt and natural gas lands. These bills separated the surface

of the land from the underlying minerals and provided for the disposal of minerals by lease and not by sale. A fourth bill dealt with water power sites and the fifth with reclamation projects. The latter permitted the sale of land to any persons except actual residents or occupiers of the reclaimed land. Still another bill was one providing for the sale of timber lands and another for classifying public lands. Of these bills the last three were strongly criticised by Mr. Pinchot, for various reasons.

**CONGRESSIONAL LEGISLATION.** All the bills recommended by the President were passed, although some in changed and modified form. He was authorized "at any time in his discretion to temporarily withdraw from settlement, location, sale or entry any of the public lands of the United States . . . and reserve the same for water power sites, irrigation and other public purposes." The withdrawals remained effective until revoked by the President or by Congress, but the lands withdrawn are open to exploration and to the purchase of minerals other than coal, oil, gas and phosphate. The withdrawals do not affect bona fide occupants or claimants who are diligently prosecuting work on such lands at the time of the passage of the act and no additions to the forest reserves are to be made in Oregon, Washington, Idaho, Montana, Colorado or Wyoming, except by act of Congress. A measure was passed authorizing certificates of indebtedness to the amount of \$20,000,000 for the purpose of completing existing reclamation projects. This was \$10,000,000 less than the President asked for in his message. An act was passed expressly authorizing the reservation of power and reservoir sites for Indian reservations. The Act for admitting New Mexico and Arizona as States makes similar reservations upon lands granted to the new States. A bill for the purchase of the Appalachian and White Mountain national forests passed the House but was not acted upon in the Senate. An agreement was reached, however, by which this measure will be finally voted on in the Senate on February 15, 1911.

**STATE LEGISLATION.** The conservation of natural resources has occupied legislative attention in the States for several years. As a result of the Conference of Governors early in 1908 many States have appointed national conservation commissions. The only State added to this list in 1910 was Maryland. This commission is made up of three unpaid members who are to study the problem of conservation, cooperate with conservation boards of other States and with the Federal government and to prepare publications on the subject. The only other legislation of similar character during the year was in New York, where the Forest, Fish and Game Commission received an appropriation to purchase and propagate trees to reforest lands in the forest reserves.

**CONSERVATION CONGRESS.** The second Conservation Congress was held in St. Paul, Minnesota, in the first week in September. There was in attendance a notable company of statesmen, business and professional men. Additional interest and importance was given to the meeting by the fact that President Taft and Mr. Roosevelt both made addresses. This afforded an opportunity for comparing the theories on conservation held by each. The President's address was given on September 5 and Mr. Roosevelt's on the follow-

ing day. The President's address was a calm, dispassionate summary of the whole question of conservation with an outline of the measures which he deemed it necessary to take for the best interests of the movement. He unequivocally praised certain measures taken by Mr. Roosevelt, but did not hesitate to criticize some of the conservation policies of the latter's administration. To the important question whether the water power sites should be controlled by the general government or by State governments Mr. Taft did not give a positive opinion. He said, however, that he would submit the matter to Congress and urge that one or the other of the two plans be adopted. He stood out clearly, however, in his demand for a clear recognition of the rights of the States in the disposal of any reserves. Upon this policy he differed directly from President Roosevelt, who on the next day made a ringing plea for the "new nationalism" and denounced the whole argument of State's rights as an invention of those selfish interests with whose predatory purpose the conservation movement had interfered. This was practically the only point on which the theories of President Taft and Mr. Roosevelt in regard to the general subject of conservation differed. The platform of the Congress as finally adopted contained a specific declaration in favor of the policy of national control. The Congress elected Henry Wallace as its president, Mr. Pinchot having declined in the interest of harmony to accept another term of office.

**NATIONAL CONSERVATION ASSOCIATION.** The association during the year followed the progress of conservation legislation closely and offered constructive suggestions which yielded excellent results. Largely through its efforts the principle of the separate disposal of the surface of public lands and the underlying mineral fuels was applied, by act of Congress, to all withdrawn coal lands. The principle of the withdrawal of public lands so as to provide for their disposal in the interest of the people has been expressly recognized by Congress. The association heartily supported the measure for the establishment of a National Bureau of Mines.

Measures which in its opinion violated the principles of conservation were vigorously opposed by the association. Among those in which this opposition was successful were the Smoot Bill, which proposed to turn over to the States all the water power sites owned by the Federal government, and the James River Dam License Bill, which was vetoed by President Roosevelt during the previous session of Congress, but was reintroduced. In conjunction with experienced engineers in water power development and representatives of hydro-electric water power companies, the association, through its counsel, proposed an outline of water power policy for application both in the States and in the Federal government.

During the year the association perfected its organization and systematized its work. Many pamphlets relating to conservation were issued during the year.

**COOK, JOEL.** An American Congressman and writer, died December 15, 1910. He was born in Philadelphia in 1842 and was educated in the public schools in that city. He studied law and was admitted to the bar in 1863. Adopting journalism as a profession he acted as war correspondent of the Army of the Potomac in 1862-3. He accompanied McClellan on the Peninsular Campaign, of which he wrote a history, *The Siege of Richmond* (1865). He afterwards became Washington correspondent of the Philadelphia Press and was present as correspondent at the battles of Antietam and Gettysburg. He made two tours of Europe, of which he wrote descriptive letters; some of which were afterwards published in book form under the title *A Holiday Tour in Europe*. He was identified with trade interests in Philadelphia and frequently appeared before Congress and legislative committees to advocate legislation advantageous to those interests. He was at one time President of the Philadelphia Board of Trade and was a member of the Board of Public Education. He was elected to Congress in 1907 and was re-elected in 1908. In addition to the works mentioned above he was the author of *An Eastern Tour at Home; England, Picturesque and Descriptive; America, Picturesque and Descriptive; France, Switzerland and the Rhine, and A Visit to the States*.

**COOPER, EDWARD HERBERT.** An English novelist, died May 26, 1910. He was born in Trentham, and was educated at the University College, Oxford. His novels of racing and sporting life are notable. Among his published works are: *Geoffrey Hamilton* (1893); *Monk Wins* (1901); *A Fool's Year* (1901); *George and Son* (1905) and *The End of the Journey* (1908).

**COOPER UNION FOR THE ADVANCEMENT OF SCIENCE AND ART.** An institution founded in New York City in 1857 by Peter Cooper for free instruction in science and art. The institute includes the following departments: Night school of science; night school of art; day school of technical science; women's art school; school of stenography and typewriting for women; school of telegraphy for women; debate and elocution; and civics and

economics. The total enrollment in all these departments in 1910 was 3404. This represents the total capacity of the present building occupied by the institute. It has over 4000 applications for admission annually in excess of the accommodations. A site has been purchased directly opposite the present building in Cooper Square, but funds have been lacking for construction. During the year 1909-10 the attendance was distributed as follows: Night school of science, 1329; night school of art, 1334; woman's art school, 220; school of stenography and typewriting for women, 51; school of telegraphy for women, 30; debate and elocution, 225; civics and economics, 90. The total revenue from the State amounts to about \$80,000 a year and the expenditure to about \$90,000. The endowment is about \$4,000,000. The officers in 1910 were: President, John E. Parson; Secretary, R. Fulton Cutting, and Treasurer, Edwin R. Hewitt.

**COPPER.** The production of copper in the United States in 1909 exceeded the production of any other year in the history of the industry. It surpassed the production of 1908 by 150,380,903 pounds or 15.95 per cent. The table below, compiled by the United States Geological Survey, gives the production of copper in the United States by States in 1908 and 1909:

PRODUCTION OF COPPER IN UNITED STATES

(Smelter output in pounds fine).

	1908.	1909.
Alaska .....	4,438,836	4,057,142
Arizona .....	289,523,267	291,110,298
California .....	39,643,825	53,568,708
Colorado .....	13,943,878	11,485,631
Idaho .....	7,256,086	7,096,132
Massachusetts .....	7,863	.....
Michigan .....	222,289,584	227,005,923
Montana .....	252,503,651	314,858,291
Nevada .....	12,241,372	53,849,281
New Mexico .....	4,991,351	5,031,136
North Carolina .....	29,391	120,451
Oregon .....	271,191	245,403
Tennessee .....	19,710,103	19,207,747
Utah .....	71,370,370	101,241,114
Virginia .....	25,087	231,971
Washington .....	162,201	120,611
Wyoming .....	2,416,197	433,672
Maryland .....	.....	.....
Alabama .....	.....	.....
South Carolina .....	30,488	.....
Texas .....	.....	3,456
South Dakota .....	.....	41,988
Pennsylvania and New Hampshire .....	135,139	1,083,033
Missouri and unapport'd .....	1,580,831	2,159,636
	942,570,721	1,092,951,624

The total production of new refined copper in 1909 was 1,391,021,454 pounds and this also was the largest output in the history of the industry, exceeding that of 1908 by 253,059,046 pounds. Of this, 1,065,564,921 pounds were of domestic origin and 325,456,533 pounds of foreign origin. Figures for Lake copper include 31,500,113 pounds of Lake copper that was electrolytically refined. In addition to the amount produced from primary sources the regular refining plants recovered 14,598,065 pounds from secondary sources, making a total output of 1,405,619,599 pounds for these plants. If this is added to the output of the regular refineries the contribution of the United

States to the world's supply of copper is found to be 1,480,467,686 pounds.

According to figures compiled by the *Engineering and Mining Journal*, the production of copper in 1910 was 1,445,000,000 pounds. This figure is based on the report of the Copper Producing Association for the first eleven months of the year to which have been added an estimate for December. The production of copper in the United States by States in 1910 was as shown in the accompanying table taken from the same source:

PRODUCTION OF COPPER IN THE UNITED STATES  
(In Pounds).

State.	1910.
Alaska .....	5,450,000
Arizona .....	297,081,605
California.....	45,141,043
Colorado.....	8,867,401
Idaho.....	5,317,039
Michigan.....	219,000,000
Montana.....	288,449,425
Nevada.....	63,778,000
New Mexico.....	5,700,000
Utah.....	127,906,115
Wyoming.....	200,000
Southern States and East .....	17,039,356
Other States .....	2,176,443
Total.....	1,086,161,430

During 1907 and 1909 the consumption of copper in the world was less than the production and as a consequence stocks accumulated until at the end of 1909 the available supply amounted to about 386,000,000 pounds. During 1910 the consumption overtook the production. The *Engineering and Mining Journal* estimates that while the consumption increased about 10 per cent., the production decreased by 2 per cent., and the total supply in 1910 had been decreased to 307,000,000 pounds. In Europe the increased consumption was due chiefly to increased activity in electrical branches. In the United States, owing chiefly to the scarcity of capital, large enterprises could not be financed. In spite of this, however, the consumption of copper increased and it was remarkably large in view of the general depression in trade, particularly in the iron and steel business during the year. This condition reflects a constantly increasing demand in the way of electrical conveniences in the building trade.

The world's production of copper in 1909 and 1910 is indicated in the following table, which was compiled by the *Engineering and Mining Journal* from various sources.

WORLD'S PRODUCTION OF COPPER  
(In Metric Tons).

Country.	1909.	1910.
United States .....	501,372	492,675
Mexico.....	57,230	59,769
Canada.....	21,620	22,865
Cuba.....	3,006	3,529
Australasia.....	34,952	43,000
Chile.....	42,726	41,500
Peru.....	16,257	20,500
Japan.....	42,987	41,000

New York, cents per pound. Electrolytic is for cakes, ingots or wire bars. London, pounds sterling, per long ton standard copper.

According to the Bureau of Statistics, imports of copper including all varieties for the first eleven months of 1910 amounted to 255,237,942 pounds, and the total imports for the year were estimated at 338,000,000 pounds as against 321,801,114 pounds in 1909. Estimates from the same source indicate that the exports of copper during the year may reach 700,000,000 pounds as compared with 681,846,726 pounds in 1909. See ATOMIC WEIGHTS.

COPPER RIVER BRIDGE. See BRIDGES.

**COPYRIGHT.** During 1910 the Berlin International Copyright Convention came into force; the new British consolidated Copyright Bill was introduced, and the Pan-American Copyright Convention (ratified by the Senate, February 15, 1911) was signed by the United States and by all of the Latin-American countries. These significant copyright movements are summarized under the heading INTERNATIONAL COPYRIGHT. They give new importance to the "Act to amend and consolidate the acts respecting copyright" under which copyright is secured in the United States, and as this Act has not heretofore been dealt with a detailed analysis of its provisions is supplied here.

This Act, which went into effect on July 1, 1909, brought about a fundamental change in our law, in providing that copyright is secured by publication of the copyrightable work with the statutory notice. This Act further provides, however, that copyright may also be obtained for certain works, when not reproduced in copies for sale, upon the deposit for registration in the Copyright Office of one complete copy in the case of photograph, drama, musical composition, or lecture; or of a photograph or other identifying reproduction in the case of a work of art, plastic work, or drawing; but whenever such works are afterwards published, a second deposit and registration is obligatory.

**COPYRIGHT INCLUDES** all the "writings of an author," classified by the Act as follows: (a) books; (b) periodicals, including newspapers; (c) lectures, sermons and addresses; (d) dramatic or dramatico-musical compositions; (e) musical compositions; (f) maps; (g) works of art, models or designs for works of art; (h) reproductions of a work of art; (i) drawings or

plastic works of a scientific or technical character; (j) photographs, and (k) prints and pictorial illustrations. Works published before July 1, 1909 (not already copyrighted), and publications of the United States government cannot obtain copyright protection.

Copyright secures the exclusive right (1) to print, reprint, publish, copy, and vend the copyrighted work; (2) to translate, dramatize, arrange or adapt it; (3) to deliver a lecture or other oral work in public for profit; (4) to perform or publicly represent a drama; and, if unpublished, to vend any manuscript or record thereof, or to make any transcription or record and represent or reproduce it; (5) to convert a drama into a novel; (6) to finish a model or design for a work of art, and (7) to perform publicly for profit a musical composition, or "to make any arrangement or setting of it or of the melody of it in any system of notation or any form of record in which the thought of an author may be recorded and from which it may be read or reproduced." But this right includes only music published and copyrighted after July 1, 1909; and music by a foreign author or composer only when the foreign state or nation of which he is a subject grants to citizens of the United States similar rights; and whenever the owner has used or permitted the use of his work for mechanical reproduction (notice of which must be filed in the Copyright Office), any other person may make similar use of it upon payment of two cents on each mechanical part manufactured. If required, a monthly report must be furnished under oath of the number of such parts manufactured, and upon failure to pay the royalties due, the court may enter judgment, in addition to the royalties, not to exceed three times such amount.

COPYRIGHT MAY BE SECURED by the author or proprietor of a work, or his executors, administrators, or assigns; by an alien author when he is domiciled within the United States at the time of the first publication of his work, or when the foreign state or nation of which he is a citizen or subject grants to citizens of the United States copyright on substantially the same basis as to its own citizens, or substantially equal to the protection secured to such foreign author by our laws or by treaty. The citizens of Austria, Belgium, Chile, China, Costa Rica, Cuba, Denmark, France, Germany, Great Britain, Guatemala, Honduras, Italy, Japan, Luxembourg, Mexico, the Netherlands, Nicaragua, Norway, Portugal, Salvador, Spain, and Switzerland may secure the rights accorded by the Act of 1909, upon compliance with its requirements. On February 15, the Senate agreed to the ratification of the fourth Pan-American Copyright Convention.

NOTICE OF COPYRIGHT must be affixed to each copy of the work published or offered for sale in the United States (excepting books registered for *ad interim* protection) to consist of the word "copyright" or the abbreviation "copr.," and the name of the copyright proprietor, and (if a book, musical or dramatic work) the year of publication; but maps, reproductions of a work of art, photographs, prints and pictorial illustrations, and published drawings or plastic works, may be copyright, accompanied by the initials, monogram, mark, or symbol of the copyright proprietor, provided his name appears on some accessible portion of the work, or on the margin, mount, back, permanent base or pedes-

tal. Printing, altering, or removing such notice, with fraudulent intent; or selling or importing any uncopyrighted article bearing a copyright notice is punishable by a fine of from \$100 to \$1000.

DEPOSIT OF COPIES. After publication two complete copies of the best edition must be "promptly" deposited in the Copyright Office, or one copy of the issue or issues of a periodical containing a copyright contribution, accompanied in each case by an application for registration. The postmaster, if requested, must give a receipt for the copies and mail them without cost.

In default of this required deposit, no action or proceeding can be maintained for infringement of copyright, and the Register of Copyrights may at any time after publication demand the copies. Failure to then comply within the statutory period imposes a fine of \$100 and twice the price of the work, and the copyright becomes void.

AMERICAN MANUFACTURE. Foreign books in the English language (not for the use of the blind or claiming *ad interim* protection) and all books by citizens of the United States must be printed and bound in the United States and when deposited in the Copyright Office must be accompanied by an affidavit to that effect. A false affidavit involves a fine of not more than \$1000 and the forfeiture of the copyright. Dramatic compositions do not require to be printed in the United States, while periodicals must be so printed, but no affidavit is required. *Ad interim* copyright may be secured for a book printed abroad in the English language, upon the deposit in the Copyright Office (not later than 30 days after its publication abroad) of one copy for registration. If within the 30 days' *ad interim* protection from registration thus secured an authorized edition of such books is published in the United States in accordance with the manufacturing provisions, and two copies are promptly deposited for registration, the copyright is extended to the full term.

LITHOGRAPHS OR PHOTO-ENGRAVINGS, either when published separately or as illustrations within a book, must be produced by a process wholly performed within the limits of the United States, except when the subjects represented are located in a foreign country and illustrate a scientific work, or when the prints are reproductions of works of art.

IMPORTATION IS PROHIBITED of any *piratical* copies, and of *authorized* copies of books in the English language not printed in the United States, as well as of plates of such books not made from type set, or by lithographic or photo-engraving process performed in the United States, except: (1) works for the use of the blind; (2) newspapers or magazines; (3) books imported for the United States; (4) books imported (one copy), for use and not for sale, by societies or institutions incorporated for educational, literary, or religious purposes, or by public libraries; (5) books purchased *en bloc* for the use of such societies or libraries, or when imported in the personal baggage of persons arriving from foreign countries and not intended for sale, and (6) books imported not more than one copy at one time, for individual use and not for sale; not including, however, copies of a foreign reprint of a book by an American author copyrighted in the United States.

Copyright endures for a first term of 28 years from publication, and may be renewed for 28 years (in lieu of 14 years under the old law) in behalf of the original copyright proprietor in the case of posthumous works, periodicals, cyclopædias, or works copyrighted by corporate bodies (not as assignees of individual authors) or by employers for whom the works were made for hire. The copyright in other works (including contributions by individual authors to periodicals or cyclopædias) may be renewed for the second term, and the copyright subsisting in any work when the Act went into effect may be extended to the full term secured by the Act, in behalf of the author if still living, or the widow, widower, or children of a deceased author; or if none of these are living, then by the author's executors, or next of kin, provided application therefor has been duly registered in the Copyright Office within one year prior to the expiration of the existing term. The proprietor of a composite work may renew and extend the subsisting copyright in such work if it was originally secured by such proprietor.

**ASSIGNMENT.** Copyright is distinct from the property in the material object copyrighted, and the transfer of one does not imply the transfer of the other. Copyright may be assigned, granted, mortgaged or bequeathed. Every assignment of copyright must be recorded in the Copyright Office within three months, if made in the United States, or within six months, if executed abroad.

**INFRINGEMENT OF COPYRIGHT** is liable to injunction and settlement for actual damages and profits, or, in lieu thereof, payment as follows: (1) for a painting, statue, or sculpture, \$10 for every infringing copy; (2) for every other copyright work, \$1 for every infringing copy; (3) for a lecture, etc., \$50 for every infringing delivery; (4) for a dramatic or dramatico-musical or a choral or orchestral composition, \$100 for the first, and \$50 for every subsequent infringing performance, and (5) for other musical compositions, \$10 for every infringing performance. Damages are not to exceed \$5000 nor be less than \$50, and are not to be regarded as a penalty. Willfully and for profit to infringe copyright, or to aid or abet such infringement is a misdemeanor, punishable by imprisonment for not exceeding one year or a fine of from \$100 to \$1000, or both. No criminal action can be brought for infringement of musical copyright by the unauthorized manufacture, use or sale of parts of mechanical music-producing machines, but in a civil action an injunction may be granted, and a royalty of two cents on each such part may be recovered.

**JURISDICTION.** Copyright cases are originally cognizable by the circuit courts of the United States, the district court of any territory, the Supreme Court of the District of Columbia, the district courts of Alaska, Hawaii, and Porto Rico, and the courts of first instance of the Philippine Islands, and may be reviewed on appeal or writ of error. Criminal proceedings must be commenced within three years. Rules and regulations for the practice and procedure in copyright cases have been prescribed by the Supreme Court of the United States as expressly required by the Act of 1909. Chile .....	1,870,380	
New Zealand .....	630,400	

The above figures taken mainly from the Bulletin of Agricultural Statistics, International Institute of Agriculture, Rome, are in part final returns and in part preliminary data.

The crop was good in nearly all countries and the world's production was the largest on record. Drought threatened the crop in the United States, and in parts of central Mexico corn suffered severely as a result of dry weather wherever irrigation was not practiced. In the United States the season of 1910 was one of the most unusual ever experienced. In the spring the weather was unfavorable for a good preparation of the soil and also for planting. This caused much apprehension on account of a comparatively poor stand which resulted. During the growing season many sections were troubled with severely dry weather which reduced the growth and development of an already late crop. When the rains finally came there was much fear of an early frost, and while temperatures went dangerously low at times in the northern sections of the corn belt during the month of September, this month in general was the most favorable for the ripening of a corn crop that most farmers had ever experienced. The crop had matured by the end of September without serious injury from frost. The fall rains and other weather conditions were so favorable that the corn plant made a most marked and rapid development during the latter part of its growing season. The prospects improved in nearly all important corn States as the crop matured. So far were the early setbacks of the crop discounted that the country produced the largest crop on record and for the first time in its history the production went beyond three billion bushels.

**THE UNITED STATES.** The total production of the United States for the year was estimated at 3,125,713,000 bushels grown on 114,002,000 acres, as against a yield of 2,772,378,000 bushels produced on 108,771,000 acres in 1909. The

acreage of 1910 was also larger than that of any other year. The average yield of 27.4 bushels per acre was the largest since 1906. Based on a farm value of 48.8 cents per bushel on December 1, 1910, the total value of the crop amounted to \$1,523,968,000 as compared with a corresponding bushel value of 59.6 and a total value of \$1,652,822,000 in 1909, the record year in this regard. The yields of the principal corn growing States in 1910 were as follows: Illinois 414,812,000 bushels, Iowa 343,870,000, Missouri 273,900,000, Nebraska 206,400,000, Indiana 201,216,000, Texas 181,280,000, Kansas 169,100,000, Ohio 144,540,000 and Kentucky 105,270,000 bushels. The average yield per acre in these States ranged from 19 bushels in Kansas to 39.3 bushels in Indiana. The best average yield in any group of States was secured in the New England States, where the range was from 40 bushels per acre in Rhode Island to 53.2 bushels in Connecticut, which held the record among all the States. A feature of the year was the increase in the total production of the Southern States. The cotton States showed an increase of 120,000,000 bushels and the total production of 14 Southern States reached nearly a billion bushels, or one-third the crop of the entire country.

**IMPROVEMENTS.** The general interest in a larger yield of better corn was more than upheld in 1910. Corn improvement by breeding and selection was continued by the experiment stations, corn growers' associations, and in individual farmers. The importance of good seed corn was the keynote of all extension work in corn culture and more boys' corn clubs growing corn for premiums were in operation than in any year before. A number of large corn shows were held in different parts of the country during the year.

**CORNEILLE, EUGÈNE.** See **NECROLOGY**.

**CORNELL UNIVERSITY.** An institution of higher learning at Ithaca, N. Y., founded in 1868. During the year 1909-10 there was enrolled a total of 5194 students, an increase of 335 over the total attendance for the preceding year. This figure includes students who registered in the summer session and in the short winter session in agriculture. The students regularly registered in courses leading to a degree numbered 4227, distributed as follows: graduate school, 309; arts and sciences, 970; law, 264; medicine, 201; veterinary medicine, 100; agriculture, 539; civil engineering, 559; mechanical and electrical engineering, 1186. The number of members of the instructing staff during the year was 636. Of these the professors numbered 138, assistant professors, 82, lecturers, 5, instructors, 210, and other assistants on the instructing staff, 201. Among the important changes in the faculty of the University during the year were the following: On June 7, Goldwin Smith (q. v.), the oldest emeritus professor of the University, died at Toronto. In June there retired from active teaching the following professors, who were elected to emeritus professorships: Burt Green Wilder, professor of neurology and vertebrate zoölogy; Waterman Thomas Hewett, professor of German language and literature; and Lucien Augustus Wait, professor of mathematics. A number of promotions to professorships were made among the assistant professorships of the University. The donations for the year aggregated \$228,554. The largest item was \$173,000

from Colonel Payne, toward the maintenance of the Cornell University Medical School of New York City. Gifts made during the year included \$50,000 from Andrew Carnegie, to defray the expenses of an addition to Morse Hall of Chemistry. A bequest of about \$700,000 was left the University under the will of Goldwin Smith to be used for the promotion of liberal studies. The total property of the university, including endowments, real estate, etc., on August 1, 1910, was \$15,178,174. The income for the year from all sources amounted to \$1,657,331. Of this income \$281,687 was received from the State of New York for the regular maintenance of State colleges of agriculture and veterinary medicine. The President is J. G. Schurman, LL.D.

**CORRUPT PRACTICES.** "Corrupt practices" legislation is coming to receive a larger share of attention. Corrupt practices refer practically to the purchase of votes, and while there are many practices which induce a voter to vote in one way or another, which are improper in themselves, the corrupt practice which the reformer wishes to get at first is the direct purchase of a vote for money or for some valuable consideration. Six years ago, when this subject first came prominently into mind, the condition of things in the State and in the country at large was almost hopeless. Nobody was paying any attention to corrupt practices at all. "Barrel campaigns," "fat-frying" incidents, shaking the "plum tree," "blocks of five," indicated the existence of a great evil all through the United States. There were some very sensational occurrences in 1904, charges and counter-charges, which called public attention sharply to this matter. Then there came the insurance investigation; then came the celebrated letter of Mr. Harriman stating that just before election he and his friends had distributed some \$260,000, which had a "decided influence" on the campaign. Those things sank deep into the popular mind, and then Mr. Perry Belmont printed in the *North American Review* a very interesting and competent article on the subject of the use of money in elections. About the same time the "Association to Prevent Corrupt Practices at Elections" was formed in New York. That Association brought about some statutory changes. It put a real corrupt practices act upon the statute books of the State, and it has since been engaged in an endeavor to enforce the act.

In England the principle of the Corrupt Practice Act places a premium on the enforcement of the act. It does away with the election won by such method. The result is that in a bitterly contested election in England, the parties watch with hawk-like eyes the attitude of their antagonists, and as soon as a man is guilty of any corrupt practices, the opposition party, from no patriotic motives, but from selfish reasons, at once makes an attack, and if successful in proving corrupt practices, the person against whom they are proven, or against whose agent they are proven, is ousted from office and

a new election is held. Not only is the person found guilty ousted from office, but he is ineligible to hold office for five years thereafter. The result of that is that it brings to bear upon this subject a tremendous pressure.

The difficulty of applying that system to this country, in the opinion of Wm. Church Osborn, who has given the subject close attention, lies in the fact that, whereas in England they have but one candidate upon a ticket, we have perhaps 15 or 20, and it would be obviously absurd to attempt to apply to the election of a president a principle which may affect some election district in a city or some rural district in the northern part of the State. "Where there are many candidates upon a ticket it is impossible to apply that principle in its entirety. In the case of a close election," Mr. Osborn is of the opinion, "the loss of the party vote in a given town might be just sufficient to change the result of that election in the county. It strikes me ethically that it would not be an unfair arrangement for the party to lose in its assembly canvass the vote of a town which had been secured by it by corrupt means."

In 1908 the Library of Congress published a "Select List of References on Corrupt Practices in Elections," compiled by Appleton Prentiss Clark Griffin.

**CORY, G. E.** See LITERATURE, ENGLISH AND AMERICAN, *History*.

**COSTA RICA.** A Central American republic, between Nicaragua and Panama. Capital, San José.

**AREA, POPULATION, ETC.** The area is stated at 18,691 square miles. The census of December 31, 1909, showed a population of 368,780. The principal towns, with population December 31, 1909, are: San José, 29,660; Heredia, 7511; Cartago, 6018; Alajuela, 5861; Limón, 5269; Puntarenas, 4696. On May 5, 1910, Cartago was practically destroyed by an earthquake. In 1908, immigrants numbered 11,789, and emigrants, 9367; births, 15,308; deaths, 9124. Primary instruction is free and nominally compulsory. At the end of 1908 there were 357 primary schools, with 887 teachers and 27,452 pupils enrolled. In 1910 it was reported that there were about 30,000 pupils in average attendance in the primary and 1200 in the secondary schools, with about 1000 teachers. There are some provisions for higher and professional education. The state religion is Roman Catholicism.

**INDUSTRIES AND COMMERCE.** Agriculture is the principal source of wealth. The principal crops are bananas and coffee. Approximate acreages: Bananas, 91,000; coffee, 74,000; corn, 64,000; sugar-cane, 24,000; beans, 17,600; rice, 6600; cacao, 5500.

Imports and exports in 1908 were valued at \$5,677,353 and \$7,762,728 respectively; in 1909, \$6,109,938 and \$8,176,257. The leading imports are cotton textiles, flour, and machinery. Chief exports in 1909: Bananas, \$4,355,045; coffee, \$2,639,873; gold and silver bullion, \$792,847; cattle hides, \$105,020; rubber, \$71,756; cacao, \$55,765. Annual coffee exports (chiefly to Great Britain): 1905, about 18,000 metric tons; 1906, 14,000; 1907, 17,300; 1908, 8978 (small crop on account of excessive rains); 1909, 12,030. The banana export (chiefly to the United States) advanced rapidly for several years prior to 1908; in 1907 it was 10,165,759 bunches; in 1908, about 10,000,000; in 1909, 9,365,690. Im-

ports from and exports to the principal countries have been (in thousands of dollars):

Countries	Imports		Exports	
	1908	1909	1908	1909
United States.....	2,618	3,376	....	4,802
Great Britain.....	1,282	1,115	....	2,945
Germany .....	647	802	....	167

In 1908 there entered the ports (Limón and Puntarenas) 811 vessels of 1,129,210 tons.

**COMMUNICATIONS.** Railways focussing at Limón, and including branches to the banana region, have a trackage of 336 miles. The main line connects Limón with San José (103 miles). In the summer of 1910 all but 12 miles of a line between San José and Puntarenas was finished. Its completion was expected by the end of the year, when through rail communication would be effected between the waters of the Pacific and Atlantic and the total mileage in the republic would be 405. Telegraph lines, 1335 miles. Post-offices (1908), 197.

**FINANCE.** The monetary standard is gold, and the unit of value the colon, worth 46.5 cents. Revenue and expenditure for fiscal years, in thousand of colones:

	1906	1907	1908	1909
Revenue .....	6,211	7,655	7,916	9,281
Expenditure .....	5,914	7,096	9,191	9,281

Estimated revenue and expenditure for 1910, 7,355,534 and 7,286,473 colones respectively. Revenue is derived principally from customs (4,420,567 colones in 1909) and liquors. The largest expenditures are for finance, public instruction, and military and police. Public debt, December 31, 1909: foreign debt, 25,135,489 colones; internal debt, 10,829,091 colones.

**Government.** The executive authority is vested in a president, who is assisted by a cabinet of four members. The legislative power devolves upon a Chamber of Representatives. Both President and Representatives are elected by indirect vote for four years. On May 8, 1910, Ricardo Jiménez was inaugurated President, succeeding Cleto González Víquez.

The army, in which all citizens are liable to serve, is really a police organization and its total strength is maintained at less than 1000. There was in addition a militia of about 12,000. There is one torpedo boat and one gunboat.

**HISTORY.** On March 20, 1910, Costa Rica and Panama signed a protocol setting forth the basis of fact for the arbitration of their boundary dispute by Chief Justice Fuller. In May Ricardo Jiménez was inaugurated as president. An earthquake at Cartago and the vicinity wrecked a large part of the city, including Mr. Carnegie's Palace of Peace, and killed a large number of people. Some reports estimated the loss of life at 1800, most of them residents of Cartago. Thousands of people were left homeless and destitute. See EARTHQUAKES.

**COSTA RICA-PANAMA ARBITRATION.** See COSTA RICA, INTERNATIONAL ARBITRATION.

**COST OF LIVING.** See AGRICULTURE.

**COTTON.** THE UNITED STATES COTTON CROP. The cotton crop produced in 1910 in money value was one of the greatest in the history of cotton production. The estimated crop for 1910-11, according to the United States Department of Agriculture, was 11,426,000 bales

of 500 pounds each, not including linters. On December 30, 1910, the New York market price of middling uplands was 14.95 cents, and at that average rate the entire crop would be worth more than \$854,000,000. The Secretary of Agriculture estimated the farm value of the entire crop, lint and seed, at over \$900,000,000. According to the ginning reports issued by the U. S. Bureau of the Census, on December 13, 1910, there had been ginned 10,698,482 running bales, counting round bales as half bales and excluding linters. This includes 75,170 bales of Sea Island cotton, distributed as follows: Florida, 25,804; Georgia, 39,717; and South Carolina, 9,649 bales. Of the crop of 1909 of 10,072,137 running bales there had been ginned at the same date in 1909, 92 per cent. of the entire crop, or 9,358,085 running bales.

The estimated crop and amount ginned on December, 13, 1910, by States were as follows:

State	Estimated crop. 500 pound bales	Reported ginned. Running bales.
United States	11,426,000	10,698,428
Alabama	1,174,000	1,129,273
Arkansas	815,000	676,156
Florida	58,000	59,488
Georgia	1,750,000	1,707,310
Louisiana	260,000	234,468
Mississippi	1,160,000	1,066,946
North Carolina	675,000	664,434
Oklahoma	900,000	868,928
South Carolina	1,116,000	1,108,967
Tennessee	305,000	269,657
Texas	3,140,000	2,849,911
All others	73,000	62,944

Among the States grouped as "all others" are Missouri, the crop of which is estimated at 48,000 bales; Virginia, with 13,000 bales; and California, which takes rank as a cotton-producing State, with 12,000 bales, most of which was grown in the Imperial Valley and adjacent regions. The cotton crop of the United States for 1909 was 10,363,240 running bales, which includes 94,566 bales of Sea Island and 314,598 bales of linters.

**SEA ISLAND COTTON.** The Sea Island crop of that year was produced as follows: Florida 28,158 bales, Georgia 52,060 bales, and South Carolina 14,573 bales. The continental area devoted to this kind of cotton does not appear to be extending, in fact 5 less counties were reported as producing Sea Island cotton in 1909 than in 1908. A considerable quantity of Sea Island cotton continues to be grown in the West Indies, and the reports from the British Islands for the year ended June 30, 1910, were valued at \$630,000. The exports of Sea Island cotton from Porto Rico during the same period were valued at \$18,150. Experiments with Sea Island and Caravonica cottons are in progress at the Agricultural Station in Hawaii, where the plants are grown as perennials and pruned every year. It has been found that the prunings root readily, and advantage has been taken of this fact to propagate some especially valuable strains. As a result of these experiments a number of planters have taken up cotton growing, and the first commercial shipment of cotton from Hawaii in half a century was made in December, 1910.

**THE WORLD'S CROP.** The world's production

of cotton for mill consumption in 1909 was over 3,000,000 bales less than that of 1908. The distribution of the supply for 1908 and 1909 was as follows:

Country	1909. 500 pound bales	1908. 500 pound bales.
Total	16,558,000	19,613,000
United States	9,863,000	13,002,000
British India	3,602,000	2,953,000
Egypt	911,000	1,275,000
Russia	720,000	846,000
China	600,000	600,000
Brazil	360,000	425,000
Peru	60,000	57,000
Mexico	125,000	140,000
Turkey	32,000	80,000
Persia	90,000	50,000
Other countries	195,000	185,000

According to U. S. Consular Reports the cotton crop of India for 1910 is estimated at 4,502,000 bales and that of Egypt at over 1,200,000 bales. The Egyptian crop continues to be far from satisfactory, and a commission has been appointed to inquire into the causes for the diminishing output per acre.

**DEVELOPMENT OF COTTON GROWING IN FOREIGN COUNTRIES.** In endeavoring to develop cotton growing in their African colonies, the English, German, and French governments are coöperating with industrial associations to a considerable extent. The British government has granted a subvention to the British Cotton Growing Association of \$50,000 a year for three years, contingent upon the association expending \$750,000 in five years. The German government has given \$100,000 to the Colonial Industrial Association for the development of cotton growing in German colonies. According to a recent German report, there had been expended in the British, German, and French colonies in Africa up to 1909 about \$3,000,000 in developing the cotton industry, and the value of the cotton marketed was but \$3,850,000. The production up to 1908 had been: British colonies 37,120 bales of 500 pounds each, German colonies 8772½ bales, and French colonies 1575½ bales, or a total of 47,468 bales of an average value of 15.6 cents per pound. In 1910 the British Cotton Growing Association up to September had received from West Africa 5469 bales, from Uganda 3000 bales, and from East Africa 1415 bales, and the crop conditions for Rhodesia and Nyassaland were considered very favorable. A recent report from Peru states that about 125,000 acres of irrigated land are devoted to cotton, and the crop of 1910 is estimated at 100,000 bales. About 65 per cent. is the American upland type of cotton, the balance rough Peruvian with a little Sea Island and Egyptian. An experiment station for cotton growing has recently been established in that country. According to Japanese sources there were over 100,000 acres planted to cotton in Korea during the past season. Fairly promising results are reported from experiments in cotton growing in Egyptian Sudan, Transvaal, and Algeria, but in Cape Province and Mozambique the conditions for commercial production of cotton are said to be very unfavorable. Experiments have been made with Egyptian cotton in Palestine and Thessaly, and 80 acres near Jaffa yielded cotton lint and seed that was sold

for \$5647. The quality was said to equal the best Egyptian. In Thessaly 750 acres were planted to Egyptian cotton in 1910.

**EXPORTS AND IMPORTS.** The exports of cotton from the United States for the year ending June 30, 1910, were 6,253,293 bales, valued at \$450,447,802. At the same time cotton valued at \$15,816,138 was imported, and it is reported that short staple cotton was imported from India for consumption in mills in the Southern States. Of the imports, Egypt supplied \$11,483,555, Peru \$1,098,428, and Asiatic countries \$1,108,119 worth of cotton.

**COTTON BY-PRODUCTS.** The so-called by-products of the cotton crop for 1909 were valued at \$105,702,000, which were distributed as follows: Oil \$55,230,000, cotton-seed meal and cake \$35,910,000, hulls \$9,810,000, and linters \$4,770,000. Each ton of cotton seed yields on an average 45 pounds of linters, 40.1 gallons of oil, 811 pounds of meal, and 728 pounds of hulls. The average mill value of cotton seed in 1909 was \$27.70 per ton. The total production of seed was 4,462,000 tons, of which 3,269,000 were manufactured.

**WORK OF THE UNITED STATES DEPARTMENT OF AGRICULTURE.** Considerable work has been done by the Department in the preparation of the types of official grades of white American cotton; 175 sets of nine grades have been prepared, of which 150 will be sold or deposited and the remaining 25 kept in vacuum storage for purposes of comparison. These official standards have been adopted by the New Orleans Cotton Exchange, and there is reason to believe others will soon adopt them. Investigations are in progress on the acclimatization of types of cotton with a view to their boll weevil resistance, the breeding of new varieties, methods of culture, etc. The work begun in California and Arizona with Egyptian and other cottons has progressed so favorably that the commercial growing of cotton has begun in southern California, and the crop estimated at 12,000 bales was produced in 1910. In Arizona 2200 pounds of Egyptian seed cotton per acre were grown on well irrigated land. Methods have been discovered for the elimination of the wide variation in the Egyptian cotton when grown in the Southwest. The dissemination of wilt-resistant upland cottons is being continued and investigations are in progress in which wilt resistance is being adapted to boll weevil conditions. The boll weevil investigations are being continued, and in 1909 the line of advance of this pest was about 10 miles in Oklahoma and nearly 120 miles in southern Mississippi. In 1910 it had crossed the State of Mississippi and entered southwestern Alabama and advanced north to the lower border of Coahoma County, Miss. The advance has been at the average rate of 27,000 square miles per annum since 1904. Practically all Louisiana is now infested, and the crop in that State has fallen off nearly 50 per cent. since 1908. The value of cultural methods in combating the boll weevil has been fully demonstrated, and the chain drag by which the fallen bolls are drawn to the centre between the rows and there exposed to light and heat seems to be very efficient. The dusting of the plants with arsenate of lead has also proved economically practicable as a means for lessening the loss due to the weevil. The damage done by the boll weevil to the crop of 1909 has been estimated at 1,267,000 bales.

Among the happenings during the year that are of general interest was the successful test of a mechanical cotton picker. The machine is operated by a gasoline motor and is said to have thoroughly done its work at a cost far below that of hand picking, without injury to the plant or to the unopened bolls. At the International Conference on Tropical Agriculture, held in Brussels in 1910, the principal topic discussed was cotton, practically every country in which cotton is produced sending reports.

**CRETE.** A Mediterranean island south of Greece; an autonomous state subject to the suzerainty of Turkey. Area (estimate), 3327 square miles. Population (1900), 310,185 (Christians, 269,848; Mussulmans, 33,496; Jews, 728). Canea, the capital, had (1900) 24,537 inhabitants; Candia, 22,774; Rethymo, 9311. Primary education (nominally compulsory) is supplied in 621 Christian (30,149 pupils) and 19 Mohammedan schools (1957 pupils). Secondary schools (Christian), 29 (4174 pupils). Greek is the language and the Greek Orthodox the religion of the majority of the population. Agriculture is the principal occupation of the people, and olive oil (used in the manufacture of soap) the chief product; average annual yield, 33,000 tons. Soap factories, 18; annual output, 3,155,800 kilograms, valued at about 17,600,000 drachmas. Other products are Carob-beans (1,560,000 drachmas), valonia, fruits, wine (1,110,000 dr.), hides, leather, cheese and silk. Livestock: Sheep, 400,000; goats, 120,000; horses, 10,000; asses, 40,000; oxen, 70,000; swine, 20,000. The commerce is seen below in thousands of drachmas (1 drachma = 19.3 cents):

	1905	1906	1907	1908
Imports	15,185	19,270	18,752	21,071
Exports	11,224	17,391	11,967	18,372

The trade is largely with Greece. Vessels entered and cleared (1907), 2679, of 1,247,223 tons. Telegraph lines, 228 miles; post-offices (Cretan), 26. (Crete belongs to the Postal Union.)

The financial condition of the country is seen below (thousands of drachmas):

	1904-5	1905-6	1906-7	1907-8
Revenue	4,792	5,628	5,026	5,930
Expenditure	4,072	4,440	4,379	5,906

Revenue and expenditure (estimate) for 1908-9, 5,930,332 and 5,905,980 drachmas respectively. Public debt (1907), 5,317,226 drachmas. The Bank of Crete (the exclusive bank of issue) is capitalized at 5,000,000 (gold) drachmas. Crete is administered by a High Commissioner of the Powers (Great Britain, Russia, France, Italy) proposed by the King of the Hellenes, and is subject to the Porte, though paying no tribute. Greek officers have the direction of the gendarmerie and militia.

**HISTORY.** The movement in Crete for union with Greece continued to add to the perplexities of the Eastern question in 1910. It will be remembered that Crete declared herself a dependency of Greece on the same day that Austria-Hungary announced the annexation of Bosnia and Herzegovina, but was checked by the action of the four protecting Powers, who declared that no negotiations would be undertaken with Turkey on that subject unless order was maintained in the island. In 1909 the Powers withdrew their warships from Cretan waters. This tended to give free rein to the agitation for Cretan autonomy under Greek rule.

The closing session of the Cretan Chamber on December 31, 1909, authorized the new executive government to apply in Crete such laws of Greece as seemed advisable. The movement for annexation to Greece continued and caused much ill feeling in Turkey and anxiety to the protecting Powers. The decision of the Greek government to convoke a National Assembly stimulated the annexation agitation in Crete. (See GREECE.) On January 6 the Ottoman government sent an identical note to the Powers protesting against the alleged decision of the Cretan government requiring officials to take the oath of allegiance to King George of Greece and the courts to apply the Greek code. Great Britain and Russia in reply expressed regret at the folly of the Cretans and said that measures had been taken to prevent further acts of the kind, and especially the sending of Cretan delegates to Athens. Turkey gave warning to the Powers that if the Cretans chose deputies at the next Greek elections, Turkey would defend her sovereign rights. On February 12 the four protecting Powers notified the Cretan Executive Committee that they would not permit Cretan participation in the Greek elections. Nevertheless the majority of the Cretan Assembly decided in May to exclude Moslem deputies who had refused to take the oath of allegiance to King George. Turkey at once protested to the Powers. The Consuls-General of the four protecting Powers warned the Cretan authorities that such exclusion would have serious consequences. In Turkey popular sentiment was greatly aroused against Great Britain and Greece, and to a lesser extent, Russia, for their alleged attitude toward the Cretan question, and members of the Ulama were threatening a holy war unless the situation altered. A boycott of Greek goods was started at Constantinople and spread rapidly. Many public meetings were held in which the conduct of the Greeks was violently denounced.

Early in June notes of warning were ad-

dressed by the Powers to the Cretan Executive Committee, saying that the Powers would not permit Cretan Moslem functionaries to be debarred from the exercise of their office or to be deprived of their salaries, and another note followed declaring that if the Assembly should not receive at its next meeting the Mussulman deputies without demanding that they take an oath contrary to their sentiments the Powers would take the necessary steps to regulate the situation in Crete. On June 14, Sir Edward Grey declared that it would be necessary to prevent the Cretans from making any changes that might lead to a breach of the peace in the Near East.

The British government finally suggested that each of the four Powers should send an additional warship to Cretan waters. On June 17 the Russian Foreign Minister dispatched a note to the three other Powers accepting the British proposal and further suggesting that Crete should be reoccupied. The Powers in reply accepted in principle the proposal to reoccupy Crete if there should be further delay in carrying out their demands. It was reported later, however, that the Cretans would obey the command of the Powers and admit Moslem deputies to their Assembly without requiring the oath of allegiance to the King of Greece.

Early in July four cruisers, one from each of the Powers, arrived at Canea. The situation was critical, as the Opposition continued to refuse admission to Mussulman deputies unless they took the oath of allegiance to the King of Greece. Early in July the Porte, in an official note to the Powers, asked when they considered it the proper time to solve definitely the Cretan question.

The four protecting Powers delivered to the Cretan government an ultimatum through their consuls on July 8, declaring that they would land troops and seize the customs if the Moslem deputies were required to take the oath of allegiance to King George, or if the present Moslem officials were deprived of their salaries for refusal to take the oath. On the following day the admission of the Moslem deputies was passed by the Assembly, and the Powers at once withdrew their warships. Fresh trouble arose toward the end of August when M. Venezelos, the Cretan politician who had visited Athens and played a leading part in the movement for a Greek National Assembly, was returned as a member, along with three other Cretan delegates, in the elections for that body. The Ottoman government protested against their admission.

The Greek government being asked by the representatives of Russia and Great Britain to use its authority to cause the withdrawal of the Cretan delegates to the New National Assembly, replied that it would endeavor to do so.

At the end of November the Porte called the attention of the four protecting Powers to fresh encroachments on Turkish sovereign rights on the part of the Cretans in opening the Cretan National Assembly in the name of the King of Greece and in affirming the convention of Crete with Greece.

**CRETE, EXCAVATIONS IN.** See **ARCHÆOLOGY.**

**CRICKET.** The Staten Island Cricket Club won the championship of the New York and New Jersey Cricket Association without being defeated in a single match. This club also was easily victorious over the Belmont Cricket Club

of Philadelphia and drew with the Ottawa Cricket Club. The Metropolitan District Cricket League series both in Class A and Class B was won by the Brooklyn Cricket Club. In the county championships in England for the second year in succession the Kent men were the victors, winning 19 matches, losing 3 and drawing 3.

**CROPS.** See **AGRICULTURE** and separate articles on crops.

**CROSS COUNTRY RUNNING AND MARATHONS.** Long distance running in 1910 again proved a popular sport for hundreds of athletic clubs, colleges, and schools throughout the United States. In Canada and England, too, the interest shown in distance events both by athletes and the public was very great. The Senior Metropolitan cross country championship run, which annually attracts a large number of entrants from clubs in the vicinity of New York City, was held in Paterson, N. J., in May. W. J. Kramer of the Acorn A. A. who carried off the junior championship in 1909 was the individual winner, his time for the six miles (about) being 39 minutes 34 seconds. Harry McGinn of the New York A. C. finished second, T. Dwyer of the Mohawk A. C. third and W. Bailey of the New York A. C. fourth. The team scores were: Mohawk A. C., 32; New York A. C., 43; Acorn A. A., 67; and Mott Haven A. C., 77. The junior championships were held at New York, the individual winner being Joseph Gilbert of the Mohawk A. C., who ran the 5¼ miles in 26 minutes 51 seconds. Harry McGinn of the New York A. C., who finished second in the senior race, won the same place in the junior.

The intercollegiate cross country championships held at Princeton on November 12 for the third successive year were won by Cornell, five of the Ithaca team finishing before the first of the Dartmouth, Princeton, or Columbia runners crossed the line. Cornell's team score was 37 as against 70 for Harvard which captured second place. The score and order at the finish of the other colleges entered were: Yale, 73; Michigan, 86; Massachusetts Institute of Technology, 120; Princeton, 171; Pennsylvania, 193; Dartmouth, 211; Columbia, 230; and College of the City of New York, 308. J. P. Jones of Cornell was the individual champion, his closest rival being T. S. Berna, one of his team-mates, who won the race in 1909 and who holds the 2-mile intercollegiate record. Among the amateur Marathon runs in 1910, the most important were those at St. Louis, under the auspices of the Missouri A. C., which was won by J. J. Sullivan of Chicago; at Hamilton, Ontario, where the winner was M. J. Ryan of the Irish American A. C. of New York, and the Vendome Club's Marathon at Newark in which E. H. White of Staten Island was the victor.

Many professional Marathons took place in the larger cities of the United States, but they

failed to arouse the enthusiasm on the part of the public that they did in the preceding year. Several of these events, because of this fact, brought financial losses to the promoters. The racing itself was in most instances high class. Both the indoor and outdoor records for the event were broken in the United States, and in England too the indoor record fell. Three international Marathons were run during the year, two in New York and one in London, England. The first took place in the 69th regiment armory in New York on March 1 and was won by T. Johansen of Sweden, whose time, 2 hours 36 minutes 55 1-5 seconds, established a new indoor record for the United States. J. Crowley of New York finished second. On April 2 an outdoor Marathon race was held at the Polo grounds and again a Swedish runner carried off the laurels. The winner was G. Ljungstrom, who broke all records by completing the course in 2 hours 34 minutes 8 2-5 seconds. J. Svanberg, another Swede, it is said, ran the distance at Canobie Park Lake, N. H., in 2 hours 29 minutes 40 seconds, but the accuracy of the time was questioned. The international Marathon held in London was won by L. Bouchard of France in the record time of 2 hours 36 minutes 18 seconds.

**CRUELTY TO ANIMALS, AMERICAN SOCIETY FOR THE PREVENTION OF.** An institution whose object is sufficiently indicated by its title, founded in 1886. In 1910 there were received by the society 10,157 complaints of alleged cruelty, resulting in 2091 arrests and prosecutions; 6393 animals were suspended from labor, 2481 horses, mules, and other large animals were humanely destroyed; 318,615 small animals, homeless or disabled past recovery, were also destroyed and 1168 disabled horses and other large animals were removed in ambulances. The excess of expenditures over incomes was \$22,656. The society received in bequests and from members' dues, donations, and other sources \$117,110. The president is Alfred Wagstaff and the secretary, Richard Welling.

**CRUELTY TO CHILDREN, NEW YORK SOCIETY FOR THE PREVENTION OF.** A society founded in New York City in 1874 for the purpose indicated by its name. Its authority is given under the laws of New York State. During 1910 it received 18,541 complaints, and prosecuted 7947 offenders, of whom 6533 were convicted. There were rescued from destitute and vicious surroundings 7817 children, and 7899 children received care, food and clothing at the building of the society. The society investigates all complaints of neglect of children and brings action against the offenders. A school of instruction for prospective workers is conducted in the building of the society at 284 Fourth Avenue, New York City. The president in 1910 was John D. Lindsay, and the secretary and superintendent was Thomas D. Walsh.

**CRUZ, ANIBAL.** A Chilean diplomat, Minister to the United States, died December 18, 1910. He was born in 1865 and was regarded as one of the foremost men in public affairs in Chile. He had been a member of the Chilean Congress and Minister of War of that country. He was appointed Minister to the United States in 1907. In April, 1910, he acted as chairman of the

Chilean delegation at the Pan-American Conference at Buenos Ayres.

**CUBA.** An island republic of the West Indies. The capital is Havana.

**AREA, POPULATION, ETC.** The area of the six provinces constituting the republic is 44,164 square miles, including the Isle of Pines and small islands and keys with an approximate area of 1350 square miles. The population in 1887 was 1,631,687; in 1899, 1,572,797; in 1907 (according to the census of Sept. 30), 2,048,980. The death-rate per 1000 decreased from 17.35 in 1900 to 12.69 in 1909. Immigration in 1909, 31,286 (24,662 Spanish). The principal cities, with populations according to the 1907 census and estimates published in 1910, are: Havana, 297,159 and 302,526; Santiago, 45,470 and 53,614; Matanzas, 36,009 and 64,385; Cienfuegos, 30,100 and 70,416; Camagüey, 29,616 and 66,460; Cardenas, 24,280 and 28,576; Sancti Spiritus, 17,440 and 36,572; Santa Clara, 16,702 and 46,620. The above mentioned estimates give for Manzanillo, 54,900; Colon, 52,006; Holguin, 50,224; Pinar del Rio, 50,071; Guantnamo, 43,300; Guines, 32,216.

The primary and secondary school systems were reorganized under American rule. Primary instruction is nominally compulsory. The reported number of primary schools at the end of 1909 was 2171, with 3613 teachers, an enrollment of 132,740 pupils, and an average attendance of 98,489. There are various schools for secondary instruction, and higher and professional education is provided by the University of Havana, which has about 600 students.

**INDUSTRIES.** The staple agricultural products are sugar and tobacco. Other crops are cacao, potatoes and other vegetables, cereals, and fruits, especially pineapples. The production of raw sugar has been as follows: 1889-90, 632,268 tons; 1894-5, 1,004,264 tons; 1896-7, 212,051 tons; 1899-1900, 283,051 tons; 1904-5, 1,183,347 tons; 1906-7, 1,441,910 tons; 1907-8, 969,175 tons; 1908-9, 1,521,818 tons; 1909-10, 1,808,221 tons, the largest crop on record. The last two crops were valued at \$85,808,800 and \$112,552,700 respectively. About one-third of the entire yield is in the province of Santa Clara. From sugar cane are also produced large quantities of molasses, aguardiente, and alcohol. The tobacco yield in 1907 amounted to 440,745 bales (of about 120 pounds each); in 1908, 563,059; in 1909, 494,358. Livestock, June 30, 1910; 3,098,179 cattle, 572,901 horses, 59,994 mules, 2414 asses. The mineral wealth of the country is considerable, especially in Oriente, including iron, copper, manganese, lead, zinc, gold, asphalt and salt. The manufacture of cigars is a very important industry.

**COMMERCE.** Imports and exports for fiscal years ended June 30 have been valued as follows:

Imports				
	1908	1909	1910	
Mdse. ....	\$ 86,368,767	\$ 83,856,835	\$ 98,239,539	
Specie .....	1,150,376	2,934,536	5,216,588	
Total .....	87,519,143	86,791,371	103,456,127	
Exports				
Mdse. ....	98,849,091	115,637,321	144,036,697	
Specie .....	4,245,769	1,926,546	2,786	
Total .....	103,094,860	117,563,867	144,039,483	

Leading imports in the fiscal year 1909: Cereals, \$11,640,991; meats, \$9,627,128; cotton and its manufactures, \$8,023,562; iron and steel, \$4,523,952; machinery, \$4,108,560; manufactures, \$3,724,147; food substances (not otherwise classified), \$3,660,606; vegetables, \$3,568,974; vegetable fibres, \$2,837,486; wood and its manufactures, \$2,042,161. Leading exports, fiscal year 1909: Sugar (crude and refined), \$70,996,726; tobacco (unmanufactured), \$20,072,681; tobacco (manufactured), \$12,938,624; copper and manganese, \$2,543,068; fruits, \$2,326,854; woods, \$1,436,045; sirups, \$1,196,899; skins and hides, \$1,030,811.

Trade by countries in fiscal year 1909: United States, imports from and exports to, \$42,612,242 and \$101,457,343 respectively; Great Britain, \$10,639,462 and \$4,959,040; France, \$7,576,617 and \$1,296,447; Spain, \$7,390,782 and \$1,460,445; Germany, \$6,350,534 and \$4,484,290; other American countries, \$7,325,229 and \$2,430,469; other European countries, \$3,336,100 and \$1,003,857; all other countries, \$1,560,405 and \$471,976; total imports, \$86,791,371, and total exports, \$117,563,867.

The great bulk of all articles exported, as classified above, went to the United States, with the exception of manufactured tobacco; of this, Great Britain received a value of \$4,166,211, the United States \$3,767,037, Germany \$1,507,392. The number of cigars exported was 181,294,502, as against 118,846,784 in 1908. The sugar export was 1,431,538 tons, all of which except about 10,000 tons went to the United States. Pineapple export (mostly to the United States), 1,263,466 crates of 80 pounds each.

**COMMUNICATIONS.** At the beginning of 1910, length of railways, 2329.8 miles; telegraph lines, 5065 miles; telegraph offices, 171; post-offices, 472. On Oct. 4, 1910, a railway was opened between Santiago and Bayamo. Several new railways and extensions are projected.

**FINANCE.** When the American provisional government ceased, Jan. 28, 1909, there was in the treasury \$2,658,829. Obligations relating to the month of January reduced this amount by \$2,023,775, leaving a balance of \$661,453. There were, however, various other obligations, so that, according to the message of President Gomez (April 4, 1910) there was an actual deficit of \$11,259,371 on Jan. 28, 1909. Up to Mar. 31, 1910, this deficit had been reduced by \$3,373,029, and there was \$1,457,515 in the treasury. Estimated revenue and expenditure for the year 1909-10, \$33,825,499 and \$31,070,412 respectively; for 1910-11, \$34,779,680 and \$30,996,600. The estimated revenue from customs in 1910-11 is \$24,731,580, and from the national lottery, \$3,000,000. Funded debt (1909), \$48,296,585.

**ARMY.** The Cuban Permanent army which had been organized and trained by officers detailed from the United States Army was organized as a brigade of two regiments of infantry. Each of these battalions, and an artillery division consisting of two field batteries, four mountain batteries, a modern gun corps of four companies, and a corps of coast artillery. There was also a general staff and the strength of the entire organization was estimated at about 5000.

**NAVY.** By an act of the Cuban Congress of July 3, 1910, the revenue-cutter service became the navy. Towards the end of 1910, it was announced that contracts had been awarded for

REVISED, 1910

११०६

the construction of two cruisers in the United States and two small cruisers in England.

**GOVERNMENT.** The executive authority is vested in a president, who is elected for four years and is assisted by a cabinet appointed by himself and responsible to Congress. The legislative power devolves upon a Congress of two houses, the Senate (24 members) and the House of Representatives (64). The President in 1910 was Gen. José Miguel Gomez, who was inaugurated Jan. 28, 1909; Vice-President, Alfredo Zayas. Each of the six provinces is administered by an elective governor.

**HISTORY.** On Feb. 3, two editors were sentenced to imprisonment for libeling President Gomez. Señor Morna, the first negro to hold a Cabinet office, was installed on April 16. An uprising occurred near El Caney in July, but was of slight importance and soon put down by the Rural Guards, who captured the leader and two companions. At a convention of the Liberal party on August 1, the Secretary of the Treasury, Villegas, became involved in a quarrel and the President subsequently ruling that no Cabinet Minister should henceforth attend political meetings, he resigned. Congress adjourned in July. The President in his message urged a campaign against tuberculosis. As to the government profits from the lottery, he recommended that \$1,346,000 be applied to the building of new revenue cutters and a Presidential palace. A bill for exchanging the government's arsenal property on the river front for a railway terminal in the heart of the city passed both Houses in spite of the sharp criticism of the Havana press and the disapproval of it by the United States government. Charges of bribery were made in connection with it. A project for a gambling resort on the plan of Monte Carlo was passed by the House, in spite of much adverse comment in the press, but was deferred in the Senate until the next meeting of Congress. The first congressional elections under the new régime were held in November, the terms of half the members, both in the Senate and in the House, having expired. The Liberal party was divided in its counsels. The ultra-radical or Young Cuba faction, demanded the prohibition of religious orders, suppression of trusts, and the prevention of foreign corporations from holding real estate in Cuba, while the other group had as the chief plank in its platform the abolition of the Platt amendment to the Constitution. The negroes also showed themselves discontented and endeavored to found a party of their own but did not succeed in effecting an organization. The elections were conducted without disorder. The Liberals were generally victorious although the strength of the Conservative party increased. On the opening of Congress the President urged tariff revision in the interest of certain Cuban articles of manufacture, which needed better protection and asked that a new Palace of Justice be built and public libraries established in the chief cities. The Senate rejected the bill for a gambling resort. An attempt had been made to assassinate General Guerra, Commander of the Cuban army. He attributed the crime to a police lieutenant, who could not be found. At the same time charges were brought by Vice-President Zayas and Mr. Steinhardt, formerly United States Consul, that a plot had been made to assassinate them, but the Supreme Court before

which they had been laid, refused to consider them. The subject was much discussed in the press. There was an attempt made to associate the assassination with a bill before Congress providing that the head of the army should not be removed except for cause, and it was declared that the bill was not approved by the Commander of the Rural Guard, General Montecagudo.

**CUCKOO.** See ORNITHOLOGY.

**CUDAHY, MICHAEL.** An American merchant, died Nov. 27, 1910. He was born in Callan, County Kilkenny, Ireland, in 1841. In 1849 he came with his parents to the United States, settling in Milwaukee. He became an employe in a packing house and gradually rose to be manager, and partner in Armour & Company from 1873 to 1890. Engaging in business independently, he became president of the Cudahy Packing Company of Omaha, Sioux City and Los Angeles. He was president of the American Transportation and Trading Company and was connected with other financial enterprises.

**CUMBERLAND PRESBYTERIAN CHURCH.** A religious denomination organized in 1810 as the result of a revival in "the Cumberland country" in Kentucky and Tennessee, conducted by Rev. James McCreedy. The denomination was founded as the result of objections on the part of the regular Presbyterian church in Kentucky to the admission to the ministry of men who were not up to the usual literary and theological standard, and to certain reservations in the acceptance of the Westminster Confession, dealing with the doctrine of predestination. Nearly all the churches of the Cumberland country adhered to the new presbytery, which was constituted February 4, 1810. The denomination became in the following years of considerable strength in the South. Proposals were made at various times for union with other churches, and in 1903 the union with the Presbyterian Church in the United States of America was proposed. The general assemblies of both churches appointed committees on fraternity and union. These held a joint meeting and formulated a basis of union, which was approved by the general assemblies in 1904 and was ratified by the presbyteries of each body in the following year, when the general assemblies took action for the organic union of the two churches. Meanwhile considerable opposition had arisen in the Cumberland Church and a protest had been filed against the constitutionality of the assembly's action. The civil court, to which the matter was referred, held the action to be legal, and when it became evident that it was to be carried through, another movement was started in the Cumberland Church to "enjoin the general assembly from taking the final steps to merge, unite or consolidate the Cumberland Presbyterian Church with the Presbyterian Church of the United States of America." The court refused the injunction and the general assembly by a vote of 165 to 91, approved the report and "adjourned sine die as a separate assembly, to meet in and as a part of the One Hundred and Nineteenth General Assembly of the Presbyterian Church of the United States of America." The opposition then filed a protest and determined to "continue and perpetuate the General Assembly of the Cumberland Presbyterian Church as same was constituted and

organized on May 17, 1906" and declared itself "to be the Cumberland Presbyterian Church, the repository of its established faith, the owners of its property and the protectors of its trusts." It held that all offices had been vacated, appointed men to fill the vacancies in the boards, rescinded the action and announcements of the general assembly and adjourned to meet in Dickson county, Tennessee. Suits were brought in a number of courts in regard to church property during the years following with varying results. The courts up to November 1, 1910, had made decisions as follows: The Supreme courts of Georgia, Kentucky, Texas, Arkansas, Illinois, Indiana and California favored the union in their decisions. The Appellate court of Texas and Indiana and the Supreme courts of Tennessee and Missouri in their decisions were unfavorable to the union. Most of the courts upholding the union have done so on the ground that a civil court cannot review the decisions of an ecclesiastical court. On the other hand, the two appellate courts and the two supreme courts unfavorable to the union declared it null and void, and that a union was impossible on account of doctrinal differences and on account of a want of constitutional authority. The most important result of these suits, from the standpoint of the Cumberland Presbyterian Church, was the possession gained of the Cumberland Presbyterian Publishing House at Nashville, Tennessee, valued at \$200,000, which was surrendered to the Cumberland Board of Publication in February, 1910. The last General Assembly of the Cumberland Presbyterian Church convened at Dickson, Tenn. May 19th to 24th, 1910. According to the United States census of 1906, published in 1910, the total number of communicants in March, 1906, was 195,770, with 2474 churches and 1514 ministers. The present membership

made up of the islands of Curaçao (210 square miles; 30,883 inhabitants), Bonaire or Buen Ayre (95; 6233), Aruba (69; 8555), St. Martin (17; 3185), St. Eustache (7; 1283), and Saba (5; 1949). The population is that given Dec. 31, 1907. Of St. Martin, only the southern part belongs to the Dutch colony, the northern to France. Capital, Willemstad (about 14,000 inhabitants). Corn, beans, pulse, cattle, salt, and phosphate of lime are the main products. Imports and exports (1907), 3,750,863 and 1,306,509 guilders respectively (1 guilder=40.2 cents). Vessels entered, 3338, of 634,722 tons. Revenue and expenditure (estimate 1910), 656,205 and 966,995 guilders respectively, the difference being made up by the home government. The colony is administered by a governor (1910, Dr. Th. I. A. Nuyens).

**CURRENCY.** The total stock of money in the United States, June 30, 1910, was \$3,419,500,000. Of this 927 per cent. was held in the Treasury as assets; 41.37 per cent. was in banks; and 49.36 per cent. in circulation among the people. Excluding the \$317,200,000 in the Treasury the aggregate circulation was \$34.33 per capita. This compared with \$34.93 in 1909; \$31.08 in 1905; and \$26.94 in 1900. The total stock of money in banks was \$1,423,808,000, of which sixty per cent. was held by national banks. The following table shows the total stock of money, the amount held in the Treasury as assets, and the amount in circulation, November 1, 1910. The gold coin and bullion in the Treasury includes the reserve held to redeem greenbacks, the amount represented by the gold certificates, both within and without the Treasury, and the gold available for general government purposes. The silver certificates are set over against the silver dollars.

	General Stock of money.	Amount held in Treasury as Government Assets.	Amount in Circulation.
Gold coin (including bullion in Treasury).....	\$1,692,759,176	\$197,964,562	\$594,934,945
Gold Certificates .....		63,059,500	836,800,169
Standard Silver Dollars .....	564,059,508	633,229	76,058,279
Silver Certificates .....		5,691,589	483,376,411
Subsidiary Silver .....	156,146,796	16,995,517	139,151,279
Treasury Notes of 1890 .....	3,518,000	7,442	8,510,568
United States Notes.....	246,681,016	5,496,564	341,184,452
National Bank Notes.....	724,874,308	18,805,902	706,068,406
<b>Total.....</b>	<b>\$3,488,738,804</b>	<b>\$308,654,805</b>	<b>\$3,180,084,499</b>

of the denomination is uncertain. It is claimed that there are 100,000 communicants and 600 pastors, who remained in adherence to the Cumberland Presbyterian Church.

**CUMMINGS, URIAH.** An American engineer, died November 11, 1910. He was born at Akron, N. Y., in 1833. For many years he had charge of the investigations conducted by the United States on cement and concrete and was considered an authority on these subjects. He was also the inventor of over thirty successful mechanical devices and was often a contributor of articles on scientific subjects to magazines. Aside from his technical works, he wrote tales, both historical and fanciful, dealing chiefly with the Indians of western New York. He was an honorary member of the tribe of Tonawanda Indians who live upon the government reservation near Akron, N. Y.

**CUMMINS, SENATOR.** See **UNITED STATES, section Congress.**

**CURAÇAO.** A Dutch West Indian colony

The total amount of money in 23,095 banks June 30, 1910, was \$1,423,808,000, of which slightly more than 60 per cent. was held by the 7,145 national banks. All banks held \$690,683,000 in gold and gold certificates, of which amount 60 per cent. was in national banks. These latter held three-fourths of the \$236,080,000 legal tender notes (greenbacks) and 70 per cent. of the \$178,002,000 silver certificates held by all banks but only two-fifths of the \$108,652,000 national bank notes so held.

Under the provisions of the Aldrich-Vreeland Emergency Currency Act of 1907 the only currency association formed previous to 1910 was that for the District of Columbia. The reasons given for this were a feeling of dissatisfaction with the law and the absence of need for such associations. But early in the summer the Secretary of the Treasury took active steps to bring more associations into existence. Though there was nothing in the existing financial conditions to require this step, it was deemed ad-

**MME. CURIE**  
**(MARIE SKŁODOWSKA)**

111

visable as a measure of safety. Associations were formed for New York City and Philadelphia in July; for the State of Louisiana, the State of Georgia, and Boston in August; for St. Louis and Detroit in September; and for Chicago and the Twin Cities in October. These associations are expected to continue until the Act expires in 1914. On September 16, Secretary MacVeagh promulgated certain rulings regarding the withdrawal of a bank from an association and the redemption fund and the security for additional circulation.

For discussion of currency reform see CENTRAL BANK. See also articles on the various kinds of banks, and MONETARY COMMISSION, NATIONAL.

**CURRENCY ASSOCIATION.** See CURRENCY.

**CURTIS, NEWTON MARTIN.** An American soldier, died January 8, 1910. He was born in De Peyster, New York, in 1835, and attended Gouverneur Wesleyan Seminary in 1854-55. From 1857 to 1861 he held office as postmaster in his native town. He became a captain of the 16th New York infantry in the latter year and rose through successive ranks to brevet brigadier-general in 1864. This distinction he received for distinguished service near New Market. He was made major-general of volunteers in 1865 for gallant and meritorious service at the capture of Ft. Fisher. He received a medal of honor in 1891 for gallantry in this action. He was honorably mustered out of service in 1866. After serving as United States Collector of Customs and special agent of United States Treasury from 1867 to 1880 he was elected a member of the New York Legislature, serving from 1884 to 1890; he was member of Congress in 1891-93 and 1893-97, and was president of the Society of the Army of the Potomac in 1907-8. He wrote *From Bull Run to Chancellorsville* (1909) and lectured on subjects dealing with the civil war.

**CUTTER, BENJAMIN.** An American musical educator and author, died May 10, 1910. He was born in Woburn, Mass., in 1857, studied the violin under various masters in Boston and Stuttgart, and in 1882 he began teaching violin harmony and harmony analysis at the New England Conservatory of Music. He was a member of the Boston Symphony Orchestra under Henschel and Gericke. Among his published compositions are *Mass in D*, chamber music and religious choral music. He was the author of *Exercises in Harmony, Harmonic Analysis and How to Study Kreutzer*.

**CYANAMIDE.** See FERTILIZERS.

**CYCLING.** The professional sprint championship in 1910 again went to F. L. Kramer, who scored a total of 52 points. J. A. Folger ranked second, with 30 points, and P. O. Sullivan Hehir third, with 18 points. E. L. Collins won the professional paced championship, scoring 156 points, as against 105 for George Wiley. J. F. Moran, who finished second the year before, had a total of 49 points. The amateur champion was Frank Blatz, who rolled up a

total of 20 points. Chester A. Smith won second place, with 12 points. The 100-kilometre world's professional paced championships held at Brussels, Belgium, was won for the second successive year by Georges Parent. His time was 1 hour 22 minutes and 33 4-5 seconds. G. Friel was the victor in the 1000-metre world's professional contest. The amateur champion in the 100-kilometre event was H. Hens, whose time was only a few seconds slower than that of Parent, the professional champion. W. J. Bailey won the 1000-metre amateur championship, his time being 1 minute 45 2-5 seconds. In an international 2-men-team race ridden at Berlin Walter Rutt of Germany and J. Clarke of Australia were the victors, covering 2332 1/4 miles. Two teams tied for second place. They were made up of R. Walthour of the United States and Johann Stohl of Holland and Berthiet and Brocco, both of France.

The annual international six-day race held at Madison Square Garden in December again attracted thousands of spectators. At the end of the grind four teams were tied for first place and the usual mile event was ridden to place the teams. This was won by less than a wheel's length by Eddie Root, who with J. F. Moran formed the New York-Chelsea team. The other teams and their order of finish follow: Rutt and Clarke, Fogler and Hill, Hehir and Goulett, Mitten and Thomas, West and Demara, and Cameron and Halstead. The distance covered by the leaders was 2545 miles 3 laps, more than 100 miles less than that covered the preceding year and nearly 200 miles behind the record made by McFarland and Moran in 1908.

Ray Duer, who in 1909 established new paced records against time for all distances between 1 and 10 miles, added the 2-3 mile record to his list in 1910. His time was 55 seconds. Hardy Downing rode a half mile under similar conditions in the record time of 38 2-5 seconds and S. H. Wilcox rode the quarter mile in 19 seconds, also a new record. Riding against time unpaced new figures were made in four events, A. J. Clarke and E. A. Pye dividing the honors. Clarke rode the 2-3 mile in 1 minute 12 seconds and the 1 mile in 1 minutes 52 seconds while Pye rode 2 miles in 4 minutes 1 3-5 seconds and 3 miles in 6 minutes 9 1-5 seconds. In professional competition new records were made by P. O'Sullivan Hehir, who rode a third of a mile in 37 3-5 seconds; by A. J. Clarke, who rode 2 miles in 3 minutes 38 1-5 seconds and 4 miles in 8 minutes 16 2-5 seconds; by Alfred Gouillet, who rode 15 miles in 33 minutes 15 seconds; by Walter Demara, who rode 20 miles in 43 minutes 39 seconds; and by F. L. Kramer, who rode 25 miles in 54 minutes 13 seconds. In amateur competition no new records were made for the regulation distances.

**CYPRUS.** A Levantine island, occupied by Great Britain but nominally a part of the Ottoman Empire. Capital, Nicosia (14,752 inhabitants; 1908 estimate 16,079). Area, 3584 square miles. Population (1901), 237,022; 1908 estimate 258,997, exclusive of the military. Mohammedans, 56,026; Christians, 199,685. Larnaca (8681) and Limasol (9044) are the chief ports. Elementary schools (1908-9), 561 (376 Christian, 185 Moslem), with 28,680 pupils. Agriculture is the chief industry. Yield (1908): wheat, 2,521,468 bushels; barley, 2,345,872; vetches, 214,456; oats, 397,519. Olives, cotton,

grapes, carob-beans, fruits, linseed, silk, cheese, wool, and hides are also produced. Livestock (1898): 62,174 horses, etc.; 47,242 cattle; and, in 1908, 277,230 sheep and 256,345 goats. Irrigated for winter crops (1906-7), 1945 acres. Sponge fishing is carried on. Asbestos and copper are mined. Gypsum, terra umbra, and marble exist in abundance. The trade for three years, exclusive of specie, and the revenue and expenditure are given below:

	1906	1907	1908
Imports* .....	£501,921	£629,054	£567,444
Exports* .....	464,392	603,530	588,902
Revenue † .....	286,873	311,810	303,447
Expenditure † .....	182,066	203,209	244,061
Gov. grant † .....	28,000	50,000	50,000

\* Calendar years. † Fiscal years 1906-7, 1907-8, 1908-9.

Tonnage entered and cleared (1908), 955,859. Public debt, 292,537 pounds; yearly tribute to the Porte, 92,800 pounds. There are 746 miles of good roads; 61 of railways; 240 of telegraph lines; a cable connects with Alexandria. The colony is administered by a British high commissioner (1910, Sir Charles Anthony King-Harman), assisted by an executive council and a legislative body of 18 members.

**CYRENE**, EXCAVATIONS IN. See **ARCHÆOLOGY**.

**DA COSTA**, JOHN CHALMERS. An American surgeon, died December, 1910. He was born in Philadelphia in 1863 and graduated from the Scientific Department of the University of Pennsylvania in 1882. He studied at the Jefferson Medical College, graduating in 1885. He was connected with various hospitals and the Jefferson Medical College in Philadelphia as resident physician, assistant surgeon, demonstrator of surgery, and professor of surgery. He was one of the most eminent surgeons of the United States. He was the author of *A Manual of Modern Surgery* (1895-1906, 5 editions). He also edited the new American edition of Gray's *Anatomy of 1905* and contributed on surgical subjects to medical periodicals.

**DAHLITE**. See **MINERALOGY**.

**DAHOMY**. A French colony in French West Africa (q. v.). Area, 107,000 square kilometres. Estimated population (1908), 820,443. Capital, Porto-Novo, with 22,507 inhabitants. There were in 1908 8 official schools, with 985 pupils; 20 private, with 2016; 105 Mussulman, with 1775. The principal products are as follows (the values given are for 1908 exports): Palm kernels, 5,557,658 francs; palm oil, 4,595,926; corn, 1,198,439; live animals, 137,611; copra, 80,633; textiles, 68,695; animal products, 19,606. Total imports and exports (1908), 10,737,378 and 12,179,530 francs respectively. Vessels entered, 439, of 25,964 tons; cleared, 439, of 55,211 tons. Total railways, 267 kilometres; telegraph lines, 2117 kilometres; number of post and telegraph offices, 25. Revenue in 1908, 3,289,507 (direct taxes, 1,104,844 francs; patents and licenses, 183,299; posts and telegraphs, 82,834; etc.); expenditure, 3,070,085. A lieutenant-governor (1910, H. Malan) administers the colony under the direction of the governor-general of French West Africa.

**DAIREN** (formerly, **DALNY**). See **KWANTUNG**.

**DAIRYING. MILK SUPPLY.** The number of milch cows in the United States in 1910 remained about the same as in 1909, but the quality of the stock has improved somewhat as the high price of beef sent many inferior cows to the shambles. The annual increase in the amount and value of milk and milk products was about normal. The conditions which govern the manufacture of butter, cheese, and condensed milk varied but little from preceding years, but the disturbing factors which affect the fresh milk supply of cities and large towns were more pronounced than usual. The amount of milk produced annually is constantly increasing and is now estimated at about 7,267,000,000 gallons, about one-third of which is consumed as such. Since milk is particularly the food of infants and invalids the agitation for a pure milk supply has become almost universal. The dairyman has been warned that he must keep only healthy stock and take more care in the handling of milk and cream. He has also been confronted with increased costs of living for himself and for his stock. But the consumer has objected to any increase in the price of milk and therefore the dairyman has been forced into an unenviable position until the public can be educated to appreciate sanitary milk at its true value. The year will be remembered as one of general unrest for those engaged in supplying cities with milk.

**PURE MILK REGULATIONS.** Nearly all of the large cities have increased the stringency of the milk regulations within a year or two. Many of them require a bacterial count in addition to a stated fat content and other requirements. Many restrictions concerning the production and sale of milk have been imposed by state as well as by municipal authorities. The city of Chicago passed through the second year of the enforcement of a drastic ordinance which requires that all milk sold in the city be pasteurized or be produced by cows which do not react to the tuberculin test. The same requirement was also announced for the city of Washington, D. C., in the latter part of the year. Boston has had a year in which no milk was lawfully sold in bulk. Among other regulations the Idaho State Board of Health announced the following: "No person, firm or corporation on and after May 15, 1910, shall give, furnish, sell or offer for sale, or deliver any milk or cream in quantities less than one gallon except in sanitary bottles, sealed with suitable cap or stopper, except where milk is sold at a milk house or dairy."

**PRICE AND COST OF PRODUCTION.** The most serious annoyance to the milk traffic was the Boston milk war between the producer and contractor. It lasted over five weeks and was the largest movement of its kind which has yet occurred. Boston consumes annually about 92,000,000 quarts of milk. Over one-half of this amount is shipped by producers from without the State. On the refusal of the city contractors to advance the price paid to the producer so that the latter would receive winter rates through the summer, many shippers ceased sending milk to Boston on May 1. The trouble was finally adjusted by a compromise. The contractors agreed to pay the winter price of 35½ cents per 8½ quart can for ten months. A joint special committee of the Massachusetts Legislature was appointed to investigate the dairy industry and after numerous hearings

recommended that the railroads provide an open car system for producers; that the railroad commissioners be given more authority over rates and service for milk transportation, and that better inspection of milk be provided. They concluded that dealers were making a fair profit and could afford to pay the producers at least 4 cents per quart. The Attorney-General of the State of New York investigated a so-called milk trust in New York City and found that a combination of dealers existed which fixed the sale price of milk to the consumer and the price paid to the producer. An important result was the reduction of the price of milk from 9 to 8 cents per quart. The Secretary of Agriculture made an inquiry concerning the price of milk in all of the large cities and discovered that the producers received less than 50 per cent. of the price which the consumer pays for the product. The railroads receive about 7 per cent. and the rest goes to the wholesaler and retailer. The average price paid in June by consumers in 78 cities was almost exactly 8 cents per quart. In the North Atlantic and North Central States the average was 7.5 cents, in the Western States 8.9 cents, in the South Central 9.1 cents, and in the South Atlantic States 9.3 cents per quart.

**STUDIES IN THE MILK PROBLEM.** At the call of the New York Milk Committee a conference on the milk problem was held in New York City in December which brought together a large number of specialists from all parts of the country who discussed the problems connected with controlling the milk supply in the interest of public health. During the year many bacteriological studies have been made of raw, pasteurized, and sterilized milk. Esten at the Connecticut Station has found that cows' mouths are the most abundant sources of at least one type of lactic acid bacteria, and that winter milk has a higher acidity than milk produced in the summer. Prescott and Breed at the Massachusetts Institute of Technology have devised a new and more accurate method of counting leucocytes in milk, a much larger number being normally present than was revealed by the methods previously used. Hewlett and his associates in England find that there is a large increase in the number of leucocytes in milk at the beginning and end of the lactation period. Hoffman at the Wisconsin Experiment Station found that in milk high in leucocytes from normal causes the leucocytes do not contain fibrin, which is an important distinction in studying pathological conditions of the udder. At the Virginia Experiment Station it was found by actual count that sprinkling the straw bedding in cow stalls so as to prevent dust and bacteria from arising reduced the percentage of bacteria 53 per cent. and that the number was still further reduced by using a closed pail and moistening the flanks of the cow before milking. Romer and Sames in Germany have tested the effect of sterilizing milk with ultraviolet rays. They do not consider it a practical method as the milk acquires an acid taste before it is completely sterilized.

Ayers and Johnson of the United States Department of Agriculture have completed the most thorough study of pasteurized milk ever made. They found that the relative proportion of the peptonizing, lactic acid, and alkali groups of bacteria is approximately the same

in pasteurized and in clean raw milk. Pasteurizing does not prevent milk from souring but merely delays the process. Peptonizing does not take place unless the milk is heated at a temperature high enough to destroy all germs in the negative stage.

**COW-TESTING.** Many new cow-testing associations have been organized during the year. The value of these associations is shown by one which has been in existence for four years. In this case the annual profit per cow has been nearly doubled and the average return for each dollar invested in feed has increased from \$1.64 to \$1.98. A Holstein cow owned by the Missouri Experiment Station has surpassed the previous world's record for milk production for six months. In that length of time she produced 17,008 lbs. of milk or an average of 93.4 lbs. per day for 182 days. At that station a careful study was made between heavy and light milkers. The real difference in the capacity of individual cows to produce milk economically was proved to be in the ability to consume a large amount of feed above maintenance requirements, rather than in the ability to make a better use of the food eaten.

**CONDENSED MILK.** The condensed milk industry has increased so that the factories in the United States require 1,500,000,000 pounds of fresh milk annually. Hunziker at the Indiana Station has made studies on factors affecting the quality of the product and has found that breed, feed, care of the cows, period of lactation, care of the milk and season of the year greatly influence the effect of concentration on the marketable properties of condensed milk, and he recommends a change in the Federal Standard. The use of dried milk is on the increase, and a method has been devised in which the action of cold is substituted for that of heat during the first stages of the process.

**BUTTER AND CHEESE.** The continued high price of butter has curtailed its use to some extent and its place has been taken by oleomargarine. The output of uncolored oleomargarine has doubled since 1908, and if this increase continues the price of butter and its consumption per capita will be reduced. A study of the keeping qualities of butter at the Michigan station show that one species of organism was active at a temperature of  $-6^{\circ}$  C. in salted butter. A series of studies for the past four years at the Illinois station shows that the pasteurization of milk does not affect the body or texture of the butter nor improve the quality of the butter made from milk of a poor quality. The method of making cheese of the Cheddar type from pasteurized milk has been improved by experiments carried out by the Wisconsin Experiment Station so that a cheese of uniform texture and quality can be made throughout the year with the use of hydrochloric acid.

#### DAIRY PRODUCTS OF FOREIGN COUNTRIES.

(1) **CANADA AND GREAT BRITAIN.** The dairy industry in Canada has made the usual growth, but as in the past three years the exports of dairy products decreased owing to a larger home consumption. The total value of dairy products exported was about \$20,000,000; the greater portion consisted of cheese, nearly all of which was sent to Great Britain. An accidental printers' error in the Aldrich-Payne tariff bill which reduced the tariff on cream entering the United States from 5 cents

per pound to 5 cents per gallon has caused heavy shipments of cream from Canada to the Northern States to be manufactured into butter.

Since 1880 there has been a remarkable change in the milk trade in the United Kingdom, so that milk is now the chief source of income to many who formerly depended upon wheat. The annual milk production is now estimated as 8,686,000 tons, valued at £57,725,000. A notable change in the industry is the formation of large coöperative milk supply depots. A movement has recently been started to send fresh milk from Ireland to the London market. Although Great Britain makes about 75,000 tons of butter per year, the imports amount to 210,000 tons, exceeding in value the imports of every other article of food except wheat and sugar. The imports of butter from foreign countries has decreased the past year, but there was a corresponding increase of colonial importations, due to the development of the dairy industry in Australia and New Zealand.

(2) **OTHER FOREIGN COUNTRIES.** Holland is sending more butter to Germany than formerly. Germany is also importing a large amount of butter from Siberia. Denmark exported about 17,000,000 lbs. of milk and 25,000,000 lbs. of cream to Germany; and 180,000,000 lbs. of butter, a large part going to Great Britain. The use of casein in the arts has increased 100 per cent. in Europe the past five years, Germany alone consuming 4000 tons annually. The principal uses of this important constituent of milk are as sizing for paper, paint, patent foods, combs, buttons, etc., and experiments are in progress for using it for many other purposes. Because of reforms in the land tenure of the peasantry, creameries are springing up in Siberia and to a less extent in European Russia in all sections where the transportation facilities are adequate for the shipment of butter. There are now 1868 butter factories in Siberia; about 30 per cent. are managed by artels (union associations). The exports of butter from Western Siberia in 1910 amounted to 130,000,600 lbs., an eight-fold increase since 1900. The total number of dairy cows in Australia is 1,900,000, with a milk production of 450,000,000 gallons. The butter and cheese factories number 560. Each year shows a gain in butter production and next to wool, wheat, and mining products butter is the greatest source of income, the exports now having reached the value of \$12,000,000 per annum. The latest available figures show a total production of 145,000,000 lbs. New Zealand has within five years doubled its output of dairy produce. The dairy industry in Argentina is making some growth, though it is of far less importance than the dressed meat trade. In 1910 there were 29 butter factories, 76 cheese factories, 85 factories for making a variety of products and 529 establishments designated as creameries. Among the important books on dairying published were Grimmer, *Chemie und Physiologie der Milch*; McCaffrey, *The First Century of Dairying in New South Wales*; Martin, Vol. II of *Geschichte der Rahmgewinnung*; Publow, *Fancy Cheese in America*; and a revised edition of *Milk and Its Relation to Public Health*, published by the United States Public Health and Marine Hospital Service.

**DALAI LAMA.** See CHINESE EMPIRE, *History*.

**DALLAS.** See MUNICIPAL GOVERNMENT.

**DALZELL, JOHN.** See PENNSYLVANIA and UNITED STATES, section *Congress*.

**DAMS.** The construction of dams is of course a natural part of the formation of great reservoirs for IRRIGATION and WATER SUPPLY projects and the reader is referred to these articles for additional information. The dams described below, built during the year, showed novel features of design or construction.

**BARREN JACK DAM.** There was in course of construction during 1910 in New South Wales a dam for the storage of water for irrigation purposes which was pronounced to be, when finished, one of the largest works of its kind in the world. The project was being carried out by the Colonial government and was for the purpose of impounding the waters of the Murrumbidgee River and two of its tributaries. The main river was to be converted into a lake for a distance of 40 miles above the dam, while the two smaller streams were to be backed up for 24 and 19 miles, respectively. The total storage capacity thus provided will be 785,000 acre feet, that is, the equivalent of a body of water one foot deep, flooding 785,000 acres. The rock in that part of the country is granite, and large quantities of boulders or "plums" were available at the site. These boulders are built into the concrete, making an unusually massive combination exactly suited to the purpose. The dam is curved against the pressure of the water, the radius of the inner face being 1200 feet. To give an idea of its size, which is in some respects greater than that of the Roosevelt dam in Arizona, it is worthy of note that the structure here described, and called locally the Barren Jack dam will be 784 feet long, 240 feet high, with a width of 18 feet at the crest, and when filled up to the spillway, the water will be 224 feet deep at the inner face. The estimated cost is \$3,680,000,—and it is hoped to finish the work in 1913.

**LA PRELE RIVER DAM.** On the La Prele, a branch of the Upper Platte River, a dam was in course of construction at a point 15 miles west of Douglas, Wyo., to impound water for an irrigation project that has about 20 miles of canals and ditches. The dam is built between the steeply inclined cliffs to a height of 130 feet. It is 330 feet long on the crest, and 110 feet long at the base, which is carried down to solid rock. It is being built of reinforced concrete, and the unusual feature of it is its form, which is that of a prism, open on one side, and strengthened by a series of slender buttresses running from base to crest, interconnected and strengthened by horizontal braces. This is known as a "hollow" dam, and offers great resistance to the pressure of the water behind it while requiring a small amount of material in its construction.

**BUTTRESSED MASONRY REINFORCED CONCRETE DAM.** In connection with the use of reinforced concrete for engineering works, there was an interesting case of its employment in the construction of a small dam on the Raritan River at High Bridge, N. J., where a masonry dam, with concrete core and up-stream face, was reinforced with steel I beams. The dam is 210 feet long and 42 feet high, 4 feet thick at the crest and 16 feet thick at base. The outside wall is built of heavy, rough rubble, with a coping of cut stone. In front, on the down stream side, it is strengthened by cut stone buttresses, 6

feet thick, and spaced 30 feet centre to centre. The core of the dam, made of concrete, is reinforced with a series of steel beams, increasing in size and weight from top to base. Thus, at the top, the beams are 12 inches in I section, weighing 40 lbs. per foot, and at the base they are 18 inch, 62 lb. beams. Under existing conditions, this was better than the usual form of steel rod reinforcement, with but little increase in expense. See also CONCRETE AND IRRIGATION.

**DANA, SYLVESTER.** An American lawyer, died January 4, 1910. He was born at Oxford, Me., in 1816, and graduated from Dartmouth College in 1839. He began the practice of law in Concord, N. H., in 1839 and resided in that city during the rest of his life. He studied in the office of General Franklin Pierce, afterwards President of the United States. After 20 years of active general practice he was appointed Judge of the Municipal Court, which he held until compelled to retire by the statutory age limitations. He was the oldest attorney in New Hampshire, and the oldest graduate of Dartmouth College.

**DANA, WILLIAM B.** An American editor and publisher died October 10, 1910. He was born in Utica, N. Y., in 1829 and graduated from Yale College in 1851. He studied law and published, died October 10, 1910. He was up the law to enter the publishing business. He purchased *Hunt's Merchant's Magazine*, a monthly, and after several years changed its name to *The Commercial and Financial Chronicle*, taking for his model the London *Economist*. He made this one of the most important financial papers in the United States.

**DANBURY HATTERS CASE.** See BORTCOTT.

**DANDLIKER, KARL.** See NECROLOGY.

**DANIEL, JOHN WARWICK.** United States Senator from Virginia, died June 29, 1910. He was born in Lynchburg, Va., in 1842. He was educated at private schools and at the Lynchburg University School, of which he was an attendant at the outbreak of the Civil War. He enlisted in the Confederate Army and was made a second-lieutenant in Stonewall Jackson's brigade. He was wounded at the first battle of Bull Run. After several engagements he was promoted to the office of major and chief of staff to General Jubal A. Early. He served until wounded at the battle of the Wilderness in 1864. After the close of the war he studied law at the University of Virginia and was admitted to the bar in 1866. He began the practice of law with his father and was elected to the Virginia House of Delegates, serving until 1872, and from 1875 until 1881 was a member of the State Senate. He was a delegate at large to the National Democratic Convention from 1880 until 1904. In 1881 he was nominated for governor but was defeated by William E. Cameron. He was elected to the House of Representatives in 1884, and to the Senate in 1887, and was re-elected for successive terms from that time including the term 1911-1917. Senator Daniel was known as one of the conservative type of Senators and had a remarkable knowledge in the science of constitutional government. He was not often heard in the Senate in the latter years of his service but when he spoke his words were received with close attention. He was often mentioned as a possible Democratic candidate for

the presidency. He had a profound knowledge of the law and was the author of *Attachments under the Code of Virginia, Negotiable Instruments*, etc.

**DANIEL'S COMET.** See ASTRONOMY.

**DANISH WEST INDIES.** A Danish colony made up of three West Indian Islands: St. Croix (area, 84 square miles; population in 1901, 18,590); St. Thomas (33; 11,012); St. John (21; 925). The inhabitants are chiefly free negroes engaged in the raising of the sugar cane. Trade with Denmark in 1908: imports £55, exports £1800; with Great Britain £202,673 and £212,147. The former considerable trade with Denmark has fallen off in late years. Governor (1910), P. C. Limpriicht.

**DARLEY, Sir FREDERICK MATTHEW.** An Australian jurist, died January 4, 1910. He was born in Ireland in 1830 and was educated in Dungannon College and Trinity College, Dublin, graduating from the latter in 1851. In 1853 he was admitted to the Irish bar, and practised for some years in Ireland. In 1861 he went to New South Wales, where he was admitted to the bar in 1862. He soon became one of the most prominent lawyers in the State. In addition, he occupied foremost positions in the Legislative Council and the Executive Council. In 1886 he was appointed Chief Justice of the State, an office which he held for over 20 years. In 1902 he was appointed a member of the Royal Commission in the South African War. He was for some years lieutenant-governor of the colony and on several occasions acted as governor.

**D'ARREST'S COMET.** See ASTRONOMY.

**DARTMOUTH COLLEGE.** A university for higher education at Hanover, N. H., founded in 1769. The number of students in the several departments of the college in 1909-10 was as follows: Academic department, 1141; medical school, 41; Thayer school of civil engineering, 43; Amos Tuck school of administration and finance, 33. The faculty numbered 120. The following were appointed new members of the faculty for the year 1910-11: Walter Van Dyke Bingham, Ph. D., assistant professor of psychology; Clifford Pease Clark, Ph. D., instructor in Greek and Latin; Harold Ripley Hastings, Ph. D., instructor in Latin; Charles Joseph Hilkey, Ph. D., instructor in political science; Raymond Watson Jones, Ph. D., instructor in German; Herbert Hunter Vaughan, Ph. D., instructor in Romance languages; Francis Asbury Waterhouse instructor in French. During the year the college received \$100,000 from the alumni for the construction of a new gymnasium, and \$10,000 on account of bequest of \$50,000 for the new administrative building. The productive funds amounted in 1909-10 to \$2,871,640 and the income to \$362,958. The library contains about 100,000 volumes. The President is Ernest Fox Nichols.

**DAVIES, G. S.** See LITERATURE, ENGLISH AND AMERICAN, *Biography*.

**DAVIS, ANDREW JACKSON.** An American lecturer and writer on spiritualism, died January 13, 1910. He was born in Orange county, N. Y., in 1826, and dictated his first book on *Principles of Nature* in 1845, after a trance of 16 hours, during which he claimed to have received his inspiration from communion with inhabitants of the spirit world. Among his other writings are *The Penetralia* (1856), *The Magic Staff*, an autobiography (1857), *Arabula or the Divine Guest* (1867), *Mental Diseases and Disorders of the Brain* (1871), and *Autobiography* (1885).

**DAVIS, REBECCA (HARDING).** An American author and miscellaneous writer, died September 29, 1910. She was born in Washington, Pa., in 1831 and began her literary career by contributing in 1861 to the *Atlantic Monthly* an article entitled "Life in the Iron Mills." In the following year the *Atlantic* published her first long novel, "Margaret Howth." In 1869 she joined the editorial staff of the New York *Tribune* and remained there for several years. She was one of the best known contributors to American magazines. In addition to her short stories she was the author of *Waiting for the Verdict*; *Dallas Galbraith*; *John Andrus*; *A Law unto Herself*; *Earthen Pitchers*, *Kent Hampden*; *Silhouettes of American Life*; *Frances Waldeau*; *Dr. Warrick's Daughters*, and *Bits of Gossip*. She married, in 1863, L. Clark Davis and was the mother of Richard Harding Davis and Charles Belmont Davis, both well-known writers.

**DAVIS, WILLIAM VAIL WILSON.** An American Congregational clergyman, killed by accident August 25, 1910. He was born in Wilson, N. Y., in 1853 and graduated from Amherst College. For a time following his graduation he was a teacher at Roberts College, Turkey, but his health failed and he returned to the United States. After his graduation from Andover he became pastor of the Congregational Church at Manchester, N. H., where he remained for six years. He then accepted a call to the Euclid Avenue Presbyterian Church in Cleveland, O. At the close of his fifth year of service he resigned. In 1888 he was called to the Union Congregational Church of Worcester, Mass. There he remained until 1893, when he became pastor of the First Congregational Church of Pittsfield, Mass. Dr. Davis was a close student of missionary work and was a corporate member of the American Board. He was for a time on the Board of Trustees of Western Reserve University. He was one of the best known clergymen in New England.

**DAWES, CHARLES D.** See CENTRAL BANK.

**DAY, CHARLES ORRIN.** An American theologian and educator, died April 5, 1910. He was born in Catskill, N. Y., in 1851, and graduated from Yale College in 1872. He studied at Andover Theological Seminary, graduating in 1877. In the same year he entered the Congregational ministry. In 1877-8 he was a city missionary in Montreal and from 1879 to 1884 was pastor in Williamsburg, Mass. After a year spent in post-graduate study at the Yale University Divinity School, he became in 1885 pastor of the Congregational Church at Brattleboro, Vt., serving in this pastorate until 1898. In 1901 he was chosen president and professor of homi-

letics and practical theology at the Andover Theological Seminary.

**DE CHARTRES, ROBERT LOUIS PHILIPPE** EUGÈNE FERDINAND D'ORLÉANS, DUC. A French nobleman, died December 5, 1910. He was born in Paris in 1840, and was the brother of the Comte de Paris and uncle of Philippe Duc d'Orléans, the French Pretender. He was the grandson of King Louis Philippe, and on the dethronement of that sovereign that he was driven with his mother, into exile. He was at this time eight years of age. After living for many years in Germany and England he graduated from the Military School at Turin in 1859, and served in the Piedmontese army during the Italo-Austrian War. On the outbreak of the Civil War in the United States, he, with his brother, the Comte de Paris, entered the Federal service, and he was made a captain in the Army of the Potomac. He served as aide to General McClellan during the Peninsular Campaign and resigned in 1863, returning to England. In 1870, on the outbreak of the Franco-Prussian War, he was living in England under the ban of exile as a Bourbon, and his request for a commission in the regular army of France was refused. After the revolution of September 4, he returned to Paris with friends of his family and offered his services to the government for the defense, but was again repulsed. He then entered the army under the name of Robert le Fort and took part in several battles. On account of his knowledge of German he was employed in the negotiations to fix the boundary line between the German and French armies during the final armistice. He was afterwards awarded the decoration of the Legion of Honor and after the abrogation of the laws of exile which had operated against the Bourbons he became chief of squadron of the 12th Chasseurs d'Afrique. He was removed from active service in 1886 under the law which prevented any member of the so-called royal family to serve in the army or navy. He married in 1863 his cousin, Françoise, Princess of Orléans. One son, Jean, Duc de Guise, and two daughters, survive him.

**DE HASS, WILLS.** An American physician and anthropologist, died January 24, 1910. He was born in Washington County, Pa., in 1817, and was educated at Western University and Washington and Jefferson College, and attended

lectures in medicine at Jefferson College. He practiced medicine in Virginia, Louisville, Ky., and Washington, D. C. At the beginning of the Civil War he recruited the 77th Ohio Regiment from the border counties of Virginia and Ohio and commanded the advance in Sherman's division at Shiloh. He was active in Virginia in support of the Union and the restoration of the State government and was among those whose efforts secured the final separation to form the new commonwealth of West Virginia. He early turned his attention to historical and scientific studies and extensively investigated American prehistoric archaeology. He was for a time United States Consul in Yucatan. He delivered many lectures before historical and scientific societies and was the author, among other works, of the *History of the Early Settlement and Indian Wars of Western Virginia*; *History of West Virginia*; *Attempts to Separate the West from the East*; *The Civil War in Virginia*; *Prehistoric America*; *The Mound Builders—Their Monumental and Art Remains*; *Antiquities of Ohio Valley Ancient Tablets*; *Reminiscences of Half a Century*, and many monographs and papers on American history and archaeology.

**DELAGRANGE, LÉON.** A French sculptor and aviator, killed as the result of an accident to his aeroplane, January 4, 1910. He was born in 1872 at Orléans and was educated at the Fine Arts School in Paris. As a sculptor he accomplished some notable work. Among the best known pieces made by him are the following: "Florentine Page"; "A Templar"; "Love and Youth"; "A Huguenot"; and "Girl Dancers." He became interested in aviation and made some of the most notable performances in his aeroplane recorded in 1908-9. His first public flight was made in March, 1907. He established a time record on September 5, 1908, in a flight of 15.2 miles in 29 minutes and 53 seconds. In May, 1909, he received the Lagatiner prize at Juvisy, making 3.6 miles in 10 minutes and 18 seconds. One of his most sensational performances was a flight made on October 16, 1909, at Doncaster, England, in a storm so severe that no other aviator would brave it. On the following day he established a world record for speed in a flight of six miles made in 7 minutes, 36 seconds, averaging about fifty miles an hour. On December 30, 1909, he established a new monoplane record. The accident which resulted in his death occurred at Pau while he was carrying on experiments at the meeting held at that place. In 1909 he was decorated with the Order of the Legion of Honor and in 1910 was presented with a medal by the Paris Academy of Sciences. In 1907 he was president of the Aero Club in France. He was the first aviator to meet death in a monoplane.

**DELAWARE.** One of the South Atlantic Division of the United States and one of the thirteen original States. It has an area of 2370 square miles, of which 1965 square miles are land and 405 are water. Its capital is Dover.

**POPULATION.** The population of the State in 1910, according to the Thirteenth Census, was 202,322, as compared with 184,735 in 1900 and 168,493 in 1890. The gain in the decade from 1900 to 1910 was 9.5 per cent. The State ranks forty-seventh among the States in point of population, whereas in 1900 it ranked forty-fifth. The population of the larger towns and

cities will be found in the tables in the article CENSUS.

**AGRICULTURE.** The acreage, production and value of the principal crops in 1909-10 are shown in the following table:

	Acreage	Prod. bu.	Value
Corn, 1910.....	202,000	6,424,000	\$3,340,000
1909.....	200,000	6,200,000	3,686,000
Winter Wheat, 1910.....	122,000	2,074,000	1,867,000
1909.....	118,000	1,652,000	1,718,000
Oats, 1910.....	4,000	135,000	68,000
1909.....	4,000	102,000	49,000
Rye, 1910.....	1,000	16,000	11,000
1909.....	1,000	14,000	10,000
Buckwheat, 1910.....	2,000	41,000	27,000
1909.....	2,000	40,000	24,000
Potatoes, 1910.....	10,000	1,030,000	618,000
1909.....	9,000	864,000	622,000
Hay, 1910.....	77,000	110,000a	1,628,000
1909.....	109,000	109,000	535,000
(a) tons.			

**FINANCE.** The report of the treasurer for the fiscal year showed a balance in the treasury at the end of the fiscal year 1909 of \$97,160. The total receipts during the year were \$743,675 and the total disbursements were \$759,911, leaving a balance at the end of the fiscal year 1910 of \$80,924. The chief sources of revenue were from railway companies and corporations. The chief expenditures were for schools, charities and executive expenses. The State debt at the end of the fiscal year amounted to \$825,785. A portion of this, however, includes debts of one fund of the State to another. The amount of State bonds outstanding was \$545,000.

#### POLITICS AND GOVERNMENT.

There was no meeting of the State legislature in 1910, as the sessions are biennial and the last was held in 1909. The next session begins on January 3, 1911.

**CONVENTIONS AND ELECTIONS.** There was no election for governor in 1910, as Governor Pennewill's term does not expire until 1913. The elections were for Representative in Congress, State Treasurer and State Auditor. The Republican Convention met on August 31 to nominate candidates for these offices. There was no trace of insurgency in the convention and this issue was not referred to in the platform. Representative William H. Heald of Wilmington was renominated without opposition. He supported Speaker Cannon in the preceding session of Congress. The Democratic State Convention met on September 13. There was a contest over the nomination for Congress and this occupied an entire day and two full secret ballots were taken. The candidates were Robert C. White of Sussex County, formerly Attorney-General of the State, and William Saulsbury. Mr. White was finally nominated. The convention also chose Millard F. Davis of Wilmington for State Treasurer, and William H. Walker of Dover for Auditor. The "wet" and "dry" issue figured largely in the convention, the deciding vote for Representative being cast by the Newcastle County delegation, the majority of whom were license men and did not wish the nomination of Saulsbury, who was an advocate of no-license. The platform adopted at the convention contained a plank favoring the revision and gradual reduction of the tariff. It also denounced any suggestion that provisions and limitations of the Federal Constitution should be disregarded, and made declaration against any encroachment upon the rights inherent in the State either by executive, legislative or judicial action. At

the November election the voters of the rural portion of Newcastle county, forming a local option district, cast their ballots for and against the sale of liquor. The vote stood 4378 for license and 3630 against license, a majority of 748 for license. The same district in 1907 gave a majority of 571 for license. Thus all of Newcastle county, in which Wilmington is situated forming its own local option district, remains "wet." Kent and Sussex counties continue "dry." After the election there were many charges made, in a general way, that the Republicans had secured the election of their State ticket by the wholesale use of money. But few specific charges were made, and several men were arrested on various charges of bribery or attempted bribery. When the year closed no convictions had been noted and no cases brought to trial. The Attorney-General of the State, however, began an investigation and questioned the various committeemen of both the Republican and Democratic parties as to the expenditure of money. No report was made up to the close of the year and the investigation was continued. The charges of bribery were made by the Democrats, and vigorous denials were filed by the Republicans, who returned with charges that the Democrats used both money and whiskey to influence voters.

**OTHER EVENTS.** In 1909 several convictions were obtained for bribery in elections in the State. On February 2, 1910, John Godwin, who had been convicted for attempt to bribe a voter, appealed to the Supreme Court of the United States. On January 19th preceding, the State Supreme Court had denied Godwin's appeal and affirmed the finding of the lower court, sentencing him to the workhouse for two years.

**DELISLE, LÉOPOLD VICTOR.** A French historian and bibliographer, died July 22, 1910. He was born at Valognes in 1826. For many years he was connected with the Bibliothèque Nationale. In 1871 he was made director of the department of manuscripts, and in 1874 general director of the great library. His published works include *Rouleaux des morts du IXème au XVème siècle* (1866); *Le cabinet des manuscrits de la Bibliothèque Nationale* (3 vols., 1868-81); *Inventaire général et méthodique des manuscrits français* (Vols. 1 and 2, 1876-78) and *Les Bibles de Gutenberg* (1894).

**DENMARK.** A constitutional monarchy of northern Europe. Capital, Copenhagen.

**AREA AND POPULATION.** Recent statistics place the area at 38,985 square kilometres (15,052 square miles). Population at end of 1897, 2,355,000; census of 1901, 2,464,770; estimated at end of 1907, 2,645,000. Marriages (1909), 19,944; births (including still-births), 78,116; deaths, 37,622; emigrants, 6782. Copenhagen had (1906), 426,540 inhabitants (suburbs inclusive, 514,134); Aarhus, 55,193; Odense, 40,547; Aalborg, 31,509.

**EDUCATION.** Primary education is free and compulsory. Public elementary schools (1908), 3408, with 358,464 pupils. The secondary schools had an attendance of 55,000. There are special and technical schools. The University of Copen-

hagen has five faculties. Complete religious toleration prevails, though the Lutheran is the established church.

**INDUSTRIES.** Agriculture is the chief occupation, and about 80 per cent. of the total area is productive. Rye is the principal bread grain, and the yield in 1910 was estimated at 18,600,000 bushels. Wheat is cultivated only on a small scale; an estimate founded on official data puts the yield at 4,100,000 bushels in 1910, against 4,000,000 bushels in 1909. Area under all cereals in 1908, 2,871,590 acres; yield, 99,000,000 bushels (of which over one-third was oats); area under permanent pasture, 3,103,519 acres. Butter and other animal products are the most important exports. Livestock (1903): 1,840,466 cattle, 486,935 horses, 876,830 sheep, 1,456,699 swine, 38,984 goats.

Fisheries products, total value in 1907, 13,587,472 kroner; in 1908, 13,180,000. There were (1908) 31 distilleries, with spirits output (reduced to 80°) of 699,275 gallons (32,893,495 potter). Beer produced (1907), 23,313,000 gallons, exciseable and 33,898,196 non-exciseable. Sugar factories (1907), 7; output, 66,300 tons of beet sugar. Margarine, etc., factories, 16; output, 29,030 tons.

**COMMERCE.** The imports and exports for four years, general and special, are given in thousands of kroner as follows:

	1906	1907	1908	1909
Imports gen.....	725,626	788,866	711,608	725,087
" spec.....	559,828	681,129	550,729	566,782
Exports gen.....	559,508	604,922	616,943	608,081
" spec.....	393,512	416,863	439,518	443,822

The principal articles of import for home consumption and exports of domestic products are given for 1908 in thousands of kroner:

Imports	1908	Exports	1908
Cereals .....	80,383	Butter .....	183,079
Oilcake .....	56,536	Meat .....	112,839

\* Cost of first installation for public enterprises.  
† Department.

Public debt, March 31, 1910: Internal, 81,886,932 kroner; foreign, 219,867,250. The accounts of the National Bank, July 31, 1908, balanced at £10,744,240. Savings banks (March 31, 1908), 518, with 1,267,362 depositors and £40,172,345 deposits.

ARMY. The army in 1910 was being reorganized according to the provisions of the National Defense Bills of 1909. It is organized on a peace basis into two corps, and while service is nominally obligatory between the ages of 22 and 39, yet the present army is actually recruited by men serving for various periods, the maximum being 1 year in the artillery and 13 months with various technical troops, and the period for the infantry 165 days. The army on a peace basis is made up of about 830 officers and 12,000 men; in 1910 there were over 11,000 troops with the colors. The formation provided for 31 line battalions of infantry and 21 battalions of the reserve, 12 squadrons of cavalry, 24 field batteries, 18 coast batteries, of which 12 are in the line and 6 in the reserve, and 12 companies of engineers. The effective war strength on mobilization of Denmark in 1910 was estimated at 83,000 men, of whom 58,500 would be infantry, 5000 cavalry, 6890 and 8600 fortress artillery. The effective was estimated at about 70,000. The reorganization was being developed in 1910 and substantial progress was made.

NAVY. The fleet, maintained for purposes of coast defense, includes 3 monitors, 3 torpedo gunboats, 14 first-class torpedo boats, one submarine, and a number of small auxiliary vessels. Two submarines are building.

GOVERNMENT. The executive authority is vested in the king and his responsible ministers; the legislative power, in the Rigsdag, composed of the Landsting and the Folkething. The present king, Frederick VIII., was born June 3, 1843; married (1869) to Princess Louisa of Sweden and Norway; succeeded to the throne

January 29, 1906. Heir-apparent, Prince Christian, born September 26, 1870. The ministry resigned *en bloc* May 27, 1910, as a result of the general elections; and was reconstituted July 5, 1910, as follows: President of the Council and Minister of War and Marine, K. Berntsen; Foreign Affairs, C. W. Count of Ahlefeldt-Laurvigen; Agriculture, A. Nielsen; Worship and Instruction, J. Appel; Public Works, T. Larsen; Interior, J. Jensen-Sinderup; Finance, N. T. Neergaard; Commerce and Navigation, O. H. V. B. Muus; Justice, F. T. von Bülow; Minister for Iceland, Bjorn Jonsson.

HISTORY. The chief question before the Folkething in 1908 and 1909 was that of national defense. On September 24, 1909, the Folkething passed a compromise defense measure providing for strong sea defenses at Copenhagen, but leaving the land defenses as they were in the 1880's, though strengthened somewhat by two new so-called sea-forts. This did not satisfy the Conservatives, who desired thorough land defenses and went too far for the Socialists, who desired disarmament. A Cabinet crisis followed in October, and for the first time a Radical Cabinet was chosen. This new Ministry under M. Zahle had only a precarious majority and did not attempt to reverse the defense policy, but announced in November that it would carry out the measures that had been adopted. Meanwhile charges had been made against the former Ministers, MM. Christensen and Berg, of neglect of duty in connection with the affair of M. Alberti, the former Minister of Justice, who had been found guilty in 1908 of embezzling a sum estimated at \$4,000,000. On December 1, 1909, a committee of the Folkething appointed to consider these charges reported in favor of arraigning M. Christensen before a judicial body of the state. In 1910 the court acquitted ex-Premier M. Christensen, but at the same time expressed strong condemnation of his conduct while in office. M. Berg was fined to the amount of \$1000 for not having investigated the Alberti affair when suspicion first arose concerning it. The Folkething was dissolved at the end of the ordinary session, the Radical Ministry hoping to secure a majority in the elections for a repeal or amendment of the National Defense measures, but the elections which were held in May went against the government. M. Zahle resigned and a new Ministry was formed on July 5 by M. Klaus Berntsen. N. T. Neergaard held the portfolio of Finance in the new Cabinet. King Frederick attended the funeral services of King Edward VII. in London.

DENNISON, JAMES. An American educator, died March 20, 1910. He was born in Royalton, Vt., in 1837. At the age of nine years he became partly deaf and was educated at the Hartford, Conn., school for the deaf. He was, for a short time, an editor at Flint, Mich., and removed to Washington at the invitation of his brother-in-law, Dr. E. M. Gallaudet, president of what is now Gallaudet College. He became principal of the preparatory school in this college and continued to hold this position until the beginning of the school year 1910.

DENT, FRANCIS. American Roman Catholic priest and writer, died November 20, 1910. He was born in Mulligan, Ireland, in 1840, and came to the United States with his parents at the age of nine years. He attended St. Francis Academy and was graduated from the College of the Franciscan Monks. After his

ordination he engaged in mission work among the Italians in New York City. He later was appointed Father Superior of the Franciscan Home at Winsted, Conn. He afterwards had charge of a church in Hartford. In 1878 he went to Rome, where he remained until 1906. He was the author of several books on religious subjects, one of which *The Temporal Domain of the Popes in the Divine Plane* won leather seals from Popes Leo and Pius.

**DESIGN, NATIONAL ACADEMY OF.** An institution of artists and sculptors, founded in 1825. With it has been combined in 1906 the Society of American Artists. The society includes academicians and associates. The aim of the Academy is to further the arts of design and since its foundation it has maintained schools with that object in view. Its schools are free to accepted students, the only limitation being that none but students who expect to follow art as a profession and who are under thirty years of age are eligible. The atelier system, by which each student remains under the direction of the same instructor during his entire course is in force except in special classes. The schools are in session from the beginning of October until about the middle of May of each year. At the annual winter exhibition of the Academy various prizes and medals are awarded. The Carnegie prize of \$500 awarded for the most meritorious oil painting in the exhibition by an American artist, portraits only excepted, was awarded in 1910 to William S. Robinson for his painting entitled "Golden Days." The Thomas R. Proctor prize for the best portrait in the exhibition was awarded in 1910 to Douglas Volk. The Isidor Memorial medal for the best figure composition painted by an American artist was awarded to Kenyon Cox. The Helen Foster Barnett prize for the best piece of sculpture shown in the winter exhibition, the work of an artist under 30 years of age, was awarded to Abastemia St. Leger Eberle. A description of the most notable pictures of the exhibition will be found in the article PAINTING. The Academy has made an effort for several years to obtain more satisfactory headquarters. A project was proposed in 1909 to erect a building in Central Park, New York, but public sentiment was against the idea and it was abandoned. At the end of 1910 suggestions were made that the city give the Academy the right to erect a building in Bryant Park, but nothing was done in furtherance of this proposition before the year closed. The officers in 1910-11 were as follows: President, John W. Alexander; vice-president, Herbert Adams; corresponding secretary, H. W. Watrous; recording secretary, C. C. Curran; treas-

urer, Francis C. Jones. These with Edwin H. Blashfield, Frederick Dielman, Cass Gilbert, Frederick W. Kost, Kenyon Cox, and Frederick Ballard Williams form the Council of the Academy.

**DEWING, OLIVER M.** An American physician, died March 15, 1910. He was born in Wilton, Conn., in 1862, and graduated from the New York College of Physicians and Surgeons. After practicing for a short time, he became a member of the medical staff of the Insane Asylum on Ward's Island, New York City. He was later appointed superintendent of Kings Park State Hospital, and after practically building up that institution, was transferred to the State Hospital at Flatbush. He was an authority on mental diseases and wrote extensively on the subject.

**DEXTER, HENRY MORTON.** An American clergyman, historian and editor, died October 29, 1910. He was born in Manchester, N. H., in 1846, and graduated from Yale College in 1867 and from the Andover Theological Seminary in 1870. From that year to 1873 he traveled abroad. He was ordained to the Congregational ministry and from 1873 to 1878 was pastor of the Union Church at Taunton, Mass. From 1878 to 1891 he was editor of the *Congregationalist*. In the latter year he relinquished his editorial work to devote his time to historical research and writing. He made many trips to England and Holland and was especially interested in the history of the Pilgrims and of the early American colonies. He was secretary and treasurer of the Committee of the National Council of the Congregational Churches of the United States, which, in 1891, erected and dedicated a bronze memorial tablet to John Robinson in Leyden, Holland. Among his published works are, *The Story of the Pilgrims, and England and Holland Pilgrims* (1905). He also contributed to magazines on historical subjects.

**DIRECT ELECTION OF SENATORS.** HISTORY OF THE MOVEMENT. Though the direct election of Senators was advocated in the constitutional convention of 1787, the honor of making it a live topic seems to belong to Andrew Johnson of Tennessee. He urged a constitutional amendment to this end in 1851 and in 1852 when a Representative, and as Senator just before the outbreak of the Civil War, and as President in two messages. Besides his messages, the subject was brought before Congress in nine resolutions between 1787 and 1872, of three of which Johnson was the author. When urged by James Wilson in the constitutional conven-

tion, the direct election of Senators received scarcely any support, as the present Senate report points out, though Mr. Wilson was admittedly one of the ablest men in the convention. The idea slept until 1826, when State constitutions and State governments as well as the Federal government were becoming more democratic. In that year a resolution was offered in the House of Representatives. It came up a second time in 1835, but was not urged again until 1850, when Senator Jeremiah Clements, of Alabama, offered a resolution providing for this change. After the reconstruction period the movement for direct elections became more persistent. No less than six resolutions for the necessary constitutional amendment were offered in each of the Forty-ninth and Fiftieth Congresses and in the first session of the Fifty-second there were twenty-five resolutions. The movement had its first success in the House of Representatives on January 16, 1893, when by a two-thirds vote a resolution for a constitutional amendment was sent to the Senate. The Fifty-seventh Congress in 1902 also gave a large majority to a similar resolution, the Fifty-third, Fifty-fifth and the Fifty-sixth having approved it by smaller majorities. In the Fifty-fourth Congress, on March 23, 1896, the change was favorably reported in the Senate, but was smothered in apathy or hostility.

This history of the movement for direct elections of Senators has been compiled by J. W. Perrin, who discusses the subject without taking sides in the *North American Review* for December, 1910. The demand for the amendment has become nation-wide during the last ten years. Mr. Perrin mentions the referendum votes on the subject in California and Illinois. In the former State 187,953 votes were cast for the amendment and only 13,342 against it. In Illinois a similar amendment received 451,319 votes and only 76,975 against it.

**PRESENT STATUS.** In December, 1906, delegates of twelve States met in Des Moines at the summons of Governor Cummins and adopted resolutions calling on the States to take steps to bring about a constitutional convention, seeing that the Senate had regularly suppressed resolutions for submitting an amendment to the States. A constitutional convention was deprecated in the Des Moines meeting and resolutions as a dangerous experiment, nevertheless with favorable action on the part of four more State legislatures Congress will be compelled to call a second constitutional convention to frame a constitutional amendment providing for the election of United States Senators by direct vote of the people. The following is a roll of the twenty-seven States that have made the demand: Alabama, Arkansas, Colorado, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Michigan, Minnesota, Montana, Missouri, Nebraska, Nevada, New Jersey, North Carolina, Oklahoma, Oregon, Pennsylvania, South Dakota, Tennessee, Texas, Utah, Washington, and Wisconsin. California and Wyoming have asked Congress itself to frame an amendment. These States only need to restate their demand. Georgia is fully committed to the principle, and a year ago Massachusetts came within a very few votes of adding its mandate, and final action will undoubtedly be taken this winter by the newly elected progressive legislature of that State. It is also believed likely that the legislatures of the States

of Maine, Ohio, and New York will speak in the winter of 1910, which will be more than sufficient. A bill was introduced in the 61st Congress, and the indications at the close of 1910 were favorable for its passage.

**DOCKS AND HARBORS.** Improvements of existing harbors and quays, as well as the inception of new works in various seaports are to be noted during the past year and as usual there was more work of this kind in progress in Europe than in America.

**BROOKLYN.** At Brooklyn, N. Y., the Bush Terminal was put into use, complete, and fully equipped for receiving and storing direct from freight car or boat, in lofts, all kinds of goods and raw materials. It is of equal advantage for outgoing shipments. A city of the character and extent of greater New York is too congested to allow economical transport of goods in wagon or truck loads through its streets; and the Bush Terminal, by providing large manufacturing or storage buildings on the water-front at South Brooklyn, enables shippers to bring a car or lighter to the building where the articles to be forwarded are packed or assembled at a minimum cost for transportation and insurance.

**DOVER.** In Great Britain, at Dover, a new landing-stage was built for the cross-channel traffic, just adjoining the Admiralty Pier. This work is 780 feet long, built of stone and concrete, and cost £50,000, nearly \$250,000. In connection with this, a sea-wall was under construction at the outer end of the pier, behind which a space of 11 acres was being reclaimed to be used as a site for a station to be built by the railways.

**BELFAST.** At Belfast, Ireland, the waterway was being enlarged to permit the safer launching of large ships. At the entrance to the port, West Twin Island was to be removed, which would leave a basin in which vessels up to 950 feet in length could be turned. This part of the improvement was estimated to cost £10,000 or almost \$50,000. The river was to be dredged so as to widen the channel at bottom to 400 feet at a depth of 32 feet. The dredged material was to be used to form an embankment and reclaim 72 acres along shore. A new graving dock that was under construction for seven years, was finished and is one of the largest in the British Empire. The total available length is 886 feet, width of entrance 96 feet, and depth at the centre 37 feet below the level of high tide. The pumping plant installed with it is of 3000 horse-

power and can empty the dock in one hour and a half.

**LIVERPOOL.** At Liverpool, the bar at the mouth of the Mersey is being dredged so as to give a channel 2100 feet wide and 32 feet deep at low water. During the year 1910 there were 18½ million tons of sand removed.

**SOUTHAMPTON.** At Southampton, a 16 acre wet dock was building to accommodate the largest ships in the transatlantic service. It is 1700 feet long, 400 feet wide, and has a depth of water of 40 feet at low tide.

**BORDEAUX. ST. NAZAIRE.** In France, at Bordeaux, a dry-dock was built that had an available length of 594 feet and is 108 feet wide at the entrance. A number of fair-sized vessels are built here, and the dock is of great advantage to the port. Farther up the coast, at the mouth of the river Loire, there is a very important shipbuilding yard at St. Nazaire. Here the new transatlantic liners *La France* and *Rochambeau* were built, as well as some of the largest warships of the French navy. A dock crane, movable on a track, was built and put in use at the fitting-out dock. It is electric motor driven and has a capacity of 150 tons. A dry-dock was completed having an available length of 738 feet, 98 feet wide on the bottom, and 115 feet wide at the entrance.

**SOUTH AFRICA.** There was completed a large dry-dock and work-shops at the Cape of Good Hope, Africa. The yard and shops are completely equipped to repair and fit out large vessels, and the Selborne dock is very large and of massive construction.

**NEW ZEALAND.** At Auckland, New Zealand, the so-called Queen's Pier was rebuilt and enlarged, the material used being reinforced concrete, which is about the only available thing that will resist the ravages of the teredo in these waters. Wooden piling is destroyed in a few months' time, in spite of the fact that attempts have been made to lengthen its life by the use of creosote and other preservatives.

**MEXICO.** In Mexico, one of the largest undertakings in harbor improvement was at the port of Manzanillo on the west coast, 500 miles south of Mazatlan and about half way between San Francisco and Panama. This place has a large shipping trade and is connected with the interior table-land of Mexico by railways. It has a large export grain traffic furnished in this way as well as important commerce of other kinds. The exposed situation of the town, however, made it necessary to build a breakwater of massive construction, behind which the harbor has been dredged and a sea-wall built, forming the basis of future improvements that will include the building of extensive piers and warehouses to accommodate the business and traffic that may reasonably be expected to follow the opening of the Panama Canal. The breakwater extends 1489 feet out into the Pacific, at such a location with respect to the coast line that the waves strike it at an angle of 36°, instead of 90°. From a quarry a few miles away, large granite blocks weighing from 30 to 60 tons were transported on a railway line built for the purpose, and laid down to form the base and foundation for this great wall. On the outer surface, next to the sea, concrete blocks, made in sizes of about 30 tons weight were laid, and on this a concrete cap was applied which forms a monolith of the full length of the breakwater, 27 feet wide and 12 feet high. At the base, the

wall is 315 feet wide, and owing to the depth of water at that place the whole structure is 87 feet high from base to crown. The harbor thus formed has been dredged to a uniform depth which even alongside the wharves is 28½ feet at low water.

The sea wall referred to above is 6133 feet long, built of granite and concrete; and behind this a large area is now being reclaimed by filling in the material dredged out of the harbor. A short distance back from the shore and too near the town there was a malarial, mosquito-breeding lake or swamp called the Cuyutlan Lagoon. This is now being drained by the construction of a ditch or sluiceway that is expected to put an end to this menace to the health of the community. These improvements have been going on for about twenty years, and are an evidence of the liberal policy of the Mexican Republic towards the development of trade and commerce.

**CONSTANTA.** At the Rumanian port of Constanta, or Kûstenje, on the northwestern shore of the Black Sea, some interesting and important improvements are now about completed. This is a very prominent port, and situated as it is, near the mouth of the Danube, the facilities for shipment of various commodities have been increased by the installation of the most modern types of elevators and bulk conveyors. Of the entire exports about 85 per cent. consist of grain, petroleum, and lumber. Two storehouses for grain, holding together about 2,600,000 bushels, are served by a belt conveyor running in an elevated structure on the dock front for a distance of 1870 feet. This conveyor can transfer 200,000 bushels of grain from cars to the bins or from a vessel to the bins in one hour.

For petroleum and its products 25 storage tanks are provided, each tank holding about 176,000 cubic feet of oil. The oil is received in cars that are pulled up an incline to an elevated track 110 feet above the docks and a valve with hose connection is provided at intervals of 10 feet in a pipe line laid along the track on which the cars stand. This pipe leads to the tanks and is supplied with suitable branch-pipes and stop-valves in order that any one of the tanks may be filled as required. A central generating station supplies direct current on the three-wire system at 220-440 volts. The prime mover is a 400 horse power Diesel engine using crude petroleum. All hoisting, unloading and conveying machinery is operated by direct current 440 volt motors; while the illumination of the docks and buildings is from the 220 volt circuit. The wharves and conveyors have been laid out on so liberal a scale that five large ships can load grain at one time.

The harbor itself is formed by three large breakwaters built of stone and concrete blocks, forming two harbors or basins of 35 and 148 acres extent, respectively, and the depth of water at low tide is from 26 to 30 feet.

**FLOATING DOCKS.** In 1910 the Vickers, Sons & Maxim Co., of Barrow-in-Furness, completed a large floating dock for the use of the Brazilian Navy for raising battleships. A dock of 6410 tons capacity was built for Liverpool by Swan, Hunter & Wigham Richardson, and one of 4000 tons was constructed for Berlin by the Messrs. Hamilton of Port Glasgow.

**DODGE, THOMAS H.** An American inventor and philanthropist, died February 12, 1910. He was born in Eden, Vt., in 1823. He was

the inventor of the cylinder printing press and for many years conducted a patent attorney's office. He acquired considerable wealth through inventions, chiefly in cotton machinery.

**DOLBEAR, AMOS EMERSON.** An American educator and inventor, died February 23, 1910. He was born at Norwich, Conn., in 1837, and graduated from the Ohio Wesleyan University in 1866. For several years following his graduation he was an assistant in chemistry at this institution, and was later professor of chemistry, holding this position until 1874, when he became professor of physics at Tufts College, where he remained until he was forced to retire on account of ill health in 1902. He perfected many notable inventions, including writing telegraph in 1864, magneto telephone in 1876, static telephone in 1879, and photographing with electric waves. Professor Dolbear claimed to have invented wireless telegraphy and in 1899 brought suit against William Marconi. He also claimed priority in the invention of the telephone, and for many years contested in the courts of the legality of the Bell patents, but was finally defeated. He was twice mayor of the city of Bethany, W. Va. Among his published writings are the following: *Chemical Tables; Art of Projecting; The Speaking Telephone; Matter, Ether and Motion; Modes of Motion; Natural Philosophy*, and many articles in scientific journals and the magazines.

**DOLLIVER, JONATHAN PRENTISS.** United States Senator from Iowa, died October 16, 1910. He was born in Preston county, West Virginia, in 1858 and graduated from the University of West Virginia in 1876. He studied law and in 1878 was admitted to the bar and opened a law office in Ft. Dodge, Ia. He was elected to the 51st Congress in 1889 and was re-elected to successive Congresses until 1901. In 1900 he was appointed United States Senator to fill the unexpired term of Senator John H. Gear. He was elected for the terms 1901 to 1907 and 1907 to 1913. Senator Dolliver was one of the most effective orators in the Senate. During the first years of his service he was identified with the conservative element first in the House and later in the Senate. In the Senatorial fight made by Albert B. Cummins against William B. Allison in 1908, Senator Dolliver supported Senator Allison, who was a strong exponent of party regularity. Senator Cummins later succeeded to the senatorship upon the death of Senator Allison and soon after Senator Dolliver became identified with the "insurgent" Senators, and he and Senator Cummins were perhaps the most aggressive opponents of the tariff and other policies of the Administration. In the Senate in the sessions of 1909-10 his speeches against the Payne-Aldrich tariff bill were considered by many to be the most effective and striking delivered against that measure. Senator Dolliver was an expert on tariff matters, for as a member of the House Committee on Ways and Means, in 1897, he was one of the framers of the Dingley tariff bill and he was the chief speaker in the House in support of that measure. To the charge of inconsistency made as a result of his antagonism to the Payne-Aldrich bill he invariably replied with the assertion that he was young in 1897. Senator Dolliver first attracted attention as an orator during the Blaine campaign of 1884. He was regarded as one of the finest speakers in public life. His death was largely the result of

overwork, especially in the congressional sessions of 1910.

**DOMESTIC RELATIONS COURT.** See NEW YORK, *Legislation*.

**DORR, R. C.** See LITERATURE, ENGLISH AND AMERICAN, *Political and Social Science*.

**DOUBLE RED CROSS.** See TUBERCULOSIS.

**DOMINICA.** An island of the British West Indies; one of the presidencies of the Leeward Islands (q. v.). Area, 304½ square miles. Population, 28,894. Births (1908), 1283 (754 illegitimate); deaths, 846; marriages, 144. Primary schools, 24, with 4806 pupils; government grant, £2232. Cultivated area, unascertained; sugar-cane, cotton, cacao, and limes are grown. Imports (1908), £153,114 (from Great Britain, £65,365; British colonies, £37,405; other countries £47,881; internal trade, £2463). Exports, £112,013 (to Great Britain, £58,971; British colonies, £8652; other countries, £41,770; internal trade, £2620). Tonnage entered and cleared, 746,640. One post-office. Revenue and expenditure for the year 1908-9, £40,500 and £36,541 respectively. Debt, March 31, 1909, £65,000. Administrator (1910), W. Douglas Young.

**DOMINICAN REPUBLIC.** See SANTO DOMINGO.

**DONOHUE, CHARLES.** An American jurist, died April 17, 1910. He was born in New York in 1825, and attended Columbia College grammar school. He began the study of law and was admitted to practice at the bar. He was elected Supreme Court Justice in 1874. He specialized in maritime law, and with the coming of the Civil War took up revenue cases, still doing much of his work in the United States courts and appearing frequently before the United States Supreme Court. At the close of the war he became active in local politics and was identified with Tammany Hall. He left the bench in 1889.

**DOVER DOCKS.** See DOCKS AND HARBORS.

**DOWDEN, JOHN.** A bishop of the Scottish Episcopal Church, died January 26, 1910. He was born at Cork, Ireland, in 1840, and was educated at Queen's College, Cork, and Trinity College, Dublin. He was consecrated priest in 1865. He was Donnellan lecturer at Dublin University in 1884, and was Select Preacher at that University in 1886, 1894, and 1895. After having served as curate and rector in several churches he became Pantonian Professor of Theology and Canon of St. Mary's Cathedral in Edinburgh. He was appointed bishop of Edinburgh in 1886. Among his published writings are the following: *The Celtic Church in Scotland; History of the Theological Literature of the Church of England; and The Workmanship of the Prayer Book*. He also edited the *Correspondence of the Lauderdale Family with Archbishop Sharp*.

**DRAINAGE. PROGRESS—1910.** In the United States the year 1910 witnessed greater activity in the improvement and reclamation of land by drainage and protection from overflow than any preceding year. It is estimated that drainage works under construction in 1910 in the United States will reclaim an area of 4,000,000 acres. The greater part of this is in the Mississippi River Valley in southeastern Missouri, Arkansas, Mississippi, and Louisiana, and in the Florida Everglades. Considerable areas

of swamp land in the South Atlantic States also are being reclaimed under State drainage laws, taxing the lands benefited for the cost of the work, usually in proportion to the benefits received. The lands are organized into drainage districts which sell bonds, build the works, and levy and collect the taxes to provide maintenance, interest, and sinking funds. The greatest activity in the drainage of farm lands to increase their productivity is in the upper Mississippi Valley, notably in Iowa. It is estimated that 2,000,000 acres in that State alone have been tilled during the year 1910. There is much activity in this line in Illinois, Indiana, and Kentucky, and also in New York and North and South Carolina in the East. This work is done under drainage districts, also, the districts building the outlets and the farm owners putting in the drains on their own farms.

**BREAKING UP HARDPAN.** In the western part of the United States, where irrigation is practiced, there has been a considerable extension of drainage to prevent the accumulation of surplus water from irrigation, and more especially for the removal of alkali from irrigated lands. In irrigated lands there is a tendency to the formation of a hardpan which prevents the circulation of the water through the soil, preventing proper drainage, thus aggravating the accumulation of alkali. Experiments made by the U. S. Department of Agriculture in California have demonstrated the effectiveness of blasting to break up this hardpan and allow the water used in irrigation to pass down into drains and leach out the injurious salts. These experiments show the possibility of reclaiming large areas which have hitherto failed to respond to efforts for their reclamation.

**NOVA SCOTIA.** The department of agriculture of Nova Scotia has under consideration a scheme for assisting the farmers of that province in draining their lands. Under this scheme the government is to make the plans and advance the money for the work. The farmer is to pay 7 per cent. of the cost of the drainage each year for about 25 years, when the work will be paid for. This plan is similar to that adopted by the Australian and New Zealand governments for aiding farmers in improving their lands.

**BELGIUM.** The Belgian government, also, is extending aid to the reclamation of wet lands. Where the principal object of the work is improvement in sanitary conditions the government is meeting the cost of the work. Where the object is improvement in agricultural conditions, the land owners must pay for it. This is similar to the work being done by the Italian government, under the law making large appropriations for aid to drainage for a long series of years ending in 1933.

**OTHER FOREIGN COUNTRIES.** The agricultural department of Iceland is experimenting in the reclamation and use of the great bogs of that country, which comprise about one-seventh of the entire area. So far, these experiments have not been successful. In Norway a society organized in 1902, for the purpose of promoting the reclamation of marsh lands, is engaged in making plans for the drainage of swamps, in conducting demonstrations, and in giving lectures on the subject. It is encouraging private initiative in every way possible. A Chinese syndicate is experimenting in reclaiming large areas of swamped and alkali lands in China, where an area of 140,000 acres of

badly alkali lands has been drained as an experiment. There are millions of acres of similar lands which can be reclaimed in the same way, and it is probable that this will prove to be the beginning of a great movement for the control of Chinese rivers and the reclamation of the lands overflowed by them. The great schemes for rehabilitating the valleys of the Tigris and Euphrates include the protection of lands from overflow, as well as irrigation, and some of this work was undertaken in 1910.

Throughout the world there is great activity in extending agricultural production. The greatest opportunities for extending cultivated areas lie in the lines of irrigation and drainage, and there is rapid progress in both lines everywhere.

**DRAINAGE, CANAL.** See **CANALS.**

**DRAMA.** Probably the keenest interest in dramatic affairs in the United States, during 1910 centered in the doings of the New Theatre of New York, the opening of which was the great event in the record of the previous year. The theatre was built at a large cost by a company of rich men whose ambition was to make it stand in this country for what the Théâtre Français represents in France and the Burg Theatre in Austria—a house which should set the standard of stage work. While the establishment was expected to pay its way, artistic rather than commercial success was to be the supreme aim. Mistakes have of course been made during the New Theatre's first year. A few plays have proved of no value, artistically or otherwise. While the stock company was away the house has been opened to outside organizations that have not helped its prestige. But upon the whole the directors of the enterprise have reason to congratulate themselves. There have been rumors to the effect that they are dissatisfied with the financial results and that the theatre itself has been found unsuited for comedy. Nevertheless what is done in the New Theatre has come to be recognized as something which playgoers in New York and the thousands from other cities must take into serious account. All that it does has been inspired by sincerity and a worthy aim. The stock company of the house comprises such excellent people as Miss Edith Wynne Matthison, Miss Rose Coghlan, Miss Jessie Busley, Mrs. Sol Smith, Miss Olive Wyndham, Messrs. A. E. Anson, Louis Calvert, Robert Bruning, Ferdinand Gottschalk, E. M. Holland and Frank Gillmore.

Early in the year *The Witch*, a gloomy play from the German of Wiers-Jensen, was produced with Mme. Bertha Kalisch, an actress of some power, in the leading rôle. It was too sombre. Another of the failures in this house came later when Miss Olga Nethersole and her own company presented Maeterlinck's *Mary Magdalene*. *Sister Beatrice*, also by the Belgian poet, had previously proved of much value. It is a so-called miracle play, in which a nun who forgets her vows is replaced for years in the convent life by the Virgin, who comes down from the altar for that purpose. When the erring sister returns, penitent and broken in spirit and body, the Virgin resumes her place. Miss Matthison in the title rôle gave a performance of admirable dignity and sweetness. Among the actors invited during the year to appear as guests with the New Theatre Company was Miss Annie Russell, who played as

Viola in *Twelfth Night* with Mr. Oswald Yorke as Malvolio and Mr. Calvert as Sir Toby.

The new Theatre's second year opened with Maeterlinck's fairly phantasia, *The Blue Bird*, an allegory of decided charm that filled the house for many weeks and was afterwards transferred to another theatre where it ran for several months. It is a tale in which children in quest of the Blue Bird, the symbol of happiness, have many fantastic adventures, most of them delightful by reason of the imagination displayed. A revival of Shakespeare's *Merry Wives of Windsor* proved to be rather lacking in the unctuous humor needed for the famous old farce. Neither Mr. Calvert, who played Falstaff, nor Miss Matthison, the Mistress Ford, nor Miss Rose Coghlan, the Mistress Page, seemed quite to catch the robust spirit essential to an effective performance of this classic frolic. Some of the stage pictures were admirable, but the performance needed distinction and could hardly be compared with the best of those of years ago in which the stage trappings were less pretentious.

Another New Theatre revival of some interest but again not wholly worthy of the house, was that of Meyer-Foerste's *Old Heidelberg*, a play first done here ten years ago in the original German and afterwards used by Mr. Mansfield, Mr. Boucicault and others. Mr. Frank Gillmore suggested fairly well the young man whose temporary escape from the etiquette of a petty German court to the student life of Heidelberg makes the play; and Mr. Gottschalk was admirable as the valet, Lutz. In other respects it has been better done in the past. But the stage pictures, the student revels, etc., were capital. Miss Jessie Busley was hardly adequate as the little maid with whom the young prince falls in love.

By all odds the best achievement of the New Theatre during 1910 was its production of Sir Arthur W. Pinero's picture of middle class English life, *The Thunderbolt*, produced in November. The play is not exactly a pleasant one. It shows the grasping avarice of a set of miserable people who seize their chance to despoil a girl of her rightful inheritance. When the plot is foiled by the discovery of a dead man's will—which incident constitutes the thunderbolt—the whole crew of vultures, male and female, become fawning supplicants. There is not much action, but dialogue of remarkable quality. At least a dozen parts require good work and the New Theatre Company covered itself with credit. The ensemble scenes, such as that which opens the play, a meeting of the heirs of the rich man and a discussion of the situation, was done with a perfection of detail that suggested the best work on the French and German stage. Mrs. Dellenbaugh, Miss Lawton, Miss Wyndham, Messrs. Calvert, Gottschalk, Bruning, Holland and Gillmore all deserve mention. A Shakespeare revival of some interest was *The Winter's Tale*, in which Miss Matthison appeared to advantage as Hermione, giving a portrayal of rare artistic grace and tenderness.

For purposes of record the production in the New Theatre of *Beethoven* may also be noted, although it was not done by the stock company. The play is a fantastic sketch from the French of René Fauchois, of suppositious incidents in the life of the great composer. Donald Robertson played the part of Beethoven and musical

excerpts from the nine symphonies and other works of the Bonn master were used with taste. The only Shakespearian revivals of any importance outside of the New Theatre were those made by Mr. E. H. Sothorn and Miss Julia Marlowe, who played for a month or more in their regular repertory, adding to it a production of *Macbeth* that deserved praise. Neither Mr. Sothorn as Macbeth nor Miss Marlowe as Lady Macbeth attained great heights, but they were sincere.

Of the serious plays of the year outside of the New Theatre one of the strongest, if also the most unpleasant, was Pinero's *Mid-Channel*, an English success in which Miss Ethel Barrymore appeared in this country. An acknowledged master of technique, the British playwright showed that he had lost none of his cunning. It is a sordid tragedy relating, sometimes with needless and repellant veracity, the story of a man and woman tied together without bonds of intellectual or sentimental sympathy. He is coarse, dull, dictatorial. She, more sensible of a void in their life, seeks relief in dissipation. Death ends a problem which was hopeless from the first. Except for occasional flashes of cynical wit, the atmosphere of the piece is one of unmitigated depression. Yet it is realism portrayed with dramatic power. It leaves a disagreeable flavor behind but is not apparently written for the sake of sensation only. Miss Barrymore, who played with little artistic restraint, showed that she has a capacity for emotional work of which she had heretofore given no hint. At the close of the year this actress was seen in pleasanter circumstances in a revival of the same author's amusing comedy, *Trelawney of the Wells*, playing the part of Rose with sincerity if no brilliancy.

A play entitled *The Faith Healer*, the last work of the late William Vaughn Moody, was presented by Henry Miller and failed, despite its excellent literary qualities, to impress the public. It dealt with the attempts of a wandering zealot to heal the sick by mental power. When this fanatic falls under the spell of an earthly love, he fancies that the power to cure deserts him. Although there are scenes of interest in the play, which suggests in atmosphere Björnson's *Beyond Human Power*, a drama of far greater weight, the general effect was depressing. Its main purpose, the instillation of a belief in the possibility of modern miracle, was hardly achieved. Also somewhat depressing was Mrs. Minnie Maddern Fiske's revival of Hauptmann's dream play, *Hannele*, often done here in German with beautiful effect. Notwithstanding Mrs. Fiske's sincerity and artistic instinct this actress was temperamentally unfitted for the mystic character sketched by the poet. The part, that of a workhouse waif who in dying sees all the glories of life that she has missed, requires a simplicity of treatment that Mrs. Fiske hardly suggested. A revival of Ibsen's *Pillars of Society* enabled Mrs. Fiske and her company to do better work and a little play from the German of Arthur Schnitzler called *The Green Cockatoo*, depicting incidents upon the night of the fall of the Bastille, proved to be a curtain raiser of uncommon interest.

Another Ibsen play was *Little Eyolf*, with which Mme. Nazimova opened a new theatre named after her. The Russian actress played the part of Rita Allmers, an abnormal creature,

like so many of the Ibsen fold, and perhaps a fit subject for an alienist, with fine touches. The idea of a mother who hates her child as a possible barrier between her and the man she loves is repellent and could not be sufficiently glossed by good acting to make the play other than unpleasant and a befuddling assemblage of weird impressions. Those persons who have studied the play as well as those who saw it acted must have remained much in the dark as to its meaning. There is a monstrous side to the woman Rita, but she also calls for pity, both aspects finding expression in Mme. Nazimova's performance. The actress had efficient support from Mr. Brandon Tyan, who played Allmers and from Miss Ida Conquest as Asta.

In the way of lachrymose agony a translation of Alexandre Bisson's *La Femme X*, produced in America as *Madame X*, delighted those play-goers who love to weep. An unfortunate woman whose life has been all that it should not be is brought to the bar of justice with her own son as her counsel. It is a melodrama of skillful construction in which the agony is laid on without stint. The better the acting the more painful it becomes. Miss Dorothy Donnelly's portrayal of the hopeless outcast received much critical commendation, and Mr. William Elliott did good work in the part of the son. Also an intense play, but calling for no deluge of tears, was Charles Klein's drama, *The Gambler*, based upon financial rascality. A bank president uses the money of his depositors in fighting other bankers who hope to ruin him. He goes to jail as the curtain falls, but carries with him the sympathy of the fair-minded persons in the play. Mr. George Nash in the leading part, Mr. Charles Stevenson and Miss Jane Cowl distinguished themselves. Mr. Theodore Robinson, one of the most competent veterans of the stage made something out of a dramatization by Eugene Presbery of Rex Beach's novel, *The Barrier*. The play follows the story pretty closely. The scenes are laid in Alaska and local color is happily used.

Still another drama that had much success was *Alias Jimmy Valentine*, in which H. B. Warner played the part of a reformed burglar who, when it comes to a question of showing his skill in opening safes and thereby denouncing himself or allowing an imprisoned girl to die, opens the safe and of course wins more than he loses. Mr. Warner played with such picturesque force as to keep the drama running for a whole season and will probably continue to play it for many seasons to come. Mrs. Leslie Carter found an opportunity in *Two Women*, taken from the Italian by Rupert Hughes, to play the dual part of saint and sinner. In the first part of the drama a saintly young wife dies; the husband, an artist, finds in an outcast the physical counterpart of the woman he has lost and succeeds in the work of regeneration. The public failed to find the process interesting. Sir Arthur Conan Doyle's *The Speckled Band* was a melodrama of the Sherlock Holmes stripe that left its admirers thrilled.

Other serious plays that need be mentioned for purposes of record only were Mrs. Patrick Campbell's production of Bataille's *Vierge Folle*, which she did as *The Foolish Virgin*; an adaptation of the same author's *La Scandale*, in which Kyrle Bellew appeared, and a picture of fast London life by Henry Arthur Jones called *We Can't Be as Bad as All That*. None

of these plays was of more than passing interest. There were, also, *The Deserters*, by Robert Peyton Carter, in which Miss Helen Ware made a pleasant impression; *Mother*, a pathetic sketch of homely life by Jules E. Goodman, in which Miss Emma Dunn succeeded; Eugene Walter's *Just a Wife* that gave Miss Charlotte Walker an indifferent chance to show her graceful self; and Mr. Lawrence Irving's production of *The Three Daughters of Monsieur Dupont*, a remarkable study of middle class French life by M. Brieux. Another play of foreign origin, *The Whirlwind*, from the French of Henri Bernstein's *Baccarat*, served for the debut of Mme. Marietta Olly, a Viennese actress who showed sound technical training.

In the field of light comedy and farce one of the popular plays of the year was a dramatization of Mrs. Wiggin's *Rebecca of Sunnybrook Farm*, a little sketch nicely done by Edith Taliaferro in the title rôle. Miss Marguerite Clark in *Baby Mine*, by Margaret Mayo, also pleased the public in a farcical series of adventures turning upon the necessity of providing at least one baby for an anxious father who finds that instead of one he seems to be responsible for three. *Mrs. Dot*, another comedy by the prolific Englishman, W. Somerset Maugham, afforded Miss Billy Burke an opportunity to show the limitations of her artistic powers. But in this as well as in a later production, *Suzanne*, her unquestioned beauty and ingratiating mannerisms counted for something. Neither comedy was of importance. Of more significance was *The Inferior Sex*, by Frank Stayton. A rich woman-hater who has fled to sea on his yacht in order to get away from women and write a book on the inferior sex, picks up a small boat containing a girl and has to keep her aboard for a week with the result that when she finally goes, he follows. The little play has some bright dialogue and was nicely done by Miss Maxine Elliott and Mr. Arthur Byron.

From the German came *The Concert*, the clever study of an irresponsible musical genius that was admirably interpreted by Leo Ditrichstein. Louis N. Parker's *Pomander Walk* was a delightful idyl of Georgian days, more a series of sketches than a play. There were also *Love Among the Lions*, in which a promising young Englishman, A. E. Matthews, made his debut; Mr. F. Anstey's *Brass Bottle*; James Forbes's *The Commuters*; *His Humble Servant*, well played by Mr. Otis Skinner; *Nobody's Widow* by Avery Hopgood; and *Electricity*, in which Miss Marie Doro figured. From the French of MM. de Caillavet and de Flers was *Decorating Clementine*, a rather thin comedy well played by Miss Hattie Williams, G. P. Huntley and Ernest Lawford. Miss Annie Russell was seen in a little play of some merit but utter improbability called *The Impostor*. A London girl of supposedly much charm of personal manner, finding herself penniless in the street, asks a stranger to lend her a sovereign. Circumstances arise that result in this semi-outcast being received under false colors as an honored guest in an aristocratic household. The satire upon social prejudice is not without interest, but there was not enough strength in the play to hold public attention for long.

A farce that met with popular welcome was *Get Rich Quick Wallingford*, by George M. Cohan. The satire upon people who want to make

**FOUR PLAYERS PROMINENT IN 1910**

৪৭০

much of nothing seemed to strike a sympathetic chord, notwithstanding the torrent of slang in which the ideas are expressed, or perhaps because so large a part of the play-going public understands slang better than anything else. Another satire, this time upon the Kentucky mountain feuds, entitled *The Cub*, was made amusing by Mr. Douglas Fairbanks, who, as a young reporter, plunges into the heart of a desperate feud and not only escapes with his life but carries off a bride. Miss May Irwin in a farce called *Getting a Polish* and Mr. Sam Bernard in *He Came from Milwaukee* added to the gaiety of the public which enjoys the lightest kind of entertainment. Of more ambitious character was *Mr. Preedy and The Countess*, in which Mr. Weedon Grossmith, the English comedian, was amusing.

Several revivals met with favor. Oscar Wilde's fairly clever *The Importance of being Earnest* was one, and Robertson's *Caste* another. In the latter Miss Marie Tempest's Polly and Mr. G. P. Huntley's Eccles were good enough to recall memories of years ago and make one forget how faded is the old comedy. The revival of *Trelawney of the Wells* has already been mentioned. Mr. William Gillette appeared with success in a number of plays of his own, such as *Secret Service*, *The Private Secretary*, *Too Much Johnson*, etc.

Of the foreign players who visited the United States during 1910 Mme. Sarah Bernhardt is pre-eminent by virtue of achievement and personality. At the age of 67 years and a great-grandmother, she came to play what to most women at the height of their powers would be an exhausting engagement. For weeks at a stretch in Chicago, New York and elsewhere this remarkable woman appeared sometimes ten times a week in dramas and plays requiring a tremendous expenditure of emotional force. For a month in New York she kept up the strain without showing any marked deterioration in the quality of her work. She was still able to suggest on the stage all the allurements of a woman half her age. Her technical command of her art remains as perfect as ever, and in the parts which she has made her own, such as Marguerite in *Camille*, *La Tosca* and *Fédora* she still stands without a rival. During her American engagement Bernhardt appeared for the first time in this country in *Jeanne d'Arc*, a drama by Émile Moreau, which was more curious than inspiring. It is chiefly devoted to the trial of Jeanne at the hands of her English captors. Mme. Bernhardt suggests the mystic exaltation essential to the part, but it is nothing by which she will be remembered. Another play in which she had not heretofore been seen outside of Paris was Rostand's *La Samaritaine*, a poetic fantasy having for its protagonists Christ and the woman of Samaria. Notwithstanding the sincerity and reverence with which the theme is treated, public sentiment is against such an exhibition.

A curiosity of Mme. Bernhardt's New York engagement was the production of *Judas*, a play written in English by John De Kay, an American, and translated into French. Mme. Bernhardt, who has played Hamlet and who is even said to have considered Falstaff, assumed the part of Judas, the disciple who betrayed Christ. The drama itself is a queer mixture of politics, love and religion which would be offensive if it

were not so puerile. Judas is made a fanatic who loves Mary Magdalen. When the Magdalen turns from him to follow Christ he gives way to raging jealousy and betrays his Master. Why Mme. Bernhardt should have consented to masquerade in this worthless affair remains a mystery. Her Judas, which she played in listless fashion, was almost as insignificant as the piece itself. Mme. Bernhardt gave several performances of Bisson's *La Femme X*, showing her usual skill in depicting a despairing woman. The part was originally written for her, although it fell to Mme. Réjane to play it first in Paris. Once or twice during her New York engagement Mme. Bernhardt dropped the tragic mask to appear in comedy. A most delightful treat was her performance in Zancols's *Les Bouffons* which Miss Maude Adams played here some years ago as *The Jesters*. The French actress and her company did wonders with it.

Mr. Ernst von Possart, the noted German actor and director of the Munich Court Theatre, returned to this country after an absence of many years and delighted German audiences with his admirable work in such plays as *Freund Fritz*, *The Merchant of Venice*, *Nathan der Weise*, etc.

During the year in England *The Piper*, by Josephine Preston Peabody (Mrs. Lionel S. Marks), had its first production in Stratford. This was the play which took the Stratford prize of \$1500 from 300 competitors. It is a poetic treatment of the story told in Robert Browning's well-known poem. *Grace*, by W. Somerset Maugham, struck a serious note and showed how a woman may find happiness even with a dull mate whom she cannot adore. *Nobody's Daughter*, by George Parton (Miss Symonds), was a domestic comedy of more than common cleverness. Sir Arthur Pinero's *Healer's Mystery* was a failure, and *Helena's Path*, by Messrs. Hope and Lennox, fared no better. *A Single Man*, by Hubert H. Davies, was found lacking. The ubiquitous Hall Caine tried *The Bishop's Son*, a dramatization of his "Deemster," and a melodrama called *The Eternal Question*. *Justice*, by John Galsworthy, a strong but depressing drama, made sufficient impression to cause official investigation of the legal abuses set forth. *The Fighting Chance*, a war play, won popular favor. Altogether the dramatic year in Great Britain offered little of vital importance.

FRANCE. Rostand's *Chantecler* was of course the sensation of the year in France. While the dramatic value of this fantasy in which the barnyard denizens play a drama of love and jealousy may be doubted, the beauty of the piece as literature is unquestioned. The best French critics assign it no permanent place upon the stage. The acting and the stage devices employed at the Porte St. Martin Theatre were alike admirable. At the Théâtre Français the play of the year was, perhaps, *Comme ils sont tous* (All Men are Alike), by MM. Aderer and Ephraïm, a play of which the moral is that in the matter of sentiment husbands must not be asked to give much and that wives should forgive and forget. Pierre Wolff's satirical comedy, *Marionnettes*, also seen at the Français, is based upon the familiar situation of a young girl whose simple virtues weary her husband. When she becomes a dazzling Parisian butterfly, he awakens to her charm. Bourget's *Un Cas de Conscience*, a comedy by Romain Coolus

called *Les Bleus de l'Amour*; *Le Petit Dieu*, by Louis Artus; *L'Imprévu*, by Victor Margueritte; and Mlle. Leneru's philosophical drama, *Les Affranchis* were some of the other French plays of the year that attracted notice.

Also to be noted are Alfred Capus's *L'Aventurier*, the story of a self-made man who conquers social prejudice; Tristan Bernard's *Danseur Inconnu*; Courteline's *Boubouroche* and Zamacois's *Fleur Merveilleuse*, a fantastic piece in the style of *Les Bouffons*. Bataille's *Vierge Folle* sketches the career of a neurasthenic girl who ends by suicide. Posthumous plays of interest were Balzac's *L'École des Ménages*, a study of marital relations, and Henri Becques's *Polichinelles*, a realistic and unpleasant drama. Balzac's *César Birotteau* was made into a play and produced with some success. *Hamlet* and *Jules César* were important Shakespearean revivals. René Fauchois, the author of *Beethoven* (see YEAR BOOK, 1909), created a sensation by attacking Racine in a lecture that was bitterly resented. Among books dealing with theatrical topics were the *Mémoires* of the veteran actor, Got, and a *Vie Sentimentale de Rachel*, by Mlle. Thomson.

GERMANY. On the German stage a drama entitled *Sold*, by the Russian author, George Erastov, made a deep impression. *The Moloch*, also by a Russian, Leo Berensky, was produced in Berlin with some success. Hermann Bahr's comedy, *The Children*, also met with a favorable reception. See GERMAN LITERATURE.

**DRAPEE, WILLIAM FRANKLIN.** An American manufacturer and diplomatist, died January 28, 1910. He was born in Lowell, Mass., in 1842 and was educated at the common schools and an academy. He enlisted in 1861 in the 25th Massachusetts and served throughout the war, becoming lieutenant-colonel and brevet brigadier-general of volunteers. After the close of the war he engaged in the manufacture of cotton machinery, in which he was successful. He was a member of Congress from Massachusetts from 1892 to 1897, and from the latter year until 1900 was United States Minister to Italy. In 1909 he published an interesting book of reminiscences.

**DREDGING.** A powerful clay-cutting suction dredge was put in service on the Upper White Nile and showed its ability to cut channels at a rapid rate. The vessel had a flat-bottomed, rectangular shaped hull, 162 feet long x 28 feet beam, and was propelled by a paddle wheel at the stern. The working end of the hull carries a frame or movable suction tube, on the front of which is mounted a heavy steel rotary cutter. This cutter, as well as the centrifugal pump working in connection with it, is driven by a 700 horse-power triple expansion engine to which steam is supplied by Babcock and Wilcox water-tube boilers. Near the stern of the vessel, on either side, steel anchors are secured to fastenings that can move in slotted castings and allow the boat to swing from side to side through a small angle, while holding her so as to offer resistance to going backwards when dredging. By means of these spuds or flexible anchors, a channel can be dredged 150 feet in width and 25 feet in depth without changing the vessel's position. The mud and spoil sucked up is delivered through a pipe supported on pontoons to any desired point.

A dredge of 2224 tons capacity was constructed in Great Britain for Argentina. This

of course is not to be compared in size with the 10,000 ton leviathan of the Mersey Harbor Board and other British dredges, but shows the attention that harbor work in South America is attracting.

**DREADNOUGHTS.** See BATTLESHIPS and NAVAL PROGRESS.

**DEY DOCKS.** See DOCKS AND HARBORS.

**DEY WINES.** See LIQUORS, FERMENTED AND DISTILLED.

**DUBOC, CHARLES ÉDOUARD.** A German author of French extraction, died in April, 1910. He wrote under the pseudonym "Robert Waldmüller." He was born in Hamburg in 1822, son of Edouard Duboc author of *Dignité de l'Homme*. He wrote a great number of poems, novels and reminiscences, some of which became very popular. He also wrote dramas and translated into German the poems of François Coppée, and Alfred Tennyson's *Enoch Arden* and *In Memoriam*. Among his novels are *Leid und Lust* (1874); *Darja* (1884) and *Liebesstürme*. He wrote also the tragedy, *Brunhilde* (1873), and the drama *Die Tochter des Präsidenten* (1880).

**DUGMORE, A. R.** See LITERATURE, ENGLISH AND AMERICAN, *Travel and Description*.

**DUMA.** See RUSSIA, *History*.

**DUNANT, JEAN HENRI.** A Swiss author and philanthropist, died October 31, 1910. He was born in Geneva in 1828. He inherited a large fortune and during the battle of Solferino in Italy in 1859 conceived the idea of an international agreement for the care and protection of those wounded in battle. His conception included the idea of pledging the nations to regard as neutral all sick and wounded combatants and all persons caring for them, and through the coöperation of the Swiss Federal Council he brought about an international conference at Geneva in 1863, at which 16 governments were represented. From this conference grew the International Red Cross Society. This meeting was followed in 1864 by the Geneva Convention, at which time articles of agreement were signed by twelve governments. The Red Cross flag was adopted, an international committee was provided and it was agreed that each country should have its own national Red Cross organization. From the twelve governments originally signing the agreement, the number afterwards grew to forty. M. Dunant spent his fortune in perfecting Red Cross organizations, and in 1901 he was awarded the Nobel prize for peace. He was the author of several books including the *Souvenir de Solferino*, which ran through many editions; *Fraternité et Charité Internationales en temps de guerre* (1st and 7th editions, 1864); *l'Esclavage chez les Musulmans et aux Etats-Unis de l'Amérique*, (1863); *La Renovation de l'Orient* (1865). In his later years he received a pension from the Empress of Russia.

**DUNKERS or DUNKARDS.** See BRETHREN, CHURCH OF THE,

**DUNNE, EDWARD JOSEPH.** American bishop of the Roman Catholic church, died August 5, 1910. He was born in Tipperary, Ireland, in 1848, and in the following year his parents removed to the United States, settling in Chicago. He was educated at the College of St. Mary's of the Lake, and studied theology at the Seminary of St. Francis de Sales of Milwaukee, and St. Mary's of Baltimore. He was ordained priest in 1871. From 1875 to 1893 he served as assistant pastor of All Saints Parish, Chicago. In the

latter year he was consecrated Bishop of Dallas, Texas.

**DURALIUM.** See **CHEMISTRY, INDUSTRIAL**, paragraph *Alloys*.

**DUTCH EAST INDIES.** Colonial possessions of the Netherlands lying between Australia and the continent of Asia.

**AREA, POPULATION, ETC.** Area and population (necessarily approximate only) are given below:

	Sq. miles	Pop. end of 1905
Java and Madura.....	50,775	30,098,008
Island of Sumatra:		
Sumatra, West Coast....	31,788	1,721,772
Sumatra, East .....	35,480	568,417
Benkulen .....	9,436	204,269
Lampongs .....	11,358	156,518
Palembang .....	53,716	796,852
Atjeh (Achin).....	20,549	552,175
Riau-Lingga Archipelago....	16,378	112,216
Banca .....	4,473	115,189
Billiton .....	1,870	36,853
Borneo, West Coast.....	56,060	450,929
So. & East Dists.....	157,585	782,726
Island of Celebes:		
Celebes .....	49,405	415,499
Menado .....	22,176	436,406
Molucca Islands .....	44,038	407,906
Timor Archipelago .....	17,782	308,600
Bali and Lombok .....	4,063	523,535
New Guinea to 141° E. long.....	152,428	200,000
Total, 1905.....	748,340	128,000,000
Total, 1900.....		37,734,000

Europeans and assimilated persons numbered (1905) 80,910; Chinese, 563,000; Arabs, 29,000; other Orientals, 23,000; natives (about), 37,000,000. Births (Java and Madura and outposts) among Europeans and assimilated persons (1906), 2659; deaths, 1812; marriages, 997. Principal towns of Java: Batavia (the capital), with 138,551 inhabitants; Surabaya, 150,198; Samerang, 90,600. Of Sumatra, Palembang, 60,985; of Borneo, Banjarmasin, 10,708; of Celebes, Macassar, 26,145. There were (1907) 221 elementary schools for Europeans, with 25,054 pupils; for natives, 2229, with 251,439; for foreign Orientals, 478, with 12,426. Religious liberty prevails.

**PRODUCTION, COMMERCE, ETC.** Area (1907) under rice, 5,385,154 acres; corn, cotton, etc., 5,346,667; sugar-cane, 355,306; tobacco, 344,872; indigo, 35,429. Area under coffee not given; under rubber (estimated) 1907, 70,000 acres; 1908, 90,000; 1909, 120,000. Many coffee plantations have been replanted to rubber in the past two years. Production (1907) of sugar, 1,025,801 tons; coffee, 55,009,878 lbs. (1906, 101,819,600); cinchona (1906), 6,065,412 kilos; tobacco (1907), 61,313,212 kilograms; tea (Java), 11,494,665 kilos; indigo (Java, 1906), 289,527; cacao (Java, 1907), 1,382,149. Yield of tin mines (1907-8), 15,807 tons; of coal mines, 418,284 tons; oil yield (1907), 1,328,892,000 litres; diamond mines were opened up in southern Borneo early in 1910. Imports and exports in 1907 were valued at 247,270,702 and 364,558,145 guilders respectively (1 guilder=40.2 cents); in 1908, 280,562,000 470,714,000. Vessels entered (1907), 4143, of 3,400,878 tons. Miles of railway (1908), 3198 (2623 in Java, 575 in Sumatra); of telegraph, 8800. Telegraph offices, 569; post-offices, 1661.

**FINANCE AND GOVERNMENT.** Revenue and expenditure for four years are given in thousands of guilders:

	1906	1907	1908	1909
Revenue .....	169,340	185,331	189,511	181,540
Expenditure .....	167,951	173,846	191,083	193,939

Of the revenue in 1909, 41.9 per cent. was furnished by taxes; 24.6 by the opium and salt monopolies; 41.1 by sales of coffee, cinchona, tin, coal, rubber, etc.; diverse sources, 19.4. Of the annual expenditure, 25 per cent. is for defense and 25 per cent. for administration. The budget for 1910 estimates the revenue and expenditure at 194,318,330 and 218,335,062 guilders respectively. The governor-general (1910, A. W. F. Idenburg) is assisted by a council of five members.

The colonial army numbered (January 1, 1909) 35,208 officers and men (10,785 Europeans); 17 effective vessels, aggregating 23,159 tons, were stationed in East Indian waters.

**DUTCH GUIANA, or SUBINAM.** A Netherlands colony on the northern coast of South America. Area, between 46,000 and 49,000 square miles. Population (exclusive of negroes in the forest tracts) in 1908, 81,038. Capital, Paramaribo, with 34,962 inhabitants. Schools (1907), 60, with 7574 pupils. Production (1907) of sugar, 11,929,914 kilograms; cacao, 1,386,787; coffee, 236,560; rice, 1,510,911; corn, 707,165; bananas, 397,758 bunches; rum, 859,249 litres; molasses, 280,852 litres. Imports (1907), 6,903,608 guilders (1 guilder=40.2 cents); exports, 5,888,567 (gold, 1,427,418). Vessels entered, 211, of 114,664 tons; cleared, 209, of 113,654. Local revenue (1909), 4,051,350 guilders; expenditure, 4,874,329; subvention, 822,979. Governor (1910) R. D. Fock.

**DWIGHT, JONATHAN.** An American engineer, died November 28, 1910. He was born in 1831 and graduated from Harvard College in 1852. After leaving Harvard he went to West Point and studied civil engineering. He practised his profession in the west and helped build several lines of railway. In 1861 he settled in Madison, N. J., and thereafter practised almost wholly as a consulting engineer. He was for a time one of the chief engineers of the New York Central Railway. He had charge of laying the foundation of the Statue of Liberty in New York Harbor.

**DYER, NEHEMIAH MAYO.** A rear-admiral of the United States Navy (retired), died, January 27, 1910. He was born at Provincetown, Mass., in 1839, and was educated in the public schools. He followed the sea from 1854 to 1859, and was in mercantile employment from 1859 to 1861. In the latter year he enlisted in the 13th Massachusetts Volunteers, and in 1862 was transferred as acting master's mate. He was promoted for gallant service to acting ensign in 1863 and acting master in 1864. In 1868 he was commissioned lieutenant in the regular service and in the same year was made lieutenant commander. He became commodore in 1883, captain in 1897, and rear admiral, retired, in 1901. During the Civil War he served at the Navy Yard of Boston and on various vessels, participating in the battle of Mobile Bay and the surrender of Fort Morgan. He was on various duties afloat and ashore until the outbreak of the Spanish-American war. He participated

in the Battle of Manila Bay, May 1, 1898, as second in command to Admiral Dewey. He was advanced seven numbers in rank for eminent and conspicuous conduct in this war.

**DYESTUFFS.** See CHEMISTRY.

**DYNAMICAL GEOLOGY.** See GEOLOGY.

**DYNAMO-ELECTRIC MACHINERY.** No new types of electrical machines were brought out in 1910 and the most noteworthy progress was in the direction of units of enormous size, especially turbo-alternators. Machines of 15,000 kilowatts have been placed in service, designs for 20,000 kilowatt units have been prepared and makers have announced their entire readiness to undertake the production of 25,000 kilowatt units. The immense machines owe their advantage to their lower cost per kilowatt of capacity and the reduction of labor costs in stations rather than to great gains in efficiency. The enormous output of power which these machines supply for momentary periods when short circuited, exceeding in some cases 100,000 kilowatts, makes the problem of protection peculiarly difficult. In some instances reaction coils of extremely rugged design have been placed in series with the armature windings to limit the short-circuit current.

The advance in the design and construction of transformers was exceptional, with a distinct trend toward the use of three phase units. These have now reached the immense size of 14,000 kilovolt-amperes and are built for voltages up to 140,000. Improved methods of oil circulation have made possible the increase of self-cooled transformers to a maximum size of 2000 kilovolt-amperes, as compared with 800.

No new types of motors were produced but the production of small and moderate sized motors for industrial installation exceeded all previous records. While the bulk of the industrial load is carried by direct current and induction motors the increase in the use of single phase commutator motors was great. No effective type of adjustable speed alternating current motor has yet appeared on the market, but an experimental type of three phase commutator motor was developed which gives promise of becoming a worthy rival of the direct-current shunt motor in this important field.

An important recommendation was made by the International Electrotechnical Commission at its Brussels meeting of 1910 to the effect that both generators and motors be rated hereafter in watts rather than horsepower.

The design of a 20,000 kilowatt generating unit, referred to above, has been carried out in the construction of two machines that will be put in service in the first few months of 1911 by the Commonwealth Edison Company, Chicago, in a station approaching completion to be called the Northwest Station. The design is similar to the 14,000 kilowatt units already in use in the Quarry Street Station in the same city, which are 3-phase, alternating current, revolving field generators on vertical shafts, direct coupled to Curtis five-stage steam turbines. Some of these machines are built for 9000 volt, 25 cycle energy, and the other group for 12,000 volt, 60 cycle.

**EARTH, AGE OF.** See GEOLOGY.

**EARTHQUAKES.** The list of earthquakes which were recorded in the press and by seismological stations during 1910 included only a few of first importance, and the year, like its predecessor, was comparatively free from disasters attributable to such disturbances. There appeared to be no lack of interest, however, in the study of earthquake phenomena that was so stimulated by the events of the few previous years. This department of geology, as a consequence, has developed into a practically new science, with its own methods, instruments and corps of observers. The large number of seismological stations now established in the different countries will make possible a systematic campaign of investigation from which valuable results may be expected.

The one formidable catastrophe of the year was incident to the Costa Rican earthquake of May 4, when the towns of Cartago and Paraiso were almost completely laid waste. The loss of life was estimated by officials of the country at over 1000 and the property damage at about \$25,000,000. The main disturbance was preceded by a long series of monitory tremors which seem to have been initiated by a sharp shock on April 13 that was especially noticeable at San José, the capital. Many of the urban dwellers had taken timely warning and sought shelter in the open before the violent earthquake came, so that the mortality was comparatively small in view of the completeness of the devastation. Clouds of dust, a heavy roar like thunder and temporary darkness, as usual, were accompanying features of the disaster, which was further accentuated by fire and later by a deluge of rain. The Carnegie Peace Palace, recently erected in Cartago, shared in the ruin.

Iceland was shaken, on January 22, by an earthquake that was transmitted long distances but did little damage. It may have been of submarine origin. A moderately heavy shock was reported on June 7 as felt at Naples, Benevento and other places in southern Italy; some damage to property resulted. Slight shocks were felt on June 16 in many parts of the Iberian peninsula and North Africa. The peninsula of Peloponnesus was shaken by a heavy earthquake on December 29, which inflicted much damage. The minor disturbances, of which the most were noted only by seismological stations, need not be mentioned.

**CALIFORNIA EARTHQUAKE.** The second volume completing the work of the commission appointed for the investigation of the California earthquake of April 18, 1906, was published by the Carnegie Institution. In this volume the mechanics of the earthquake are discussed by H. F. Reid. It consists of a first part on the phenomena of the megaseismic region, a second part on the instrumental records of the disturbance and an appendix on the theory of the seismograph. One of the most important features of the earthquake was the permanent displacement along the San Andreas fault; the shift amounted to no less than six metres, the southwestern side of the fault moving that distance northeast. The accumulation of strain preceding the actual rupture is believed to have gone on for about a century. In this connection Reid considers the possibility of predicting earthquakes by measuring the development of strains in fault zones. A plan proposed is to build a line of pillars, a kilometre or so apart,

at right angles to the direction of the fault; geodetic measurements at intervals of a few years would then indicate the growing distortion of the line due to accumulating stress. A strong shock might be expected when the angular strain attained a magnitude of one two-thousandth. It seems probable that a long period of time will elapse before another important earthquake will take place along the San Andreas rift, although sharp disturbances may occur from neighboring faults. In the discussion of the seismographic records of the earthquake, the author states that they indicate clearly the different paths pursued by the preliminary vibrations and the main waves, the first and second preliminaries being transmitted through the earth and the main waves around the earth, as has been previously surmised. Observations of the different phases, however, cannot be relied on at stations situated over 100 degrees of arc from the zone of disturbance for first preliminaries or over 125 degrees for second preliminaries. Hence the need is for more delicate instruments which will magnify the vibrations not less than 100 times. Stations should also be equipped with instruments for recording the vertical component of motion.

**EAST AFRICA.** See **BRITISH EAST AFRICA**; **GERMAN EAST AFRICA**; **PORTUGUESE EAST AFRICA**.

**EATON, W. P.** See **LITERATURE, ENGLISH AND AMERICAN, Poetry and Drama**.

**ECKERT, THOMAS THOMPSON.** An American financier and soldier, died October 20, 1910. He was born in St. Clairville, Belmont County, Ohio, in 1822. His father was a farmer and he received only the education possible in his surroundings. While he was still a boy the principle of telegraphy was discovered by Samuel F. B. Morse. He became interested and decided to go East to take advantage of what he conceived to be an extraordinary business venture. In 1847, after a hard struggle, he reached New York, where he learned what there was to be learned of telegraphy in those days, and then went back to Ohio to supervise the Ft. Wayne railway extension of what was then the newly organized Western Union Company's Line. He stayed with this company until 1859, when he went to North Carolina to search for gold. He was there when the Civil War broke out, and returned to Washington where he was placed in charge of the military telegraph office by Col. Thomas Scott. As director of the government's wires to the front he achieved a great work. He enjoyed the implicit confidence of President Lincoln and Secretary Stanton. As a reward for his service he was brevetted lieutenant-colonel in 1864 and subsequently his rank was raised to that of major-general. In the same year he was appointed to be assistant-secretary of war, an office which he filled until the close of the war in 1866. He then resigned to accept a position as general superintendent of the eastern division of the Western Union. At this time this company was in its period of greatest extension and was absorbing companies which had been hitherto keen rivals. The trans-continental lines were completed and the great project of linking America with Europe by way of Behring Straits and Siberia had been put under way, when the successful laying of the first Atlantic cable stopped any further work on this undertaking. In the early part of 1870, General Eckert, as general superintendent,

coped successfully with the great strike of the Telegraphers' Protective League. During the fight for control between the Western Union and the Atlantic and Pacific companies in 1875, he was elected president of the latter company. He returned to the Western Union when that company succeeded in buying up the stock of its rival. In 1893 he was elected president of the Western Union, a position which he held until the time of his retirement in 1902.

**ECLIPSES.** See **ASTRONOMY**.

**ECOLOGY.** See **BOTANY**.

**ECONOMIC ASSOCIATION, AMERICAN.** A learned society, founded in 1885 for the encouragement of economic studies and the publication of papers thereon. The association holds annual meetings in the latter part of December in different cities of the United States. The meeting in 1910 was held at St. Louis, beginning December 27, and closing December 30. The following topics were discussed, the more important ones being the subject of special sessions: Economic Aspects of Immigration, Money and Prices, The Problem of Poverty, A Century of Ricardianism, Canals and Waterways, and Railway Rates. In conjunction with the meeting of the association were held meetings of several kindred associations, including the American Political Science Association and others. A joint session of the first named societies met on December 27, and presidential addresses were delivered by Dr. Edmund J. James on the Economic Significance of a Comprehensive System of National Education, and by Dr. Woodrow Wilson, president of the American Political Science Association. The sessions of December 28 were devoted to Money and Prices, the Ricardo Centenary and Accountancy. Papers were read by Professor J. Lawrence Laughlin of the University of Chicago, Professor Irving Fisher of Yale University, Mr. A. D. Noyes of the New York *Evening Post*, Professor Jacob H. Hollander, Johns Hopkins University, Dr. James Bonar and others. The session of December 29 was devoted to Canals and Railways, Problems of Immigration and to a joint session of the American Economic Association and the American Association for Labor Legislation. Papers were read by Professor Emery R. Johnson of the University of Pennsylvania, Professor T. N. Carver, of Harvard University, Professor J. A. Field, University of Chicago, and Professor J. Allen Smith of the University of Washington. At the joint session of the American Economic Association and the American Association for Labor Legislation, the following topics were discussed: Industrial Accidents and Industrial Diseases, Lead Poisoning in Illinois, Industrial Diseases in America, Voluntary Indemnity for Injured Workmen, Compulsory Compensation for Injured Workmen, Progress and Next Steps in Workmen's Compensation. The Session of December 30th was devoted to a joint session with the American Political Science Association on the subject of Taxation and on the subject of Monopolies. Papers were read by Professor T. S. Adams of Washington University, Professor H. J. Davenport of the University of Missouri, Dr. Richard T. Ely of the University of Wisconsin and Mr. John Martin of New York. The membership of the association in 1910 was about 1500. The association issues many publications, including many volumes of economic studies which are of great value. At the meeting in 1909 it was

decided to establish not later than January 1, 1911, a new Economic Journal to be known as the *American Economic Review*, to be in charge of an editor elected by the association, and eight associate editors. The officers for the year 1910 were: President, Edmund J. James, University of Illinois; Vice-President, Frank L. McVay, University of North Dakota; Herbert J. Davenport, University of Missouri; Alvin S. Johnson, University of Chicago; Secretary and Treasurer, T. N. Carver, Harvard University.

**ECONOMIC ENTOMOLOGY.** See ENTOMOLOGY.

**ECONOMIC GEOLOGY.** See GEOLOGY.

**ECUADOR.** A South American republic on the Pacific coast between Colombia and Peru. The capital is Quito.

**AREA AND POPULATION.** The 16 provinces have an estimated area of 116,000 square miles. The population has been estimated at 1,272,000, or, including uncivilized Indians, 1,400,000. An estimate published in 1910, however, places the total at about 1,500,000. The Galápagos islands, constitute a territory; area, 2400 square miles; population, about 500. The inhabitants of Ecuador are almost all of Indian or mixed blood. The principal towns, with estimated populations, are: Quito, 80,000; Guayaquil, 75,000; Cuenca, 40,000; Riobamba, 18,000.

Public primary schools, instruction in which is free, number about 1200, with about 70,000 pupils in attendance. There are several institutions, especially in Quito for secondary, higher, and professional education. The established religion is Roman Catholicism.

**INDUSTRIES.** The people are occupied chiefly in agriculture. Valuable minerals exist, but have been little exploited. A few manufactories are established in Quito and Guayaquil. The plaiting of Panama hats is of considerable importance. The staple product is cacao, Ecuador being one of the principal sources of this article. Coffee, rice, and sugar-cane are cultivated.

**COMMERCE.** Imports and exports, in thousands of sucres, have been valued as follows:

	1906	1907	1908	1909
Imports .....	17,012	19,670	20,555	18,704
Exports .....	21,965	22,907	26,559	24,449

The leading imports are textiles, food-stuffs, iron manufactures, clothing, and wines and liquors. The decline in exports in 1909 is more apparent than real; for the total for the preceding year includes gold coin to the value of 2,800,508 sucres, while the total for 1909 includes less than 900,000 sucres. Import values in 1908 and 1909, expressed in American money, are \$10,277,365 and \$9,352,122; export, \$13,279,603 and \$12,439,400. The principal exports in the two years were:

Articles	1908	1909
Cacao .....	\$ 8,868,520	\$ 7,261,309

During 1909 foreign vessels entered at the port of Guayaquil numbered 195 steamers and 7 sailing vessels, with a registered tonnage of 398,963 and a cargo of 87,717 tons. Over half the shipping was British.

**COMMUNICATIONS.** The total length of railway in actual operation is about 325 miles, of which 286 miles are comprised in the line from Guayaquil to Quito, opened in June, 1908. In 1910 a line (begun in July, 1909) between Bahía de Caraquez and Quito (about 300 kilometres) was under construction. The government has contracted for a line from Vargas Torres to Ibarra (about 200 kilometres) and for one from Manta to Santa Ana. Telegraph system, 2608 miles, with over 60 offices. Quito is connected with Guayaquil and other towns by telephone.

**FINANCE.** The unit of value is the sucre, worth one-tenth of a sovereign, or 48.665 cents. Revenue and expenditure, in thousands of sucres:

	1906	1907	1908	1909
Revenue .....	12,188	12,725	13,362	15,878
Expenditure .....	13,237	15,402	12,765	15,566

About 70 per cent. of the revenue is derived from import and export duties. The largest item of expenditure is for the army. Total net debt, June 30, 1909, 43,142,393 sucres; on June 30, 1910, 44,000,000.

**ARMY.** While there are laws providing for compulsory military service these are not rigorously enforced and a standing army estimated at about 4350 officers and men is maintained. In time of war the National Guard could be increased up to about 90,000 men.

**NAVY.** There are one torpedo launch, one transport, and one lighter, with about 130 men.

**GOVERNMENT.** The executive authority is vested in a president, elected by direct vote for four years and assisted by a cabinet of five members. The Congress consists of the Senate (32 members) and House of Representatives (41, members). The president in 1910 was Gen. Eloy Alfaro, inaugurated Jan. 1, 1907.

In May, Ecuador in accepting the mediation of United States, Argentina, and Brazil in her boundary dispute with Peru imposed conditions which Peru was inclined to reject and troops in both countries were sent to the frontier, but at the request of the mediators the troops were withdrawn by June 4. On that day President Alfaro announced Ecuador's acceptance of the offer of mediation. Meanwhile Ecuador having refused arbitration under the King of Spain, the latter withheld his decision and later resigned the office of arbitrator. In August an outbreak of the bubonic plague was reported.

**EDDY, MARY (BAKER) GLOVER.** The founder and discoverer of Christian Science, died Dec. 3, 1910. She was born at Bow, N. H., in 1821.

MARY BAKER G. EDDY

३५०

Among her ancestors were persons distinguished in the early history of the United States. The first fifteen years of her life were passed on the farm on which she was born at Bow, but in 1836 her father sold the farm and she removed to Tilton, N. H. She attended school at Ipswich Seminary and other academic institutions, and also received instruction from her brother, who was a graduate of Dartmouth College. As to the amount of education which she received there is a dispute of authorities. It is asserted by some that she studied Latin, Greek, Hebrew and French and became proficient in these languages. It is claimed also that she became comparatively learned in logic and metaphysics. These statements have been disputed by investigators, who declared that she was not a good student and had but little education.

As a young girl she showed traces of an abnormal mentality, and she herself has detailed at some length curious psychological experiences which she underwent in her youth. Long before she became of age, she is said to have regarded herself as one set apart for some great work. Before she was sixteen years of age she had decided to fit herself either for the ministry or some other lifework in which she could make her abnormal mental powers felt.

In 1843 she married George Washington Glover and with him removed to Wilmington, S. C. Six months after the marriage Mr. Glover died of yellow fever and a few months later a son was born to his widow. She returned with the child to Tilton, N. H. Here she became deeply interested in the study of homœopathy and began a course at one of the colleges near her home. She did not pursue these studies long and on account of financial difficulties was obliged to place her child in the care of a nurse and go back to live at her former home. The child was left in ignorance that she was living and it was not until many years had passed that he discovered the fact.

Mrs. Glover was married again in 1849 to Dr. Daniel Patterson, a dentist. Mrs. Eddy has claimed that her chief object in marrying Dr. Patterson was to provide a home for herself and her child. She declared, however, that the child's stepfather was not willing that it should have a home with her. This marriage was unfortunate and a divorce was obtained in Salem, Mass. During the period of her marriage to Dr. Patterson, Mrs. Eddy began the foundation of what was later to be proclaimed the cult of Christian Science. The details of these experiences differ. Some of her biographers relate that she obtained possession of the life work of Phineas Parkhurst Quimby of Portland, Me., a believer in mental healing, rewrote many of his ideas and made of them a religion. This charge was denied by Mrs. Eddy and Christian Science leaders and several books in refutation of the accusation have been written at different times. It is a well known fact, however, that Mrs. Eddy prosecuted studies under Quimby in 1864. For several years after her studies with Quimby, Mrs. Eddy practised mental healing, but it was not until 1870 that she published her first volume, *Science of Man*, with a chapter on Science and Health. This was the forerunner of the book *Science and Health, with Key to the Scriptures*, which is the official text of the Christian Science Church. Previous to this time, however, in 1877, she married Asa Gilbert Eddy.

Dr. Eddy was the first man in the world to announce himself a Christian Scientist. He was also the organizer of the first Christian Science Sunday school, and in his later years attracted much attention by his lectures on Scriptural topics. He died in 1882.

Mrs. Eddy was successful as a healer, and the movement soon outgrew the city of Lynn, Mass., where she was at that time living and she removed to Boston. The Christian Science movement at once became popular in that city and its growth was remarkable. The official organ, the *Journal of Christian Science*, was established, with Mrs. Eddy as editor and chief contributor. This soon had a large circulation. Shortly after her arrival in Boston, Mrs. Eddy and her followers organized a Christian Science Association and it was decided to erect a church, called the First Church of Christ, Scientist. A charter was obtained in 1879 and Mrs. Eddy became pastor of the church. She was regularly ordained as minister in 1881. During the same year she founded the Massachusetts Metaphysical College in Boston, and this college flourished for eleven years, closing in 1892. Its graduates at that time numbered about 4000 and they carried on the work of Christian Science in all parts of the world. About this time Mrs. Eddy took up her residence in Concord, N. H., and went into semi-retirement. She continued, however, to have absolute authority in all matters relating to the Christian Science movement. Her home, called Pleasant View, became a place of pilgrimage for Christian Science believers.

In 1906 reports were circulated that Mrs. Eddy was dying. These reports were denied and Mrs. Eddy issued a statement declaring them false. They continued, however, and in March, 1907, a bill in equity to obtain an accounting of her financial affairs was filed by her son, George W. Glover, who alleged that his mother's property was in the control of persons who unduly influenced her. Mrs. Eddy was at this time reputed to be worth a large sum of money. The suit resulted in a compromise by which a fund of \$400,000 was set apart by Mrs. Eddy for her son and other relations. During this litigation, Mrs. Eddy removed her household from Concord to Newton, Massachusetts. Scarcely had this suit been settled when trouble arose over the alleged attempt on the part of Mrs. Augusta E. Stetson, leader of the First Church of Christ, Scientist, in New York City, to usurp the power of Mrs. Eddy and proclaim herself Mrs. Eddy's successor in the leadership of Christian Science. Mrs. Stetson denied these accusations, together with the additional charge that her teachings were contrary to the principles of Christian Science as taught by Mrs. Eddy. A hearing was held by the Board of Directors of the Mother Church, and as a result Mrs. Stetson was excommunicated, and sixteen of her followers were expelled from the First Church in New York City.

Mrs. Eddy's death came after many false reports of her decease had been circulated.

Whatever her mental and intellectual attributes may have been, it is an undisputed fact that Mrs. Eddy had a strong personality, a remarkable talent for organization, and firmness of purpose. Her authority was never questioned by her followers and she carried on the affairs of the denomination with absolute power and

almost without criticism until the time of her death.

She was a prolific writer. In addition to *Science and Health with Key to the Scriptures*, which has been revised many times, she wrote *Retrospection and Introspection*, *The Unity of God*, *Miscellaneous Writings*, *Rudimental Divine Science*, *Messages to Mother Church*, and *Christian Science Versus Pantheism*. She also contributed to the Christian Science periodicals. See CHRISTIAN SCIENTISTS.

**EDINBURGH, WORLD MISSIONARY CONFERENCE.** See MISSIONS, PROTESTANT, FOREIGN.

**EDMANDS, J. RAYNER.** An American astronomer, died March 26, 1910. He was born in 1850 and graduated from the Massachusetts Institute of Technology. He was for more than twenty-five years associated with the observatory staff of Harvard University and he made notable researches as an astronomer. In addition to his scientific work he will be remembered as having laid out paths in the mountains of New Hampshire. A short time previous to his death he completed a path from the base to the summit of Mount Washington.

**EDUCATION.** See below, **EDUCATION IN THE UNITED STATES**; also **UNIVERSITIES AND COLLEGES**, and the paragraphs on the subject in articles on countries and in States of the United States.

**EDUCATIONAL ASSOCIATION, NATIONAL.** See **EDUCATION IN THE UNITED STATES.**

**EDUCATION IN THE UNITED STATES. THE COMMISSIONER'S REPORT.** The first volume of the report of the United States Commissioner of Education for the year ending June 30, 1910, appeared late in December. The work of the bureau's newly appointed specialists in school administration and in land-grant college statistics had met with success, and the bureau's enlarged quarters and increased staff had amply justified themselves. In the field of state education it recorded that California had begun at Fresno to give two years of post-graduate or college work in its high school, South Dakota and Montana had placed all state educational institutions under a single board of control, Virginia had established a State Board of Regents, Iowa a State Board of Education, and Mississippi a State Educational Board of Trustees. Organizations like the Association of American Agricultural Colleges and Experiment Stations, had done much to encourage movable and summer schools, farmers' institutions, travelling specialists, and correspondence courses for teachers—all in the interest of rural schools, as well as of agriculture.

A fourth conference of State superintendents of public instruction was held with representatives of the bureau. There was also a conference of representatives of eight States of the Middle West, and the superintendents of thirteen Southern States visited Iowa, Minnesota, and Wisconsin under the auspices of the Southern Education Board.

Important legislation was recorded for New York concerning rural schools, for Virginia in general supervision, for Massachusetts, Ohio and Virginia concerning child labor, and for New Jersey concerning juvenile delinquents. Virginia established an agricultural board. New York provided for the pensioning of teachers in State institutions. Massachusetts is recasting her entire state educational system. The bureau,

the Census Office, the National Education Association's committee on uniform statistics, and the National Association of School Accounting Officers are coöperating for the better reporting of all school statistics.

In various city school systems there were interesting special activities, like open-air schools, the extension of medical inspection, the advance of the trade-school idea, the combination of schooling and apprenticeship, arrangements for finding employment for school graduates, and the increase of attention paid to backward and otherwise exceptional children.

Reports on industrial education were issued by the American Federation of Labor, National Association of Manufacturers, National Society for the Promotion of Industrial Education, State of New York, and Bureau of Education. Libraries and museums, playgrounds, home-and-school associations, evening and other continuation schools, lectures, correspondence courses, and home study, all showed in the year some new adjustment to the regular work of the schools.

The commissioner, in conclusion, called attention to the need for a more stable and a better trained body of teachers, for less ornamental and more sanitary school buildings, for better attendance in the higher elementary grades, and for still better supervision of country and rural schools.

**STATISTICS.** Preliminary statistics from the report of the commissioner, announced for March 1911, gave a public school enrollment in 1910 of about 17,200,000 pupils, or 19.6 per cent. of the population. In addition, private schools enrolled 1,500,000 and universities, colleges and professional schools 300,000,—the grand total of 19,000,000 representing 21 per cent. of the population. The public schools spent about \$380,000,000, or \$31 per pupil in average attendance, or \$4.27 per capita of the population. The average attendance was 71 per cent. of the enrollment, and of this 92 per cent. was in elementary and 87 per cent. in secondary schools.

The report of the commissioner appearing in March, 1910, owing to the slow process of collecting statistics through State and county superintendents, presents complete statistics of State school systems for 1907-8, along with those of city school systems for 1908-9. The grand total enrollment in the common schools for 1907-8 was 17,061,962 pupils, or 19.64 per cent. of the total population. The total included 8,573,825 boys and 8,448,173 girls, 4,935,986 pupils in 669 cities of 8000 population and over, and 737,907 in 679 towns of 4000 to 8000 population. In all there were 770,456 students in public high schools. There were 1,319,409 pupils in private schools in cities and towns, and 227,652 elsewhere. The 5,673,893 pupils in public schools in towns and cities, constituting 33 per cent. of the total enrollment, had an average term of 188 days an average daily attendance of 77 per cent. of the enrollment. They were cared for by 134,265 teachers—11,750 men, 122,514 women—at a cost of \$183,170,820, or \$41.85 per pupil in average attendance, or 22 cents per pupil per day. The 11,388,069 pupils in public schools outside of towns and cities, 66 per cent. of the total, had an average term of 134 days, and an average attendance of 68 per cent. of the enrollment. They were cared

for by 361,198 teachers—92,745 men and 268,453 women—at a cost of \$188,173,590, or \$24.19 per pupil in average attendance, or 18 cents per pupil per day.

**ATTENDANCE.** Of the attendance of 3,745,591 in 1907-8 in places of 4000 population and over, 19 per cent. was in first grade classes, 19 per cent. in second grade, 14 in third, 13 in fourth, Of the high school attendance of 420,000 in the same places in 1908-9, 42 per cent. were in the first year, 26 in the second, 17 in the third, and 12 in fifth, 10 in sixth, 8 in seventh, 5 in eighth, 12 in the fourth. Evening schools in 233 places of 8000 and over enrollment in 1908, 379,052 pupils who averaged an attendance of 41 per cent.

**TEACHERS.** Of the teachers, 21 per cent. were men as compared with 42 per cent. in 1880, 34 per cent. in 1890 and 29 per cent. in 1900. The average monthly salary was \$53.88, the average for men being \$62.35, for women \$51.61, a marked increase since 1900. The public schools in 1907-8 used 282,170 buildings and property valued at \$945,395,162, expending a revenue for school purposes of \$381,919,526 or \$4.37 per capita of population as compared with \$2.84 in 1900, \$2.24 in 1890, and \$1.56 in 1880. This expenditure was divided into \$73,640,408 for equipment, \$77,923, 879 for maintenance, and \$219,780,123 for salaries. The expenditure for public schools represented in 1904 25 cents for each \$100 of the total wealth of the country, as compared with 24 cents in 1900, 31 in 1890 and 17 in 1880. Permanent funds for the benefit of public education amounted in 1908 to \$246,943,349, the States having more than ten million being Texas, \$61,526,243, Illinois \$20,275,835, Minnesota \$19,709,383, North Dakota \$14,000,000, Missouri \$13,754,150, and Indiana \$11,002,363.

**SPECIAL SCHOOLS.** There were in 1908-9, 273 normal schools with 3660 instructors, 82,288 students, and 14,165 graduates. Of these the 193 public normal schools had 3150 instructors, 73,370 students, and 12,659 graduates. There were also 9822 students in training courses for teachers in 733 public high schools, and 4,105 in 195 private high schools and academies. The 7809 such students in universities and colleges brought the total number of students in training courses for teachers to 103,824.

More than half of the 1348 places of 4000 inhabitants and over now provide manual training in the schools. Only 37 did so in 1890. In 265 public high schools there were 25,665 students in manual training. In 310 specifically manual, industrial and technical schools there were 71,090 high school and 43,555 elementary pupils. These 310 schools include 60 for Indians.

There were in 1908-9 574 commercial and business schools with 3300 instructors and 146,288 students, 72,255 business and commercial students in 1431 public high schools, 7194 in 386 private schools and academies, 5405 in 66 universities and colleges, and 1350 in 39 normal schools.

In the 16 former slave States and the District of Columbia there were 1,665,781 negroes in the schools in 1907-8 as compared with 1,560,070 in 1899-1900 and 1,296,959 in 1889-1890. There were in 1908-9 135 schools especially for negroes with 2417 teachers and 44,073 pupils, 23,160 receiving industrial training.

Reformatories gave instruction to 39,877 inmates, of whom 36,262 were in vocational classes.

There were also 105 reform schools with 51,871 inmates.

For the blind there were in 1908-09 41 State schools with 534 teachers and 4413 pupils, for the deaf, 57 public and 70 other institutions with 12,771 pupils. There were 26 State and 17 private institutions for the feeble-minded, with 11,103 inmates receiving instruction.

There were in 1908-09, 3738 pupils enrolled in 78 schools in Alaska, an increase of 44 per cent. over 1907-08.

**ASSOCIATIONS.** The National Education Association meeting in Boston in July, declared: its endorsement of the National Bureau of Education, and of an increased appropriation for its support; its appointment of the United States commissioner of education, the president and all living ex-presidents of the National Association, and seven others to formulate plans for an international council of education; its commendation of the growing interest in the moral development of children; its belief in the old courses of study giving culture and transmitting the ideas and ideals of the past, along with its endorsement of the movement to make courses of study more democratic, commercial and industrial, with more liberal appropriations for work in agriculture, in the trades and industries, and in home economics; its belief in all efforts to make educational plants more sanitary and to impress the importance of the proper observance of the laws of health; its endorsement of legislation against the employment of children in industrial occupations that limit their educational opportunities; its endorsement of higher salaries, broader culture, more thorough training, and loftier ideals for teachers; its sense of the duty of all teachers to advance the movement for the world's peace; and its opposition to any division of the public school funds among private or sectarian schools.

At the Education section of the American Association for the Advancement of Science, meeting in Boston during the Christmas recess of 1909-10, Professor Mead of the University of Chicago held that "The Psychology of Social Consciousness" should be more fully considered in teaching. Professor Dearborn of Chicago presented tests for measuring progress in learning to read and of the success of methods of instruction, and Professor Ruediger of George Washington University presented similar tests for merit in teachers.

**THE SOUTH.** The thirteenth annual Conference for Education in the South, meeting in Little Rock, Ark., in April, reported that since 1900 current expenditure for public education in the Southern States had increased 150 per cent., the value of school property 200 per cent., the expenditure for the training of teachers 200 per cent., high school facilities in cities and towns 100 per cent., in villages and rural districts 400 per cent., the average length of the school year from 20 to 25 per cent., the average increase of teachers' salaries from 50 to 100 per cent. The General Education Board, besides granting about \$1,500,000 for higher education in the South, had been instrumental in establishing about 1000 high schools, chiefly through maintaining special high school representatives in the State universities. It had also aided agricultural demonstration work and rural schools, through the United States Department of Agriculture. In May, the board appropriated \$31,450 for such professors of secondary education

and \$113,000 for the agricultural work mentioned. In January the Peabody Education fund allotted \$1,000,000 to the Peabody Normal College, at Nashville, Tenn.

**CITY SYSTEMS.** In the schools of New York City, naturally the leaders in many matters, 698,933 pupils enrolled in September, an increase of 18,065 over 1909. Of these 53,816 were on part time, an increase of 863. One high school enrolled 1407 new pupils. The Permanent Census Board of the Department of Education found 1236 children living in one block. In January Dr. W. H. Maxwell was re-elected superintendent for a third term of six years. His twelfth annual report, appearing in December, recommended provision in all schools for serving lunches to pupils, a department for training teachers of atypical children, the continuance of sewing through the seventh and eighth grades and of cooking into the sixth as well as the last two years, a bureau of hygiene to examine pupils for physical defects and to take steps to remedy them; the establishment of summer schools, summer evening schools for teaching English to foreigners, several day truant schools, savings banks in every school, a small fee for evening schools, a corps of special teachers to assist regular teachers whose classes contained over 50 pupils, and, finally, the reorganization of salaries along civil service lines, with promotions and payments according to merit, without sex distinction. Of the 127 teachers retired in New York during the year ending February 1, more than one third were suffering from general nervous breakdown. In October a commission recommended salary increases of \$1,700,377 a year, 93 per cent. for women teachers and 7 per cent. for men.

In Chicago high schools the enrollment of girls increased 589, while that of boys decreased 22. Beginning with May all principals and all high school instructors in Chicago were required to have college degrees. In January \$240,000 a year was added to teachers' salaries, chiefly on the basis of service.

Pittsburg received from Mr. Carnegie a fund yielding about \$12,000 a year for the benefit of teachers. Much of this was expended in paying all the expenses of many teachers of summer schools.

Boston increased its pensions for teachers from about one-fifth to one-third of the salary on retirement at 65.

In Baltimore the refusal of the City Council to confirm two members of the school board of nine approved by the mayor, gave rise to charges of interference on the part of political interests and of school-book publishers.

The superintendent of schools in Springfield, Mass., found present day pupils far superior to those of 40 years ago, when tested by a set of examination questions and answers of that date. The same superiority was found, by means of the Springfield questions, in other cities.

**MORAL AND RELIGIOUS EDUCATION.** The Moral Education Board, with headquarters in Baltimore, prepared for schools a course of stereopticon illustrations of moral lessons from actual happenings. The Character Development League of New York prepared 100,000 booklets on "Traits of a Perfect Character" for the schools of New York and New Jersey. The Religious Education Association, meeting in

Nashville in March, discussed "The Church and Educational Forces," "The Public School and the Church," "Progress in Religious and Moral Education," "The Moral Atmosphere of the High School," and "Public School Teachers and Moral Education."

**SPECIAL SUBJECTS:** the CLASSICS, SCIENCE, ART. In special subjects the instruction in classics was influenced by the report of the American Philological Association in favor of the translation of unseen passages as a test of knowledge. There were efforts toward a better correlation between secondary school and college instruction in chemistry, and many discussions of the teaching of elementary and secondary school physics and of the general relations of that subject to education. The Public Education Association of New York emphasized indirect instruction in the arts through good pictures and other decorative agents in school buildings.

**SCHOOL AND COLLEGE ADJUSTMENT.** Although on the part of college authorities there was a growing tendency to cooperate with fraternities, public school authorities continued in some places to restrict, in others to abolish school secret societies. Colleges and secondary schools continued to widen their differences of opinion concerning the requirements for college entrance until some comprehensive discussion and agreement on the question seems imminent. That much adjustment is still necessary was shown by the North Central Association of Colleges and Secondary Schools dropping many high schools in Illinois, Indiana, Iowa, Minnesota, Michigan and Ohio from its accredited lists; and, in the East, of the Rector of St. Paul's, on the one hand, advocating that the secondary schools take over all collegiate instruction, and, on the other hand, Harvard's showing that of 178 first and second group scholars only seven came from such schools as St. Paul's.

**SPECIAL ACTIVITIES.** These are industrial, military and nautical education; international relations and schools for immigrants; physical education, hygiene, and play-grounds; vacation schools, provision for exceptional children, adults and negroes. The fourth annual convention of the National Society for the Promotion of Industrial Education, meeting in Boston in November, made a good beginning toward some practical adjustment between the schools and conditions in the fields of manufacture, commerce and labor. Military interests in the schools were encouraged by the action enabling the Secretary of War to aid school target practice. New York City continued to conduct the only free nautical school.

International relations were encouraged by French official encouragement of the teaching of that language in American schools and a German plan for an international exchange of pupils. The special school needs of immigrants continued to receive attention.

The Russell Sage Foundation reported that of 2392 high schools investigated, only 469 had athletic fields, 175 gymnasiums, and 139 a medical examination of students. Only 372 gave instruction in hygiene and 255 presented it; 188 gave instruction in gymnastics and 114 presented it; 232 gave instruction in athletics, and 28 presented it. In all of these matters the colleges do far better. The Playground Association reported 1535 public playgrounds maintained in 267 cities at a cost of \$1,353,114 an-

nually. Of 323,000 children examined in New York 183,000 had defective teeth, 73,000 nasal and 38,000 eye troubles. A Boston philanthropist in March established a \$2,000,000 endowment for the free dental care of all children under 16. Boston also experimented with school lunches. The movement for open-air schools met with extension and success.

New vacation schools were established in various cities, and school dramatics continued to prosper, although with some discouragements. The various movements for the special care of precocious, backward or otherwise exceptional children progressed steadily. More than 100 cities have now free lectures in school buildings for adults, following the example of New York City where the aggregate weekly attendance on such lectures reached 959,982.

Negro education was reported to have decreased the illiteracy of the race from 83 to 43 per cent. in ten years. Indian education and education in the Philippines continued under the disadvantage, in the eyes of educational experts, of being administered by the Bureau of the Interior and the War Department.

**PERSONAL.** The election of Mrs. Ella Flagg Young as president of the National Education Association and her re-election as superintendent of schools in Chicago encouraged women teachers all over the country and also encouraged the election of more women to lower school boards. Dr. Wm. J. Rolfe, author of many well-known school text books, and Charles Sprague Smith, director of the Peoples' Institute in New York City, died during the year.

**BIBLIOGRAPHY.** Among the important educational books of the year were: *How We Think* by John Dewey, *Habit-formation and the science of education* by Stuart H. Rowe, *Government by influence* by Elmer E. Brown, *Principles of education* by E. N. Henderson, *Changing conceptions of education* by E. P. Cubberly, *Vocational education* by John M. Gillette, *Horace Mann* by George A. Hubbell, *The American Rural School* by H. W. Foght, *Problems of the elementary school* by Arthur C. Perry, *High School administration* by Horace A. **EDWARD VII.** King of the United Kingdom of Great Britain and Ireland and of the Dominions Beyond the Seas, Emperor of India, died May 6, 1910. King Edward was born on November 9, 1841, the second child and oldest son of Queen Victoria and the Prince Consort, Albert. He was christened Albert Edward. On January 22, 1901, he succeeded his mother, Queen Victoria.

He received careful training as a boy from his father and his mother, and at the hands of private tutors. At the age of eighteen he spent several months in Edinburgh University where he studied chemistry under Lord Playfair, Roman history under Dr. Schmitz, and Italian, French and German under other teachers. In the meantime he exercised with the Sixteenth Hussars. After completing his studies in Edinburgh he went to Oxford and was entered as an undergraduate in Christ Church College. Here

he spent one year attending the lectures of the most distinguished teachers, among whom were Professor Max Müller and Professor Goldwin Smith. He also was in Cambridge for four terms. His early education, however, was not confined to study, but included travel and visits to foreign lands. In the celebrated visit paid by the Queen and Prince Albert to the Emperor Napoleon in August, 1855, Prince Edward and his sister accompanied their parents. At fourteen years of age, after a walking tour in the west of England, he went to Germany. A tour of Ireland followed in 1858 and in the following year, when he was already legally of age, he started on a Continental tour, travelling *incognito* as Lord Renfrew. More important than these journeys, however, were visits to Canada and the United States and a tour in the Holy Land and Egypt.

In 1860, in fulfillment of a promise made several years before, he went to Canada for the special object of opening the great railway bridge across the St. Lawrence at Montreal, and laying the foundation stone for the building at Ottawa in which it was intended that the future Canadian Parliament should meet. No sooner was it known that the Prince was to visit Canada than a cordial invitation was sent by President Buchanan that he should extend his visit to the United States. This invitation was accepted, as was also one from the municipality of New York City. It was at the same time made plain that from the time of leaving British soil the Prince would drop all royal state, and travel as Lord Renfrew. From the time of the Prince's landing at St. John's, Newfoundland, the tour was an unqualified success. Everywhere the young Prince's tact, good sense and pleasant manners, made a most favorable impression. At Washington the Prince stayed at the White House, and he attended receptions at Detroit, Chicago, New York and other cities. He was everywhere in the United States received with the greatest enthusiasm.

Before the intended tour to the Holy Land could be made, occurred the death of the Prince Consort, on December 14, 1861. This event changed the entire course of Prince Edward's life. Queen Victoria withdrew almost entirely from public life and thus threw upon the Prince of Wales, as he had now become, a multitude of new responsibilities. He was only twenty years of age and yet his father's death placed him of necessity at the head of English society, and made it certain that in a few years the whole of what may be called the social and ornamental duties of the Crown, as distinguished from the political, would fall primarily upon him. It was decided that a portion of the year of mourning should be passed by the Prince at a distance from England, and the opportunity was taken of carrying out the visit to the Near East, which the Prince Consort had wished his son to undertake. In this tour Prince Edward had the companionship of Dr. Arthur P. Stanley, at that time Regius Professor of Ecclesiastical History at Oxford and afterwards Dean of Westminster. The party visited Jerusalem where for the first time in nearly seven centuries the Mosque of Hebron was opened to allow the visit of Christians.

In the meantime the question of the marriage of the Prince was receiving earnest attention, and in September, 1862, it was officially an-

nounced that he was engaged to be married to the Princess Alexandra of Denmark, the daughter of Christian IX. whom he had visited the previous year. They were married on March 10, 1863. On February 5 of the same year, Prince Edward had taken his oath as the Prince of Wales, and his seat in the House of Lords. Upon the Prince and Princess of Wales now devolved the duty of representing the Queen at all public and semi-public functions, and during the forty years that elapsed between the death of his father and his own accession to the throne the Prince performed these duties with unflinching tact and good humor.

In 1868 the Prince and Princess paid a state visit to Ireland, where the Prince unveiled a statue of Edmund Burke, and on their way home stayed for some time in Wales. In November of the same year, they made a long tour of the Continent and after spending several weeks in France, Denmark, Germany and Austria, they passed on to Egypt, remaining some weeks on the Nile. They then went to Constantinople and visited the Crimea and Sebastopol. In November, 1870, the Prince became dangerously ill from typhoid fever and recovered only after the greatest universal anxiety. In 1875 the Prince made a tour of India where he was warmly received by the native rulers. During the years that followed the Prince devoted himself chiefly to his official duties and to the pleasures of social life. In 1887 came the first jubilee of the Queen in which he played an important part. In 1891 occurred the celebrated baccarat case, in which the Prince was obliged to give evidence in a lawsuit. There was at this time much criticism of his actions in playing games of chance in houses to which he was invited. In the same year the Prince George became ill from typhoid fever, and no sooner had he recovered than his elder brother, Prince Albert Victor, the Duke of Clarence and heir-apparent, was attacked by influenza in its severest form. This Prince had just become engaged to Princess Victoria Mary of Teck. In less than a week from his first seizure he died, and Prince George then became heir-apparent.

The remaining years up to his accession were without particular incident in the life of the Prince. The funeral of the Queen took place on February 2, 1901, and the King's first public appearance was at the opening of Parliament in the same month. This was accompanied by a pageantry which, at that time, was an innovation, but to which the people became accustomed during the life of the King. He passed the first year of his reign more or less in retirement and was busily occupied, both in public work and such semi-private affairs as the reorganization of the Palace and the resettling of the resources of the Crown. He had as Prime Minister, Lord Salisbury, who rendered most loyal service.

The coronation of King Edward was set for June 26, 1902, and for months preparations had been made to make it the most splendid and moving spectacle that had been seen in England for generations. On the morning before the day fixed, rumors were circulated of the illness of the King, and soon these became a certainty. He was suffering from perityphilitis and it was found necessary to remove a large internal abscess. Although then in his 60th year the King survived the ordeal, showing remarkable vitality,

and his recovery was so rapid that the coronation could take place on August 9.

King Edward ascended the throne holding the esteem and affection of his subjects to a greater degree than has probably been the lot of any previous English sovereign, and this he retained to the time of his death. He showed a deep interest in the welfare of Ireland and visited that country in 1903 and 1904. He was enthusiastically received, and held court at Dublin Castle. During his reign King Edward visited almost all of the countries of Europe more than once and welcomed their sovereigns and representatives to England as his guests. The influence on the establishment of good relations between countries which he exercised in this way was extraordinary. In 1903 he made visits to Portugal, France and Austria and in 1904 he made a visit to the German Emperor at Kiel, which was the subject of much speculation throughout Europe. In 1906 also he paid visits to the Continent. He was accustomed to spend a portion of each year in the south of France at Biarritz. In 1908 he visited President Fallières of France and in the same year went to Denmark and other places in Scandinavia. In the same year he went to Reval where a meeting with the Czar took place. These visits were returned by the sovereigns of these countries and illustrated the great cordiality of feeling between England and other Continental nations. These visits were often politically important events and were made to some extent with definite political purposes. King Edward's influence, both from his personality and from his relationship with most of the sovereigns of Europe, by marriage or otherwise, made him a potent factor in the politics of Continental Europe and won him the title of "Edward the Peacemaker." The King also took the keenest interest in the politics of England, and here as in foreign affairs he had the grasp of the practical statesman without being exposed to the disturbing influences of personal and party interests.

It is in the domain of foreign affairs that his influence was most widely felt, and it is due to him that Great Britain's relations with France, Germany, Russia, and Austria were, officially at least, uniformly friendly and cordial during his reign. His popularity in the United States counted for much in the friendly relation between the two countries which existed throughout his reign.

The King took keen delight in the pleasures of life and was an ardent sportsman. He hunted big game in India and was a lover of fishing. He was the most prominent figure in the racing field. He maintained a stud of horses and several times horses wearing his colors won the Derby and other great races. He was also interested in agriculture and was one of the largest breeders and exhibitors of live stock in England. Privately he lived the life of a country gentleman and his chief pleasure was in improving his estates and rearing fine stock.

He took great interest in charitable and philanthropic work and he founded and supported a hospital of his own. Institutions like the Salvation Army and the Church Army had his personal encouragement. He instituted the Edward Medal, which with the Albert Medal has been called the Victoria Cross of Civil Life. It was awarded for deeds of heroism by civilians.

EDWARD VII.

1900

He also founded the Order of Merit for distinction in war, science, art, literature and the service of man.

The King's personality was a most attractive one. He was approachable, genial and sympathetic. At the same time he had an abundance of royal dignity and would not tolerate any encroachment on what he considered the respect due his position. His devotion to the routine work which devolved upon him was extraordinary, and even during his last illness it was impossible to prevent his devoting his strength to matters which came up for his consideration.

The King had for some years suffered from emphysema, with an attendant bronchial catarrh. This caused digestive disturbances and other symptoms which gave grave concern to his physicians. On April 7, 1910, he went to Biarritz for a brief rest. He returned on April 27th apparently better and at once took up the thread of his very full life. On April 30 during a visit to Sandringham he apparently contracted a cold. This continued and on May 4 he complained of an irritation in the throat. The conditions revealed to the physicians on examination called for a consultation, and it was found that there was an irritable and catarrhal condition in his throat and other organs. In the meantime, however, the King continued to give important audiences. His condition did not improve and on May 5 he had several severe attacks of dyspnoea and the physicians at once saw that the gravity of the symptoms had increased. He had other attacks of a more dangerous character and on the afternoon of May 6 consciousness began to fail, and death came at 11:45 P. M. of that day. See GREAT BRITAIN.

**EDWARDS, D. M.** See LITERATURE, ENGLISH AND AMERICAN, *Travel and Description*.

**EGG.** See ZOOLOGY.

**EGGLESTON, G. C.** See LITERATURE, ENGLISH AND AMERICAN, *Biography*.

**EGGS.** See AGRICULTURE.

**EGYPT.** A country of northwestern Africa, nominally under the suzerainty of Turkey but practically under the protection of Great Britain. Capital, Cairo.

**AREA AND POPULATION.** Total area, exclusive of the Egyptian Sudan, about 400,000 square miles; of which only 12,976 square miles (the Nile valley and delta) are settled and under cultivation. Total population (1907), 11,287,359 (nomadic Bedouin tribes estimated at 97,381 additional). Of the censused population 10,386,046 were Egyptians, 69,725 Turks, 62,973 Greeks, 34,926 Italians, 20,653 British and Maltese, 14,591 French and Tunisians, 65,162 Sudanese. Engaged in agriculture, 2,315,149; in domestic service, 2,358,506; in manufactures 376,341; in trade, 161,210; in unknown and unproductive occupations, 5,378,076. Cairo had (1907) 654,476 inhabitants; Alexandria, 332,246; Tantah, 54,437; Port Said, 49,884; Mehalla and Kobra, 47,955; Mansurah, 40,279; Assiut, 39,442; Damanhour, 38,752; Fayum, 37,320; Zagazig, 34,999; Damietta, 29,354.

**EDUCATION, ETC.** The oldest known schools are the indigenous "kuttab," which the government has been gradually bringing under departmental supervision by means of awards for efficiency. In 1909 there were 3581 of these kuttab under inspection; with 190,875 pupils (16,852 girls), receiving total grant-in-aid of ££21,479. Total government expenditure on

elementary vernacular education, ££70,577 in 1908. Total schools other than kuttab in 1907-8, 735, with 113,430 pupils (25,134 females); of whom 91,844 were Egyptians, 7929 Greeks, 6379 Italians. According to their religion the pupils were: Mohammedans, 54,186; Christians 51,869 (Copts 28,961); Jews, 7149; others, 226. There are secondary, special, and industrial schools, and 11 professional colleges. Total expenditure of the Ministry of Education 1908, ££450,450 (estimate).

There were in 1907 10,366,826 Mohammedans; 706,322 Copts; 38,635 Jews; 57,744 Roman Catholics; 76,953 Greek Orthodox; 27,937 Eastern Christians. The Mosque and University of El Azhar at Cairo had (1908) 329 professors and 9940 students; the Mosque of El Ahmadi at Tantah, 69 and 3607.

**COMMERCE.** The commerce for three years is given in pounds Egyptian (1 pound Egyptian = \$4.943):

	1907	1908	1909
Imports, mdse.....	26,120,783	25,100,397	22,230,499

\* Less than ££1,000.

**SHIPPING.** Vessels entered (1909), 2035, of 3,431,781 tons (707, of 1,347,581 tons, British); cleared, 2040, of 3,433,972 tons (705, of 1,340,566 tons, British). Number of vessels

of all kinds passing through the Suez Canal in 1909, 4239, of 21,500,847 gross tons (2561, of 13,242,016 tons, British). Receipts of the company in 1908, £4,340,235; in 1909, £4,825,707.

**PRODUCTION.** Of the total population, 61 per cent. (the fellahen) are dependent upon agriculture. Area under cultivation (1908), 6,448,000 feddans (1 feddan=1.038 acres). Under wheat, 1,168,166 feddans; corn, 1,977,705; cotton, 1,640,415; sugar cane, 38,562; rice, 248,763; beans, 541,085; barley, 440,606. Cotton crop (1908), 7,234,669 cantars (1 cantar=44.9 kilograms). The entire cotton area depends upon irrigation, as there is practically no rainfall during the summer. Near the Nile the water level of the canals is higher than the adjacent land levels, and getting the water from the canals to the fields is a simple matter; nearer the desert borders it is much below that of the fields, and water wheels, operated by camels or horses, are used to bring the water up to the land level. Three crops a year are produced: cereals, sown in November, harvested in May or June; cotton, sugar, and rice, sown in March, harvested in October or November; rice, corn, millet, and vegetables, sown in July, harvested in September or October. A large part of Assiut and Beni Suef has now perennial irrigation. The level of the Assuan dam is to be raised by 6 metres, doubling its capacity; a new barrage has been constructed at Esna. Though the *corvées* has been abolished, the people are called out in emergencies, such as the breaking of the Nile banks in flood time. In 1907, 16,898 men were called out.

About 1,000,000 tons of salt are produced annually, and turquoises are obtained in the Sinai Peninsula.

**COMMUNICATIONS.** Length of State railways 1464 miles Dec. 31, 1908. Dec. 31, 1909, 1465 miles (exclusive of the Sudan military railway to Khartum); agricultural light railways, privately owned, about 780. Working expenses in 1908 (State railways), £E2,082,231; gross receipts, £E3,435,451. Length of telegraph lines (1909), 2893 miles; wires, 12,952; telephone wires, 2088; telegraph offices, 328; post-offices, 1574.

**FINANCE.** The unit of value is the Egyptian pound, worth \$4.943. Revenue and expenditure for three years are given in pounds Egyptian:

	1907	1908	1909
Revenue ....	16,367,818	15,521,775	15,887,313
Expenditure.	14,286,413	14,408,144	16,226,841

The estimated revenue for the year 1910 reached £E15,350,000 (direct taxes, £E5,565,090; other taxes and dues, £E5,083,000; receipts from revenue-earning administrations, £E3,725,000); expenditure, £E15,150,000 (costs of administration, £E4,898,426; tribute and debt, £E4,595,594; expenses of revenue-earning administrations, £E2,492,306; defense £E867,006; pensions, £E540,000; Sudan deficit, £E325,000; civil list, £E281,803. Public debt, May, 1910, £95,195,140 (sterling).

**GOVERNMENT.** The khedive (Abbas Hilmi, since January, 1892), is the head of the government. In him and his ministers is also vested the final legislative power, the legislative council and the legislative assembly (46 of whose members are elective) being but consultative bodies. The practical administrative head of

the government is the British agent, consul-general, and minister plenipotentiary (since 1907 Sir Eldon Gorst); and no financial measures can be taken without the concurrence of the British financial adviser (1910, H. P. Harvey).

**ARMY.** The Egyptian army on a peace basis is made up of about 19,000 officers and men, although there are always on the rolls for conscription about 150,000 young men, for by law all male inhabitants are liable for military service, six years in the army, five years in the police, and four years in the reserves. As a result the troops are carefully selected and a number (188 in 1910) of British officers are attached to the Egyptian army, which is commanded by a British officer, Lieut.-Gen. Sir Reginald Wingate, who bears the title of Sirdar and Governor-General of the Sudan. The artillery in particular exhibit the effect of the training of the European officers and are well equipped. A horse battery has Krupp light guns and is drawn by Syrian horses, while the field batteries are packed by mules with a second line of camels. The cavalry is made up from the fellahen of the Delta. In 1910 the army was reported as made up of 18,273, including 789 cavalry, 619 in camel corps, Arab battalions 206, artillery 1258 and 10,280 infantry. In addition to this native force there is a British army maintained in Egypt and this in 1910 consisted of 6265 men, comprising 1 cavalry regiment, 1 horse battery, 1 garrison company, 1 company royal engineers, 4 infantry battalions, the third battalion of the Coldstream Guards and other details. As in 1909 Gen. Sir J. G. Maxwell was in command. For the maintenance of this force the Egyptian government contributed £150,000.

#### HISTORY.

**POLITICAL UNREST.** The Nationalist agitation, which has been the chief feature of Egyptian history in the last few years, continued during 1910. It was marked early in the year by an atrocious crime, the killing of the Egyptian Premier, Boutros Pasha, who was shot by a student on February 20. The murderer was a Cairo chemist, named Ibrahim Wardani, who had been Secretary of the Young Egypt Geneva Congress in 1909 and was a correspondent for a native paper. He appeared to have no personal grudge against the victim, but to be actuated merely by hostility to the British supremacy. Sir Eldon Gorst, commenting on the crime, declared that he had no hesitation in saying that the leaders of the Nationalist party were morally responsible for the murder. He said that the murderer in defense of his deed had merely reiterated the accusations against Boutros which had appeared in the columns of the Nationalist press. By a strange irony, he added, the blow had fallen upon the first genuine Egyptian who had risen to the highest position in his country. Lord Cromer pronounced Boutros Pasha the ablest of the Egyptian ministers and a man thoroughly devoted to his country's true interests. The press generally, including even the Nationalist papers, united in denouncing the crime. The murderer was condemned to death on May 13, and hanged on June 28. Mohammed Said Bey became Premier of the new Cabinet. Mr. Theodore Roosevelt, who arrived at Cairo in March when public attention was concentrated on this crime, became much interested in Egyptian affairs and

upon his visit to London delivered a speech (May 31) on England's position in Egypt, which caused widespread comment. After saying that England had given Egypt the best government that it had ever had, recent events, and especially the assassination of Boutros, showed that it had made the mistake of attempting to do too much in the interests of the Egyptians themselves. He declared that in such a situation organized timidity and sentimentality might cause more damage than even violence and injustice. "Either you have the right to be in Egypt or you have not; either it is or it is not your duty to establish and keep order. If you feel you have not the right to be in Egypt, if you do not wish to establish and keep order there, why, then by all means get out of Egypt. If, as I hope, you feel that your duty to civilized mankind and your fealty to your own great traditions alike bid you to stay, then make the fact and the name agree and show that you are ready to meet in very deed the responsibility which is yours." The speech was condemned in certain quarters as discourteous to the government which was showing Mr. Roosevelt hospitality. On the other hand, Sir Edward Grey declared that Mr. Roosevelt had apprised him of his views beforehand and he added that he had seldom listened to anything with greater pleasure. Mr. Balfour, the Opposition leader, said that he never heard a speech dealing with the British problem "which was less deserving of the charge of being an insult to the country whose hospitality the speaker was at the time enjoying."

In the opinion of many such an outrage as the murder of Boutros brought discredit on the experiment of giving the Egyptians a larger share in the management of their own affairs. The experiment had been begun before Lord Cromer left Cairo and seemed a practicable compromise between the policy of evacuation and that of complete British control. But the government offices were full of disaffected persons, some of whom were members of the Nationalist club. Many secret societies were formed and plots against the British supremacy were constantly springing up. It was charged that the government showed little vigor in repressing these tendencies. On June 13 in a speech in the House of Commons, Sir Edward Grey declared that it was impossible to use the Legislative Council or the General Assembly for the improvement of Egypt, if they are to become, as has lately seemed to be their tendency, a mere instrument of the movement against British supremacy. He also declared that if the Egyptian Nationalists should continue their agitation against the British occupation it would be necessary to take active measures for the protection of Egyptian ministers. In view of the Nationalist agitation, it was not possible for the government to relax its repressive policy. On June 14 the Council of Ministers passed a measure giving the Assize Courts jurisdiction in press cases and also a measure for repressing secret societies, overruling the action of the Legislative Council, which had tried to reject or greatly modify these measures. Several sentences were imposed for seditious publications, and effective military preparations were taken for putting down disorders.

**GENEVA CONFERENCE.** The annual meeting of the permanent committee of the Young Egypt

party was held on September 14 under the presidency of Mohammed Fahmy. Mr. Keir Hardie was invited to take the chair and in a speech in which he attacked the speeches of Mr. Roosevelt and Sir Edward Grey, he urged unity of the Young Egyptians if they would rid themselves of English supremacy and also advised them to repudiate criminal or illegal methods. Resolutions were passed protesting against the continuance of British occupation and against Sir Edward Grey's speech, urging the issuance of a manifesto in England which should explain the real state of things. The Nationalists endeavored to secure permission from the French government to hold an Egyptian Nationalist Congress at Paris on September 21, but this was refused.

**ELECTRIC BATTERIES.** The progress of the Edison nickel-iron storage cell overshadowed all other achievements in the battery field during 1910. This cell has had a nominal commercial status for over five years, but recent improvements have given it a great impetus. The electrolyte consists of potassium hydrate with a small addition of lithium hydrate. The positive plates of the new type consist of a nest of small steel tubes filled with nickel oxide and flakes of electrolytic nickel. The negatives are nickel-plated steel grids with flat rectangular pockets.

The lead-acid cell suffers a constant loss of capacity when in service, deteriorates badly when left idle, especially if discharged and is severely injured by short circuits. Its plates are liable to warp or buckle from unevenly distributed chemical action and a deposit settles to the base of the cell which tends to cause a short circuit

in time unless occasionally removed. The tests reported indicate that the nickel-iron cell has none of these defects. It tends to increase in capacity if the electrolyte is properly maintained. Short circuits and periods of idleness have little detrimental effect upon it. Cells taken from a motor truck after running 17,000 miles gave better tests than new cells under laboratory conditions. A feature of Edison cells which assures them extensive use in the electric vehicle field is their large storage capacity per unit of weight, 14 watt-hours per pound from the smaller cells and 16 from the larger.

A competitor for the Edison cell has been invented by Morrison. It also has a caustic potash electrolyte, but its positive plates consist of an oxidized amalgam of copper and its negatives of zinc chromite. It is claimed to have a capacity of 25 watt-hours per pound and to be almost indestructible.

The lead-acid cell advanced but little in 1910. A new process of plate manufacture was developed by Salom, who produces the active materials chemically and incorporates them into active grids by hydraulic pressure without electrolytic forming. It is claimed that the plates so obtained excel in durability and maintenance of capacity.

The popularity of electric storage battery vehicles of every type increased greatly in 1910. Experience has shown the storage battery truck to be remarkably reliable and efficient for heavy commercial haulage. Central station managers have worked actively to promote electric vehicles as the supply of current for charging is a most attractive off-peak load and one which can be furnished very profitably at low rates within restricted hours.

Large installations of batteries for load regulation and stand-by service were very few. In almost every case preference was given to steam turbine generating equipment, which has much of the flexibility of the storage battery and is much cheaper. The storage battery has been expected to play an important part in the application of gas engines to electric generation, but the cost of such combination has remained so high as to discourage such installations.

A new primary cell known as the Bleack-Love was brought out in England. It is a two fluid cell and gives a constant pressure of 2.7 volts with a large current capacity.

#### **ELECTRIC HEATING AND COOKING.**

Continual progress in the introduction of heating and cooking devices operated by electricity was noticeable throughout the year. Central stations, recognizing the importance of this kind of load, have, through their business-getting departments, made great efforts to popularize the use of that kind of apparatus; and a great variety of such energy consumers is obtainable. It must be said, however, that the competition set up by gas is a powerful restraining factor to the adoption of electric cooking apparatus; and what is equally important, these latter give their most satisfactory results only when used with intelligence, which unfortunately is not a common characteristic of household servants. The fact that electric toasters, coffee percolators, chafing dishes, plate warmers, etc., are being increasingly sold and used, shows a growing understanding by the public of the use and management of them.

Of the portable heating devices, electric flat-irons have had the largest sale, and next to

these, electric heating pads. Where heating of rooms and apartments is common, there is a tendency to abandon the direct-radiation resistance coil in favor of devices in which the heat is absorbed by water in a tube or jacket surrounding the coil, thus making it possible to store heat during times of small demand for lighting, and incidentally to furnish hot water for domestic use. Furthermore, it is calculated that in order to compete with gas selling at \$1 per thousand feet, electricity must be sold at the rate of 3 cents per kilowatt hour. As regards electric heating for industrial purposes, slow progress is reported at present, and nothing notable in the way of apparatus was brought out during the year.

#### **ELECTRICITY IN RURAL DISTRICTS.**

While the adoption of electricity by the farmers on a general scale can scarcely be said to be noticeable, yet, taking the United States as a whole, it is increasing in use for a variety of purposes through widely scattered regions. In many places, gasoline engine generator sets are in use for lighting farm dwellings, barns and outbuildings; in other localities, where a transmission line is available, energy is sold to farmers along or adjacent to such a line. In a few instances, those living along the route of interurban trolley lines are supplied from the trolley wire at 500 volts, direct current, on a grounded circuit, using five lamps in series; and occasionally a 500 volt motor for pumping water has been installed. There is as yet no uniformity in charges for energy in the cases cited. The use of necessarily small transformers for supplying individual customers is objectionable on the score of inefficiency; and the various questions as to which party is to bear the expense of the pole line construction from the main transmission line to the often remotely situated farm buildings, lamp renewals, maximum demand, etc., are not fully worked out.

For irrigation purposes, there is a real demand, not limited to any State or locality, for cheap power to operate pumps; and in this direction there is a noticeable growth in the use of electricity which is fostered and assisted by the awakening of the people to the necessity of intensive methods of cultivation, where success may depend largely on the cost of irrigation pumping.

**ELECTRIC LAMPS.** See **ELECTRIC LIGHTING.**

**ELECTRIC LIGHTING.** The exceptional progress in the art of electric lighting which marked the three preceding years was well sustained in 1910. It was marked, however, by the widespread use of the new illuminants and great improvement in the standards of illumination rather than by the introduction of new forms of lamps. The new lamps were first placed on the market with a full realization of their defects and the resources of investigation and invention have been assiduously employed to remove them. During the year the performance of metal filament lamps was improved fully 50 per cent., price, durability, efficiency and maintenance considered. The tungsten lamp of large size arrived and at once became the active rival of the enclosed arc in what had previously been the latter's exclusive province. The 500-watt lamp was auspiciously launched and the 1000-watt lamp promised by American manufacturers. The latter type is already produced in Germany. At the other extreme tungsten lamps giv-

ing 16 candlepower at 110 volts were introduced.

The announcement of a commercial process of producing ductile tungsten was easily the most noteworthy event of the year in the incandescent lamp realm. Drawn filaments were made for experimental purposes only. An extremely severe test of experimental lamps was conducted in connection with the acceptance trials of the battleship *Delaware*. The drawn wire lamps withstood the concussion from broadsides far better than carbon filaments of the sturdiest type. When the lamp is perfected for commercial use it is predicted that it will equal in efficiency and surpass in durability all its predecessors of every type. As malleable tungsten is stronger than the best steel and is extremely refractory it is expected that it will find a large place in other arts. The metallized carbon filament has undergone constant improvement. There is much evidence that the possibilities of carbon as a filament material are far from exhausted and that its efficiency and strength may be yet so improved as to assure its permanent place in the art.

There has been a marked tendency to minimize the candle-power rating of incandescent lamps. American makers have now substituted a three-voltage rating, in connection with a wattage rating. Each voltage corresponds with a certain efficiency and life performance and the buyer may select the lamp best suited to his conditions.

The progress in the art of arc lighting was largely along commercial lines with minor improvements in design and performance and no innovations of importance. Magnetite arcs of high power increased greatly in favor as street lighting agencies. The titanium carbide arc which was designed to combine the efficiency of the metallic arc with the advantages of alternating current supply has proven a disappointment and has ceased to be a commercial factor in the art. In the development and use of flame arcs Europe is still in advance of America though the domestic types are steadily improving.

An unprecedented amount of research has been devoted to the theoretical side of light production, especially in the field of selective radiation. It has been quite definitely established that metal filament lamps owe much of their gains in efficiency to this principle. Researches on the light of the fire-fly and other natural sources of phosphorescence attracted great interest, for it is suspected that the profound secrets concealed in these extremely efficient light sources may some day make revolutionary changes in the practical art of light making. The wide diversity of color values displayed by recent illuminants has brought a difficult photometric problem to a state of commercial importance, as it is necessary to rate such lamps in terms of existing standards. No complete solution of the color photometry problem has been reached, but the work of 1910 has brought it much nearer. Announcement was made that a phosphorescent reflector has been devised for application to mercury arcs. The surface is coated with a material which transforms certain of the blue and green rays which fall upon it into red and thus improves the color of the light for general use.

The pessimistic fears that central station revenues would be greatly reduced by the general use of new high efficiency lamps have not been realized though there has been a very active

movement so to modify the rates for lighting service that the advantages of cheaper light may be equitably shared by the central stations and consumer.

**ELECTRIC MOTORS.** See AERONAUTICS; AUTOMOBILES; DYNAMO-ELECTRIC MACHINERY, ETC.

**ELECTRIC POWER TRANSMISSION.** See TRANSMISSION OF POWER.

**ELECTRIC PUMPING STATION.** See PUMPING MACHINERY.

**ELECTRIC RAILWAYS.** Electric traction developments in 1910 were more conspicuous in the operating departments than in the realm of new construction. The great metropolitan electrification schemes so prominent in the years immediately preceding culminated in the inauguration of service through the Hudson River, Manhattan Island and East River tunnel system in connection with the superb new Pennsylvania terminal at New York, while the New York Central terminal was urged forward toward completion. It was announced that the New Haven system was about to construct connections via Long Island with the Pennsylvania terminal system. A report of the New Haven and New York Central systems on the proposed electrification of the Boston terminal zone estimated the cost at \$40,000,000 and favored the gradual introduction and extension of electric motive power. No immediate action was promised. Agitation for terminal electrification continued actively in Chicago and Philadelphia, but without concrete progress.

**SINGLE PHASE INSTALLATIONS.** The acquisition of the control of the Boston & Maine by the New Haven system and its decision to proceed actively to electrify the Hoosac tunnel in western Massachusetts together with its approaches, the Harlem River branch and the New York, Westchester and Boston branch, all with single-phase, alternating-current equipment continuous in its main features with its present main-line system is noteworthy, indicating as it does the practical commitment of the great New England trunk lines to the single-phase type of electrification. Other important extensions of single phase operation were made on the Spokane and Inland Empire, the Rock Island and Southern and the Chicago, Lake Shore and Southern railways. The latter road did noteworthy work with single-phase, multiple-unit trains, handling eleven cars at high speed with a single master controller.

Single-phase installations of magnitude were also made in Europe, the most noteworthy being that of the Midi Railway of France which began the electrification of 70 miles with a 12,000-volt trolley system, using motor cars for passenger traffic and locomotives for freight. Ultimately the entire 200 miles between Toulouse and Bayonne will be similarly equipped, forming the most comprehensive electrification scheme yet undertaken in France. Though much criticised and suspiciously regarded in the past, the record of the single-phase system in 1910 was one of great progress, both in equipment and operating records, pointing to a great future in fields of traction where the power transmission problem is the dominating one.

**THE 1200-VOLT DIRECT CURRENT SYSTEM.** Equal success attended the 1200-volt direct-current system of interurban traction. The most notable new installations were the extensive suburban system of the Milwaukee Electric Rail-

ways and Light Co., the Washington, Baltimore and Annapolis line and the Aroostook Valley system. The motors of these cars are wound for 600 volts and insulated for 1200. Interpoles are used to assist commutation. The motors are operated in sets of two in series, the line voltage being supplied from an alternating current transmission system by two synchronous converters run in series on the direct-current side. The cars and their equipment are much lighter and more economical of power than single-phase cars.

**THE THREE-PHASE SYSTEM.** The three-phase system using induction motors was largely extended on the state lines of Italy, following the great success of the Valtellina line. For this work an appropriation of \$60,000,000 was made available. Forty 60-ton locomotives of 800 horsepower each were ordered. Each has two 3000-volt three-phase induction motors which may be connected in series or in parallel, giving two inherent speeds with intermediate steps provided by resistance control. These locomotives are noteworthy for their great haulage capacity per ton, which is more than twice that obtainable with direct-current or single-phase motors.

**IMPROVED CONSTRUCTION.** The success of the new types of American locomotives brought out in 1909 points to the marked superiority of large motors mounted on the main frames over the earlier types with truck-suspended motors. The reduction of dead car weight has engaged engineers for many years. Cars of exceptionally light construction operated by storage batteries of the new Edison type were experimented with by cross-town lines in New York formerly drawn by horses and mules. The marked success led to extensive installations and the early elimination of animal motive power is expected. The storage battery car revives an old idea discarded because of the fatal defects of lead cells. The new batteries are light, efficient and capable of withstanding the severest service without rapid deterioration.

**TROLLEY-BUS SERVICE.** The inauguration of trackless trolley-bus service in the suburbs of Los Angeles opened a new field in American traction. The development of a subway car suited to the needs of moderate sized cities was announced by DuPont, whose experimental installation at Cleveland attracted much favorable attention.

**CAR AND TRAIN OPERATION.** Much attention was paid to the problems of economical car and train operation by the important rapid transit companies. Checks on the efficiency of motormen made by the Manhattan Railway, using car metres and coasting recorders, brought out the fact that skillful handling of trains with rapid acceleration and full use of coasting produced a saving of energy of 36 per cent., as compared with careless operation. The money value of such a saving, which in the case of elevated trains is from two to three times the wage of experienced motormen, emphasizes the human factor in economical management. Satisfactory trials were made of ball and roller bearing for motor and car journals, the energy-saving ranging from 15 per cent. to 21 per cent. in comparison with common bearings.

**NEW YORK'S SUBWAY QUESTION.** In the field of public relations the struggle between contending interests in New York attracted great attention. The year closed with the transportation commission of the city apparently committed to the non-competitive development of subway traffic by the Interborough Rapid Transit Co.,

despite a considerable weight of public opinion favoring competitive development. For an account of the electrification of the Pennsylvania, Michigan Central and Cascade tunnels, of a suburban branch of the New York Central and of other electrification work completed during the year, see **RAILWAYS**.

**ELLIOTT, AARON MARSHALL.** An American philologist and educator, died November 9, 1910. He was born in Wilmington, N. C., in 1846 and graduated from Haverford College in 1866 and from Harvard College in 1868. He studied in France, Italy, Spain, Germany, and Austria until 1876. From that year until 1894 he was associate in Romance Languages at Johns Hopkins University. He was associate professor from 1894 to 1892 and professor from 1892 until the time of his death. His researches in mediæval French languages were especially notable. Among the best known of these were the works of Marie de France. Dr. Elliott was for seven years secretary of the Modern Languages Association of America and was a member of many scientific associations, including the American Philological Association and the American Archaeological Association. In 1907 he received the decoration of the Cross of the Legion of Honor in connection with his work in Romance language and literature. In 1900 he was a delegate from the United States to the Paris Exposition.

**ELLIS, JOHN W.** An American banker, died December 28, 1910. He was born in Williamsburg, Ohio, in 1817 and was educated at Kenyon College. At the age of 18 he engaged in the banking business in Cincinnati, where he was successful and came to be regarded as the leading financier of that city. When the national banking system was organized under President Lincoln's administration he was among those called into consultation by Mr. Lincoln. He was president of the first national bank organized in the United States. He was afterwards president of the Chicago, Hamilton and Dayton Railroad and in 1870 became manager of a banking house in New York City. Ten years later he retired from active business life.

**EMPLOYERS' LIABILITY. PROGRESS IN 1910.** This subject received continuous discussion and there were a number of new laws passed concerning it during the year. These served to greatly advance the movement away from the traditional form of employers' liability to the newer form of workmen's compensation

for unavoidable injury while at work. National conferences were held at Washington in January and at Chicago in June. The special commissions in New York, Wisconsin, and Minnesota either continued investigations or reported their results; new commissions were appointed in Illinois, Ohio, Massachusetts, and New Jersey. Congress provided for a commission with an appropriation of \$15,000 to inquire into employers' liability and workmen's compensation, authorized the Interstate Commerce Commission to investigate the causes of accidents, and amended the Federal law so as to facilitate workmen's suits for damages. A committee of the National Association of Manufacturers was sent abroad in the fall to investigate the practical workings of the compensation schemes of Europe. A previous committee of this Association did not express itself favorably disposed toward the strong tendencies to break down the common law doctrines of assumed risks, contributory negligence, and the fellow servant rule, but it gave warning that many forces were operating to institute the English system of workmen's compensation.

**INDUSTRIAL ACCIDENTS.** Some statistics of industrial accidents were given by Mr. John H. Hammond at the Conference on Uniform Legislation at Washington, D. C., January 18. He stated that the disaster at the Cherry, Illinois, coal mine cost 300 lives and \$500,000 in direct losses to the public and the coal companies. The average number of miners killed per 1000 employed in various countries he gave as follows: France, .91; Belgium, 1; Great Britain, 1.28; Prussia, 2.06; United States, 3.39. Moreover mine casualties had increased in the United States while decreasing in Europe. Very similar ratios were given by Mr. John Mitchell in the *American Federationist*; he showed that the total number of persons killed in the mines in twenty years preceding 1909 was 19,775 in the United States; 10,319 in Great Britain; 8460 in Prussia and 2944 in France. According to the *Insurance Age* the total number of wage earners killed by industrial accidents in the United States is between 30,000 and 35,000, while the number of non-fatal accidents exceeds 2,000,000.

**WORKMEN'S COMPENSATION.** The development of sentiment in favor of workmen's compensation was advanced by the report of a special committee of the New York Bar Association at its annual meeting in February. This committee favored the shifting of the burden of accidents from workmen and employers to the industry, and consequently to the consumer, by means of definite compensation prescribed by law. It declared for the English idea of workmen's compensation as against the German idea of workmen's insurance. In her volume on *Work—Accidents and the Law*, one of the volumes of the *Pittsburg Survey*, Miss Crystal Eastman drew the conclusions that many accidents are inevitable in the nature of modern business, and that they can be reduced, not by throwing heavier burdens of risk on imperfect human nature, but by legal regulation of industries. She pointed out that accidents are being reduced both by limitation on production, and such as shorter hours, slower speed and restriction on the employment of inexperienced persons and by the use of the police power, such as greater safety requirements, better inspection and more effective warnings and signals.

**CHANGES IN THE NEW YORK LAW.** The

New York State Commission, appointed early in 1909, made its report to the State legislature on March 19. The commission was continued with twice the original appropriation to investigate the subjects of cause and prevention of accidents, unemployment and scarcity of farm labor. As to the then existing system of employers' liability the commission stated that it was economically unwise and unfair, and, in operation, wasteful, uncertain, and productive of antagonism between workmen and employers; that it was satisfactory to none and tolerable only to those who practically disregarded their legal rights and obligations; that its evils were most marked in hazardous employments; and that workmen do not and cannot provide adequate accident insurance, and therefore the heaviest burdens fall upon those workmen and families least able to bear them. On the basis of its inquiries the commission formulated two bills representing the most advanced American legislation on this subject. These were accepted by the legislature and became effective September 1. The first of these modifies the common law principles and presents a voluntary compensation plan; the second requires compulsory compensation for accidental injuries in certain specified dangerous occupations.

The common law principles, that is, the fellow servant doctrine, the doctrine of contributory negligence, and the doctrine of assumption of risk, are greatly modified. It is provided that the injured worker may recover if the fellow servant whose negligence caused the injury is in any degree whatever in authority under the employer. The burden of proof as to contributory negligence is shifted from the employee to the employer. And it is provided that the worker shall not be deprived of compensation for assuming the risk, even though he continue at work, if, through any fault on the part of the employer, there exists danger which the employer knows of or could discover by reasonable inspection. In this same law is the provision of an optional compensation plan which may be applied to any industry. It is made possible for any employer and any of his employees in any trade to agree in writing to institute the statutory provisions for workmen's compensation. In making such an agreement the employee surrenders his right to sue for damages in court. This agreement may be cancelled by either party on sixty days notice. No compensation is to be given for an injury that does not disable the employee for at least two weeks; the rates of compensation are the same as in the compulsory sections noted below.

Compulsory workmen's compensation is required in the following occupations: bridge building; all structural steel work; tunnels and subways; work on scaffolding twenty or more feet in height; labor done in compressed air; construction, operation or repair of apparatus charged with electric currents; work near explosives; and railway operations. In any of these trades workmen injured as the result of necessary risks or of negligence on the part of the employer or his agents are entitled to compensation without suit at law on the basis of a scale set forth in the law itself. Maximum compensations are provided by the statute; thus, for death of a husband, the compensation shall be 1200 times his average daily wage, but shall not exceed \$3000; for serious injury the compensation shall be one-half the average weekly wage,

but shall not exceed ten dollars per week. No compensation, however, can be obtained when the accident is due to the serious misconduct of the worker. In case of a just claim the worker must make a choice between suing the employer for damages or the acceptance of the compensation provided in the law; having chosen one of these alternatives, he cannot later, if dissatisfied, choose the other. Some doubt was expressed as to the constitutionality of this mandatory law on the ground that it constitutes the taking of property without due process of law; but the commission held the law to be a legitimate exercise of the police powers of the State. Though these laws are far below the English standard, they were deemed sufficient as a first trial step in the direction of a complete application of the principle of compensation as against employers' liability.

At the annual meeting of the Liability Insurance Association it developed that one of the effects of the foregoing legislation was to raise employers' liability insurance rates by about 20 per cent. It was charged by some of the insurance officers that many contractors were not taking into account the increased liability imposed upon them by the law, but planned to escape in the case of a big accident by declaring themselves bankrupt.

The constitutionality of the New York law was attacked by the South Buffalo Railway Co., in October, on the ground that it deprived the employer of property without due process of law, denied him the equal protection of the laws, violated the right of trial by jury, and limited the amount recoverable as damages for injury resulting in death. None of these pleas was recognized. Moreover, the court held that, while there is no absolute certainty that the legislature may impose liability upon an employer without fault on his part, yet "every presumption is in favor of the constitutionality of the act;" the legislature may rightly shift part of the responsibility for injuries arising out of the necessary risks of an employment from the employee to the employer. The case was appealed.

**OTHER LEGISLATION AND DECISIONS.** The National Civic Federation through its Department of Compensation for Industrial Accidents and their Prevention began, in October, the collection of data with a view to the general substitution throughout the country of workmen's compensation for employers' liability. The work of the Federation was divided between various committees having as their duties the drafting of a law to serve as a model for uniform State legislation; the investigation of the cost of the proposed substitution; and the formulation of proposals for the improvement of factory inspection with a view to the prevention of accidents.

Workmen's compensation laws were considered by the legislatures of New York, Wisconsin, Minnesota, New Jersey, Illinois, Massachusetts and perhaps some other States. Congress slightly modified the Federal employers' liability law and a bill for Federal compensation was introduced. Some of these bills provided for accident insurance on a contributory basis, both employees and employers to share the expense, but most of them looked to definite compensation without contributions from workers. In Wisconsin the Supreme Court held that a non-resident alien cannot sue for damages due to

the death of a relative because the statutes are not framed for his benefit. This was in harmony with a decision of the United States Supreme Court in 1909, and, on account of the multitudes of alien workers in the country, discloses a serious defect in legislation. New laws in Ohio and Georgia increased the responsibility of the employer for the negligence of his agents and reduced the force of the common law doctrines, the Georgia act applying only to railroads. The violation of a safety statute by the employer was declared to make contributory negligence of the employee immaterial. In both States also the doctrine of assumption of risks was abrogated in industries covered and contracts to forego the benefits of the law were declared void. Ohio declared contributory negligence of employee no bar to recovery when employer's negligence is gross in comparison. In Ohio minors, employed contrary to the child-labor laws, may not be deemed guilty of contributory negligence, nor to have assumed any risk.

**CORPORATION PLANS OF COMPENSATION.** In April the United States Steel Corporation announced the introduction of its own system of voluntary compensation for injured workmen. Negligence of workers is not taken into account; but intoxication bars compensation. By this plan unmarried men temporarily disabled receive thirty-five per cent. of their wages and married men temporarily disabled fifty per cent., with an additional five per cent. for every child under sixteen years and two per cent. for every year of service above five years. For permanent injuries some compensations are given, depending on the extent to which employment is interfered with and on the annual earnings of the injured man. Widows and children of men who are killed will receive one and one-half years' wages, and an additional ten per cent. for each child under sixteen, and three per cent. for every year of service above five years. This scheme applies to more than 200,000 workmen; and was considered wise from both a humanitarian and a business point of view; but there was doubt as to the sufficiency of the compensation provided, especially for single men and aliens whose families were still abroad. The corporation has made systematic efforts to diminish accidents. At about the same time the International Harvester Company announced a similar plan. As in the above scheme workers may accept the plan and give up their right to sue or may not accept and retain this right. Compensation equals three years' wages, not less than \$1500 nor more than \$4000, in case of death; for the loss of one hand or foot, one and one-half years' wages, not less than \$500 nor more than \$2000; for the loss of both hands or feet, or one hand and one foot, four years' wages, not less than \$2000; permanent disability secures a pension; and minor injuries secure one-fourth to one-half wages, depending on whether disability lasts less or more than thirty days. The plan also provides that a workman may contribute from six to ten cents a month and have his compensation increased.

**PENSIONS FOR SURVIVING RELATIVES.** The newer view is that there can be no compensation for an accident resulting in the death of the bread winner of a family; and that, therefore, whatever payment is made should be looked upon as relief from possible poverty and distress. Along with this goes the conviction that less distress is occasioned in the long run among the

widows and children of killed workmen if this relief is given in the form of annual pensions instead of in a lump sum, as heretofore has been the rule. Thus the British Royal Commission on the Poor Laws and the Relief of Distress, after most extensive inquiry, declared that "no commutation of weekly compensation payments should be permitted and no lump sums paid in respect of fatal accidents . . . and that such sums should in all cases be invested in trust for the maintenance of those from whom the accident has withdrawn the means of support." This principle has been adopted by the committees having in charge the distribution of relief for those suffering from the Monongah, the Darr, and the Cherry mine disasters of 1907-9. These committees had together about a half million dollars, to which should be added one hundred thousand dollars disbursed by the State of Illinois for relief at Cherry. The Cherry Commission divided its beneficiaries into two classes: the first included widows residing in the United States whose children were all under fourteen years; the second all others. A widow with one child receives twenty dollars a month until the child is fourteen; five dollars is added to the pension of each widow for every additional child. These payments are continued until two, or sometimes three, of the children are fourteen years of age. Payments to the second class are made in lump sums. See OCCUPATIONAL DISEASES.

**EMPLOYMENT.** See UNEMPLOYMENT.

**ENDOWMENT.** See UNIVERSITIES AND COLLEGES.

**ENGINEERING.** The topics in the various branches of Engineering are treated in the present work under their respective titles. Thus subjects in Civil Engineering will be found under such titles as BRIDGES, CANALS, CONCRETE, DAMS, FOUNDATIONS, RAILWAYS, TUNNELS, etc.; in Sanitary Engineering under GARBAGE DISPOSAL, SEWAGE PURIFICATION, STREET CLEANING, SANITATION, WATER PURIFICATION, WATER WORKS; in Electrical Engineering, under ELECTRIC LIGHTING, TRANSMISSION OF POWER, ELECTRIC RAILWAYS, DYNAMO-ELECTRIC MACHINERY, WIRELESS TELEGRAPHY, WIRELESS TELEPHONY, etc.; in Chemical Engineering, under COPPER, IRON AND STEEL, the articles on metals and minerals, AGRICULTURE, AGRICULTURAL EXPERIMENT STATIONS, CHEMISTRY, INDUSTRIAL, etc.; in Mechanical Engineering, under AERONAUTICS, AUTOMOBILES, BOILERS, INTERNAL COMBUSTION ENGINES, etc.; in Marine Engineering, under SHIPBUILDING, NAVAL PROGRESS, BATTLESHIPS, etc. See also the articles on the various industries and minerals, PAVEMENTS AND ROADS, MUNICIPAL GOVERNMENT, IRRIGATION, DRAINAGE, etc.

**ENGINEERING EDUCATION.** See UNIVERSITIES AND COLLEGES.

**ENGINES.** See INTERNAL COMBUSTION ENGINES.

**ENGINES, FIRE.** See FIRE PROTECTION.

**ENGLAND, CHURCH OF.** A religious denomination which is the "Established Church of England" and the dominant religious body of that country. The title must not be confused with the Anglican Church, which includes that group of dominant churches which are in communication with or have sprung from the Mother Church of England. These churches are the following: Church of Ireland, Episcopal Church of Scotland, the Protestant Episcopal Church of the United States of America, the Church of

Canada, the Church of Australia, the Indian Church, and the Church of South Africa. These churches are all independent in their jurisdiction and are not amenable to the ecclesiastical courts of that church.

No census of the church membership of the Church of England has been made in recent years. The number of communicants is estimated at approximately 2,500,000, while the church sittings number about 6,000,000. The number of the clergy in England and Wales is about 23,000, of whom 14,750 are beneficed, and 7770 are assistant curates. The total amount contributed in voluntary offerings to the Church of England for the year 1909 was £8,060,289. The revenues from church property amounted to £5,753,557. At the head of the Church of England are 37 bishops, of whom two, Canterbury and York, are archbishops. The bishops superintend the work of each diocese and are aided by the suffragan or assistant bishops, of whom there were 37 in 1910. The bishops are appointed by the King and have a seat in the House of Lords.

Of great interest in the history of the church in recent years has been the Brotherhood movement, which has grown rapidly. It is a development of the Pleasant Sabbath Afternoon Association, which was an attempt to attract men who did not attend the ordinary Sunday service. The Brotherhood movement binds together the members of the society into a union, which manages its own affairs and selects its own officers and speakers.

The problem of increase of candidates for the ministry has proved serious in the Church of England in recent years. The church makes no financial provisions for the training of the ministry and the old universities are no longer sending the majority of their students into the ministry of the national church, while the new universities fail to supply the deficit. The announcement by the bishops that after 1917 they would ordain no candidate who was without a degree has proved a premature decision and it is to be reconsidered. It is becoming evident that the church will need to provide for the free education of candidates for the ministry whose only bar is poverty.

After a period of freedom from ritual troubles, there was an outbreak at Brighton during the year. The Bishop of Chichester had sent out a pastoral letter to the clergy of his diocese, based on their replies to his visitation questions. The Bishop objected to certain practices which he regarded as unlawful, and in particular he ordered that the Sacrament should not be reserved except for its primitive and catholic use, namely, for the sick and dying, and that it should not be used at any public service, such as exposition and benediction. The vicars of four Brighton churches could not adopt the Bishop's views and two of them resigned their benefices.

**ENGLISH ARCHITECTURE.** See ARCHITECTURE.

**ENROLLMENTS, SCHOOL.** See EDUCATION IN THE UNITED STATES, and under different States and countries.

**ENTERIC FEVER.** See TYPHOID FEVER.

**ENTOMOLOGY.** As compared with other countries, economic entomology receives in the United States an unusual amount of attention,

research on local entomological problems being an important part of the work of every Agricultural Experiment Station (q. v.), and publications of these stations should be consulted by all who are interested in these local problems.

**INTRODUCTION OF FOREIGN PARASITES.** The most important single investigation is the joint work of Federal and State entomologists on the control of gypsy and brown tail moths in eastern New England. As was stated in earlier **YEAR BOOKS**, parasites of these forms have been imported from Japan and eastern Asia, and results thus far obtained give reason for believing that these may eventually aid in controlling the pests, though not enough time has yet elapsed for any very conclusive statements to be made. Rogers and Burgess published in August, as a Bulletin of the Bureau of Entomology, U. S. Department of Agriculture, a summary of the results thus far obtained. The report itself should be consulted for details. The authors evidently regard improvements in methods of spraying as the line along which the best immediate results will be obtained. While theoretically important, the introduction of foreign parasites is necessarily a slow process, and it will probably be several years before any sort of control can be got in that way. The territory now covered by these insects covers approximately 7900 square miles, about three-quarters of which is wooded and therefore difficult to treat. Owners of land in the infested area are advised that proper care of apple trees will keep them free from the pests, and that if woods are cleared of brush, or cut, and the ground replanted with ash, hickory, or conifers, which are not so liable to attack from the insects, some loss may be saved.

**SPREAD OF THE MOTH PEST.** New light was thrown on possible means of transportation of gypsy moth eggs by feeding them to English sparrows in captivity. Forty per cent. of the eggs passed the intestines of the birds unchanged, and of these five per cent. subsequently hatched. While these experiments were on birds in captivity, where conditions are abnormal, the digestive processes being noticeably less vigorous than when the birds are free, it is probable that this might occur under the latter conditions, and thus the eggs be scattered. A gypsy moth colony was reported from Wallingford, Conn., a locality previously free from them. It was also discovered in 1910 that quantities of the brown tail pests were being imported on nursery stock from France. Prompt action on the part of entomologists of several States had, it was believed, prevented the colonization of any of these, but it is important to guard against this method of infection, especially in stock from France, where inspection measures are very inadequate.

**THE BOLL WEEVIL.** In the southern United States successful treatment of the cotton boll weevil with arsenate of lead was reported. The spread of this weevil has led farmers of infested sections to abandon cotton raising, and to plant corn instead. This seemed at first to be extremely profitable, but the corn was reported in 1910 as liable to attacks of other weevils, against which no very adequate protection had been discovered.

**SUPERPARASITISM.** One difficulty in the application of the treatment of injurious insects by parasites has been indicated by Fiske, who shows that a parasitic insect shows very little

ability to judge of the suitability of the host for its eggs and often lays eggs on a host which is already parasitized by other insects. In this case, either one form dies and the other lives, both die, or what very rarely happens, both live and develop. This superparasitism is very common, and is an important complication to be considered in connection with the control of such forms as the gypsy moth by parasites.

**BLACK FLIES.** In mountain regions, the "black flies" which breed in the beds of mountain brooks are often a very serious annoyance to the inhabitants, since from their small size it is impossible to screen them from houses without making the screens so tight as practically to shut off ventilation. Sanderson stated that it is possible to kill the larvæ of the most annoying of these insects, *Simulium hirtipes*, by spraying the surface of the water of the brook with phenol oil. Care has to be taken not to make the solution so strong as to injure the fish.

**TYPHOID FLY.** Felt published results of experiments on the question as to whether the common or "typhoid" fly will breed freely in dark places, and concluded that they will not go into dark places to lay their eggs. These conclusions, if true, maybe of value in handling the fly nuisance, as it is evidently easier to make manure pits, etc., dark than to effectively tighten them against the entrance of insects.

**LOCUST PROBLEM.** In South Africa the locust problem has been a serious one, the damage done in 1906 having been estimated at £1,000,000. The most destructive species is the brown locust (*Pachytylus subcollis*). It was reported in 1910 that good results had been obtained by spraying the veldt in front of an advancing swarm with a mixture of treacle and arsenate of lead. The insects were very fond of the treacle and died in large numbers in consequence of eating the mixture. It often happened that a second swarm, immediately following the first, would eat these dead insects and be poisoned by the arsenate of lead contained in their bodies.

**INSECTS AND PROPAGATION OF DISEASE.** The question of the relation of insects to the transmission of diseases through the carrying of trypanosomes received a great deal of attention during the year. See **INSECTS AND THE PROPAGATION OF DISEASES; SLEEPING SICKNESS; PELLAGRA.**

**STUDIES OF THE HONEY BEE.** Lovell stated that experiments on the color discrimination shown by honey bees showed that they can discriminate between different colors, but that if there is any advantage in doing so, they will learn not to discriminate. Snodgrass, in a paper from the Bureau of Entomology of the U. S. Department of Agriculture, has published an elaborate description of the anatomy of the honey bee, intended to be a final authority on this subject, and to correct errors made by previous describers.

**ENTWISTLE, JAMES.** A rear-admiral (retired) of the United States Navy, died March 23, 1910. He was born in Paterson, N. J., in 1837 and was educated in the public schools of that city. He enlisted in the 8th Regiment of the New York State militia in 1861 and took part in all subsequent battles of that regiment, including the first battle of Bull Run, until he was discharged at the expiration of his enlist-

ment. He then passed the examination and was appointed to the engineer corps of the navy as third assistant engineer and was detailed for duty on the gunboat *Aroostook*. During the greater part of the war he served under Admiral Farragut. In January, 1897, he was ordered to duty on Admiral Dewey's flagship, *Olympia*, and took part in the battle of Manila Bay. He was heartily commended by Admiral Dewey and received the Dewey medal. He was also recommended for advancement in numbers for eminent and conspicuous services in this battle, and was placed on the retired list with the rank of rear admiral in July, 1899.

**EPIGRAPHY.** See PHILOLOGY, CLASSICAL.

**EPILEPSY.** To an already long list of drugs used for epilepsy, the venom of the rattlesnake (crotalin) was added by Spangler of Philadelphia, who gave it in eleven cases of the disease, following the observation that a man had been cured of epilepsy by the bite of a rattlesnake. The dry glycerized venom was given in injection in minute doses, which were gradually increased. A profound impression is made on the nervous system. Cures were made lasting three months and a year, and a general lessening of severity and frequency of attacks was the rule. Crotalin was used empirically and its author has no theory as to its *modus operandi*. Ehrlich's "606" (see ARSENO-BENZOL) was also used with success in Germany in cases of epilepsy in which a syphilitic etiology existed.

The 16th annual report of the Craig Colony for Epileptics at Sonoma, N. Y., calls attention to the frequency of accidental death during epileptic seizures, and the necessity of keeping epileptics under close observation at all times. The high death rate (582 deaths in 2732 patients in sixteen years) is shown not to be due to the disease itself, but rather to various accidents, more than one-sixth of the deaths occurring in this way. The epileptic may injure himself fatally by violent falls, by drowning in the bath, or by suffocating himself in soft pillows, while unconscious. An International Association for the systematic study and treatment of epilepsy was organized in Budapest in 1909 and held its first meeting in Berlin in October, 1910. The transactions will appear in the journal *Epilepsia*.

**EPISCOPAL CHURCH.** See PROTESTANT EPISCOPAL CHURCH AND ENGLAND, CHURCH OF.

**EPISCOPAL CHURCH, REFORMED.** See REFORMED EPISCOPAL CHURCH.

**EPISTEMOLOGY.** See PHILOSOPHY.

**EPWORTH LEAGUE.** An organization of the young people of the Methodist Episcopal Church, founded in 1892. It is the largest society of young people in the world, and in 1910 it had a membership of about 80,000. During the year an advance was made in taking up work in foreign lands. Assistant secretaries were appointed for the mission fields of Mexico and southern Asia, and money was provided for the office and personal expenses of the secretaries, for the translation of literature for use in the work of the league and for systematic Christian instruction among the young people of the Spanish missions, and in several of the principal languages of India. The general secretary is Rev. Edwin M. Randall, M. D.

**EQUIPMENT, ARMY.** See MILITARY PROGRESS.

**ERBIUM.** See ATOMIC WEIGHTS.

**ERDMAN ACT.** See ARBITRATION, INTERNATIONAL.

**ERIE RAILWAY BRIDGE.** See BRIDGES.

**ERITREA.** An Italian colony on the African coast of the Red Sea. Area (estimate), 73,700 square miles. Population (largely nomadic), estimated at 450,000. Including the military there are 4607 Europeans (Italians, 3049). Capital, Asmara; chief port, Massawah (2275 inhabitants). Various animals (camels, cattle, sheep, and goats) are raised by the wandering tribes, and, with their products, are the main articles of local trade. The pearl fisheries yield annually 250,000 lire in pearls and 800,000 lire in mother-of-pearl. Gold mines are worked near Asmara. Imports and exports (1907), 10,605,877 and 2,188,205 lire respectively. Estimated revenue for 1908-10, 8,470,860 lire (colonial revenue, 2,623,000; State subvention, 5,847,960); expenditure, 8,470,960 (military, 4,443,200; civil administration, 4,027,760). Governor in 1910, Marquis Giuseppe Salvago Raggi. The Dahlak Archipelago (an important pearl fishery) is attached to Eritrea.

**ESPERANTO.** See LANGUAGE, INTERNATIONAL.

**ETHICAL CULTURE, SOCIETIES FOR.** The parent society was established in New York in 1875 by Felix Adler. Others sprang up later in Philadelphia, Chicago, St. Louis, Brooklyn, and elsewhere. The object of the society was to unite people of varying religious beliefs or none, in the ordinary acceptance of the term, upon the basis of devotion to the moral ideal. Interpreting the word "religion" to mean fervent devotion to the highest moral ends, the society is to be regarded distinctly as a religious body. But toward religion as a confession of faith in things superhuman, the attitude of the society is neutral. Neither acceptance nor denial of any theological doctrine disqualifies for membership. A recognition of the supremacy of the moral ideal and of the independence and sovereignty of the ethical factor in life is alone insisted upon as a basis of membership. The New York society is engaged in various forms of educational and philanthropic activity. Education has, from the first, been its chief care. Early in its history it established one of the first free kindergartens, and that has grown to the dimensions of the present Ethical Culture School. The membership of the New York society is about a thousand. The other societies are smaller, but are, most of them, engaged in educational and philanthropic work along the lines of the New York society. These societies are federated in the American Ethical Union, which conducts the *International Journal of Ethics* and a summer school of ethics, besides attending to the publication of the literature of the movement. This union is in turn related to the International Ethical Union, which, at a congress at Eisenbach, Germany, in 1906, adopted as its basis this declaration: "The general aim of the union is to assert the supreme importance of the ethical factor in all the relations of life, personal, social, national, and international, apart from all theological and metaphysical considerations." The societies for ethical culture hold regular Sunday meetings, Sunday schools, and various classes. Among the organizations of the parent society in New York are the Women's Conference, the Young Women's

Union, the Young Men's Union, the Hudson Guild, and the Down-Town Ethical Society. A new meeting house for the society, adjoining the School, Central Park West and 64th Street, has just been completed and dedicated. The officers in 1910 were: Felix Adler, leader; John Lovejoy Elliott, Percival Chubb, David Saville Muzzey, Henry Moskowitz, and Alfred W. Martin, associate leaders.

**ETHNOLOGY.** See ANTHROPOLOGY.

**EUGENICS.** See BIOLOGY, *Genetics*.

**EUROPIUM.** See ATOMIC WEIGHTS.

**EVANGELICAL ALLIANCE OF THE UNITED STATES.** A religious organization founded in 1867, with the object of manifesting and strengthening Christian unity, defending and promoting Christian liberty and to encourage coöperation in Christian work without interfering with the internal affairs of the denomination. The Alliance, in concert with the British Alliance, has defended and promoted religious liberty in countries where religious persecution was severe and persistent, and has prompted the observance of an annual week of prayer in all Christian lands and in all mission fields during the week beginning with the first Sunday of the year. The alliance is undenominational and all the evangelical bodies are represented in its board of directors. The activity of the alliance during 1910 was chiefly in preparing and publishing the Programme for the Week of United and Universal Prayer and sending it to 20,000 churches. The President of the Alliance is Dr. Leander T. Chamberlain, 222 West 23rd Street, New York.

**EVANGELICAL ASSOCIATION.** A religious denomination founded in 1800 by Jacob Albright. It was begun as a movement in the Methodist Episcopal Church to carry on work, especially among Germans. The Methodist Church did not care to labor in this field and Albright therefore devoted himself to those speaking the German language. It was not his original purpose to found a new church, but the movement grew to such proportions that it finally separated from the Methodist body, although there was no schism or sharp break. The doctrine of the denomination corresponds very closely to that of the Methodist Episcopal Church. According to the United States census of religious bodies made in 1906 and published in 1910, the total number of communicants in the former year was 104,898, with 1617 church edifices and 942 ministers. There were in addition 369 local preachers. According to statistics gathered by Dr. H. K. Carroll and published in 1910, there were in that year 106,957 communicants, with 1687 churches and 991 ministers. The denomination carries on mission work in Japan, China, Switzerland, and Canada. The most distinctively foreign mission work is that in China and Japan. The educational work of the denomination in the United States includes three institutions of higher grade, and two parochial or mission schools. The institutional or philanthropic enterprises of the church include an orphanage, a home for the aged, and a deaconesses' home and hospital. The church also maintains a publishing house at Cleveland, O. An important organization included with it is the Young People's Alliance, which had a membership of over 30,000 in the United States. The official organ is the *Evangelical Messenger*. Its other publications

are in English and German. The church has three bishops.

**EVANS, DUDLEY.** President of the Wells Fargo Express Company, died March 27, 1910. He was born in Morgantown, W. Va., in 1833 and graduated from Washington College in 1859. After his graduation he taught school until the outbreak of the Civil War. He then returned to Virginia and enlisted in the first Virginia infantry. He served with credit throughout the war and became colonel of the 20th Virginia cavalry. He was captured by the Federal forces near the close of the war and spent a long term in the military prison. After the close of the war he went to California and became connected with the Wells Fargo Express Company. He was successively manager, vice-president, and president of the company, having been elected to the latter office in 1901. He was twice appointed a member of the board of visitors at the United States Military Academy at West Point.

**EVERETT, WILLIAM.** An American educator and author died February 16, 1910. He was born at Watertown, Mass., in 1839, and was the son of Edward Everett. He graduated from Harvard College in 1859 and from Trinity College, Cambridge, in 1863. From 1870 to 1877 he was assistant professor of Latin at Harvard College and from 1878 to 1893 was master of the Adams Academy at Quincy, Massachusetts. In 1893-95 he served in Congress as a Democratic member from Massachusetts. He was an active civil service and tariff reformer. In 1897 he again became master of Adams Academy. Mr. Everett was one of the best known educators in the United States and had also a wide influence as a writer and speaker on economic and literary subjects. Among his published works are: *Changing Base* (1868); *Hesione, or Europe Unchanged*, a poem (1869); *Double Play* (1870); and *Italian Poets since Dante* (1904).

**EXPLORATION.** DETAILED SURVEYS IN AFRICA. Detailed exploration in Africa has made wonderful progress, but its completion will still require decades. Hundreds of official or independent observers are obtaining a good working knowledge of large districts, some of which comprise whole colonies or protectorates, as Togo, Sierra Leone and French West Africa. But in each of these districts there may be large areas of forests, for example, that have not yet been explored. Boundary and other official survey parties are still collecting a large amount of geographical data. Some of them, as in the French surveys, are especially instructed to collect all the facts they can gather relating to the various phases of geography and other earth sciences. These studies are appearing in various official reports and monographs, which embody the essence of what has been learned in one or another field of study. As an example, Franz Thonner, the Austrian botanist, has just published a work of 673 pp., and 150 plates,

briefly describing practically all the flowering plants of Africa and its islands.

There is now little opportunity for exploration on a large scale excepting in the Sahara, where the French are extending their investigations. The recent punitive expedition, sent by the French across the large district Mauritania in the southwestern part of the Sahara, enriched geography by a good map of that practically unknown region. The results of extended geographical work are very conspicuous in the map product of the colonial governments. The Germans have completed their fine ten-sheet map of the Togo colony, on a scale of 3.1 statute miles to an inch, which has been in preparation for ten years, and is one of the best maps ever made of a new region. The large scale maps of German East and Southwest Africa, now considerably advanced, are also among the best products of the kind and give an accurate and detailed idea of the regions they represent.

Detailed surveys in most of the colonies are rendering useless the maps of ten years ago. The German Colonial Atlas, printed in 1897, is out of date and is being reproduced to include the enormous amount of new data. The colored map sheets which the French Colonial Office is issuing of its colonies are among the best maps of recently explored parts of the world. All the colonial governments, excepting Portugal and Spain, are engaged in this great work of producing good maps of Africa. The result is that it is now possible to produce good economic maps showing climatic and topographic variations, the distribution of great forests, swamps, plains, highlands, mineral and other export products, the extent of navigation, etc.

From 100 to 150 new map sheets are issued every year and they set forth the great progress in our knowledge of Africa. The colonial boundary surveys are now nearly completed. They are of great advantage in general map making, because many astronomical positions have been fixed along these frontier lines; and as other surveys have been tied to them, a satisfactory degree of accuracy is obtained in general map work.

Railroad development is now an important influence in adding to our knowledge of Africa. Only a few of these enterprises can be mentioned here. The Cape to Cairo line will be about 6870 miles long, and about four-fifths of the distance is now covered by rail, river and lake steam routes. The Belgian Railroad Company of the Great Lakes has completed its rail routes around the series of rapids in the upper Congo, so that there is uninterrupted steam transportation by water or land for about 2250 miles from the mouth of the river to Kalengwe Falls, the extreme limit of navigation. By the completion of the railroad between Port Herold and Blantyre, the capital of the Nyasaland Protectorate has uninterrupted steam communication with ocean vessels at Chinde in the Zambezi Delta. The upper and middle Niger are now connected with the Atlantic Ocean by one British and two French railroads. The British line from the port of Lagos is in operation to Jebba on the Niger; and while the Niger is being bridged at this point, the construction of the line east of the river is being rapidly extended towards Kano, the leading commercial centre of the Central Sudan.

A large part of the study now given to

Africa relates to the discovery of its resources and the best methods for their development. Several areas under the tropical sun have been discovered which stand so high above the sea that temperate influences prevail. White immigration is invited to these regions under restrictions which limit settlement to those who are fitted for pioneer work. These lands include a large area in British East Africa, where the elevation at Nairobi is 5450 feet above the sea, in the Kikuya country up to 6500 feet, and west of the Mau Escarpment from 6000 to nearly 8000 feet. White settlers on these high plateaus have already taken up over 1,000,000 acres, most of it in large ranches. A considerable number of German peasants and Boers are settled in the neighborhood of Mounts Kilimanjaro and Meru. The Germans also have a fine reserve for future European settlement in Ruanda, in the northwestern corner of the colony, not yet opened to immigration because government is not yet organized there. Belgian farmers, accepted by the state, are moving upon the high plateau of Katanga, in the southeast corner of the Belgian Congo, where, it is said that about 40,000,000 acres are available for white occupancy. Only picked families are desired for these pioneer farming enterprises. The immigrants must have some capital and not a little hardship must be endured in the effort to make new homes in these African wildernesses.

Within the past year the experts who have been studying the question of cotton raising in Northern Nigeria have reported that districts about five-sixths as large as our own cotton area are well adapted to produce the qualities and fiber required by the English spinning mills. Rhodesia, Nyassaland, British East Africa, Uganda, German East Africa and the Togo colony are now exporting considerable quantities of cotton of good quality. German East Africa is raising a large amount of sisal hemp, and planters are discussing the question of finding a market in the United States in competition with the henequin imported from Yucatan. Indian corn is a growing export, both from West Africa and British East Africa; the island of São Thomé and the colonies on the Gulf of Guinea are among the largest producers of cacao in the world; and rubber is just beginning to be raised in plantations, insuring the permanence of the industry. The discovery that most European vegetables can be raised successfully in the larger part of Tropical Africa is a great boon to the whites living in those regions. On the whole there is a large supply of native labor for the manifold enterprises which the colonial powers and private interests are carrying on. In some regions, however, there is said to be scarcity of labor owing to the fact that European enterprises have increased more rapidly than the native labor supply. This is especially the case in German East Africa.

Col. Theodore Roosevelt's hunting expedition, which returned from British East Africa in 1910, brought to the United States National Museum about 11,000 specimens of African fauna and a considerable variety of flora.

All the leading colonial governments have experienced observers in the colonies who are spending years in the study of resources, climate and every influence that can affect colonial development. Conspicuous in this work is

August Chevalier, who has been engaged for several years in French West Africa, and reports, from time to time, on all phases of the large areas he examines, including locations at high altitudes which he believes will be useful as sanitariums for invalided white men.

Dr. Karl Kumm, a geographer and for some time a missionary in the Sudan, has crossed Africa from the mouth of the Niger to that of the Nile. In Wadai he determined the water parting between the Nile, Congo and Shari Rivers. South of the great northern bend of the Niger, Dr. Leo Frobenius, noted for the important ethnological results of his studies in the Congo Basin, is making archaeological researches with important results.

The name of the lake west of Victoria Nyanza, called Lake Albert Edward by Stanley, has been changed to Lake Edward, to prevent confusing it with Lake Albert, to which it is joined by the Semliki River.

**ASIA.** The Chinese government is beginning to issue sheets of the topographic surveys now in progress by the land survey bureaus at Peking and Nanking. The government is not yet selling these map sheets to the public, but a number of them have reached Europe. The surveys, conducted by trained natives, are being made on a large scale. No color but black is used and many symbols are employed for a large variety of information. All the names and explanatory texts are in Chinese characters, though Arabic figures are used for heights. China has never before presented so much detail on her maps and so accurately shown it. It is hoped ultimately to cover China proper with these surveys.

The first railroad to be built by Chinese engineers with Chinese money has been opened between Peking and Kalgan, a large city and the most important trading point northwest of Peking, along the edge of the Mongolian plain. The line is to be extended west from Kalgan along the southern edge of the Mongolian plateau, to Hokau, on the great northern bend of the Hoang River. The railroad passes through a very fertile and populous country.

The Russians have in progress surveys of the northern coast of Siberia, which when completed will give an exact idea of the outline of the entire Arctic coast of Asia. The results of the work for 1910 are not yet reported, but it is learned that the survey has been completed between the Lena and Kolyma Rivers and that it is far advanced between the Kolyma and Bering Strait. Many new indentations have been discovered and new proofs found of the shallow depths of the Arctic Ocean along this coast.

The government of India in 1901 gave its formal sanction to a scheme for a systematic and detailed ethnographic survey of the whole of India. The work is now in progress in each presidency or province and has been completed in the Madras Presidency, where the manners, customs and physical characters of more than 300 castes and tribes representing more than 40,000,000 people have been recorded in seven large volumes. Similar reports will come from all other parts of India and the whole will form a remarkable contribution to our knowledge of Indian peoples.

Arabia is now the largest unexplored land area of the world. Capt. F. Fraser Hunter of the Survey of India has now compiled a map

of the peninsula on a scale of 32 miles to an inch, which is the result of some years of diligent research and is now under publication by the Indian government. It is the only map of Arabia yet compiled on so large a scale and it sheds light on hitherto obscure points in the geography of that region. One of the interesting features is that the notes of some of the old explorers have been recompiled, their astronomical observations worked out and corrected and their barometric readings reduced to correct value, so that the sheets give a more accurate idea of those parts of Arabia traversed by explorers than any earlier map. The largeness of its scale emphasizes the fact that an immense stretch of the unknown still lies in Arabia.

**AUSTRALASIA.** A commission has completed a detailed survey of the proposed railroad to connect Port Augusta, South Australia, with Coolgardie, Western Australia, and thus complete the east-west transcontinental line. The distance to be covered is 1063 miles. The schema is declared to be a sound, financial project, and the building of the road is not likely to be delayed. It will bring the eastern states of the Commonwealth two or three days nearer to London.

The German-Dutch boundary parties in New Guinea, who have been surveying the boundary between their possessions along the 141st meridian, were prevented by hostile natives from crossing the island from the north. They therefore ascended the Kaiserin Augusta River to strike the boundary line further south than it had been possible to advance by the direct route. By means of a Dutch gunboat, a river steamer and smaller craft they made a most successful ascent, reaching the 141st meridian some sixty miles north of the British frontier and then continued their survey to the southern end of the boundary. This ascent of the Kaiserin Augusta River marks an important advance into the hitherto unknown interior of New Guinea.

An expedition was undertaken in 1907-08, by the Danish explorer, Frits v. Holm, to Sianfu, capital of Shensi province, China, in order to try to obtain the Nestorian Monument (Chinese: Chingchiaopei) for civilization. Results of the exploration were published in 1910.

The Nestorian Tablet was erected in 781 by Syrian missionaries, and their Chinese converts, after the successful introduction of Christian Nestorianism into the Celestial Empire by Olupun, who arrived in Sianfu in 635. It is likely, however, that the Nestorian missionaries started work in China a century earlier.

The marvelous preservation of the inscription in Chinese and Syriac proves that it was buried for centuries before, it was accidentally excavated by laborers in 1625. In 1628 the Portuguese Jesuit Smedo visited the monument and brought to Europe prints of the inscription, which counts over 2000 Chinese characters, besides the Syriac writing.

The Dutch scholar Kircher was the first to publish a translation; but the best translation was made last century by the American missionary Dr. A. Wylie.

Mr. Holm set out from Tienstin in May, 1907, and arrived in due course in Sianfu, where he made a secret contract with stone-cutters for the execution of a perfect monolith replica of the original monument. After great difficulties

the replica was transported 356 miles eastward to Chengchow railroad station on a special cart, the transportation taking three months. The replica, from which plaster casts may now be taken, is temporarily exhibited in the Metropolitan Museum of Art, New York.

On Oct. 2, 1907, the original tablet was removed to Sianfu proper, into the Peilin ("Forest of Tables"), by the Sianfu mandarins.

**AMERICA.** The vast expansion of grain raising in the prairie lands of Canada has induced the Dominion government to issue a map in three sheets, showing the acreage in wheat, oats, barley and flax, in each township of Manitoba, Saskatchewan, and Alberta, in 1909. The map for 1910 will soon be issued, and new editions will be published every year.

The Transandean railroad, opened for traffic between Buenos Ayres and Valparaiso on May 25, 1910, follows the very route across the Andes that every traveler has trodden for generations, though six other surveys were made to find, if possible, a better way across the mountains. The saving in distance between the two capitals, as compared with the sea route around Cape Horn, is 2700 miles. The influence of the road will be far-reaching. It is already stimulating the completion of Chile's great meridional line, between Puerto Montt and Pisagua, 1550 miles, which, it is expected, will be completed by 1914. Meanwhile the railroad from Arica, over the Andes to La Paz, Bolivia, is rapidly building and upon the completion of these two enterprises there will be rail connections via Santiago all the way between the Peruvian ports, the mining centres of southern Peru and La Paz, across the continent to Buenos Ayres.

Geographers have long known of Dr. Wilhelm Sievers' investigations of the geography and glaciation of the northern Cordillera of South America. He returned to Ecuador to renew his work in November, 1909, and has spent six months among the mountains of that country and Peru, collecting a large amount of new material and considerable of it in virgin territory. Among his geographical discoveries is the fact that the ultimate source of the Marañon-Amazon is to be found on the snow mountain San Lorenzo, about 10° 25' S.; 36° 37' W.

**EXPORTS AND IMPORTS.** See UNITED STATES and under different countries.

**EXPOSITIONS.** Since 1906 there have been held in the United States two important expositions, one at Jamestown, Va., in 1907, and one at Seattle, Wash., known as the Alaska-Yukon-Pacific Exposition, in 1909. Of comparatively minor importance, however, were the two expositions held in the United States during 1910. The first of these was the Ohio Valley Exposition, held in Cincinnati, Ohio, from August 29 to September 24; and the other, the Appalachian Exposition, held in Knoxville, Tenn., from September 12 to October 12. The exploitation and development of the resources of the territories indicated by their names were the chief object of these expositions, although the topic of waterway improvement was considered at the former, and the protection of forests and watersheds at the latter.

During the year the celebration of the completion of the Panama Canal by an exposition to be held in 1915, and the claims of New Orleans, La., and San Francisco, Cal., as desirable places, were agitated. In New Orleans, on

April 6, 1910, a World's Panama Exposition was organized, and a bond issue of \$6,500,000 authorized by the State, which amount, together with bonds issued by New Orleans and popular subscription, makes available a capital of \$10,000,000. Equally persistent efforts were made in the West to secure the exposition for San Francisco, and a fund of \$17,500,000 was raised by a State bond issue of \$5,000,000, a pledge of an equal amount by the city of San Francisco, and a popular subscription of \$7,500,000. An organization was effected in San Francisco with the name of the Panama-Pacific International Exposition. The citizens of San Diego, Cal., organized a Panama California Exposition to be held in that city in 1915, and upwards of \$2,000,000 was pledged for that purpose. The press of the city of Washington presented the claims of the capital city for the celebration of the completion of the canal, and this proposition received the unofficial endorsement of Baltimore.

An organization to celebrate in 1913 the one hundredth anniversary of Commodore Perry's victory on Lake Erie was formed. Commissioners from Pennsylvania, Michigan, Illinois, and Wisconsin were authorized by the legislatures of those States, and in addition to an exposition to be held at Put-in-Bay from July 4 to September 10, 1913, a national memorial is proposed for Commodore Perry and those American seamen who perished in the battle, the remains of whom still lie in unmarked graves on Put-in-Bay Island.

**BRUSSELS EXPOSITION.** The most important exposition of the year was the Brussels Universal and International Exposition, which was held from April to November. A site covering more than 200 acres was selected on the west side of Brussels not far from the Bois de la Cambre, near the new quarter of the Avenue Louise where the picturesque palaces for the installation of the exhibitions were grouped. As is usual many of the buildings were copies of historic structures; thus the official pavilion of Antwerp was the house of Rubens; Ghent revived its ancient Guild Hall of the fourteenth century; while the Spanish pavilion was a representation of the Alhambra palace at Grenada with its famous Court of Lions. The exhibition was planned to display exhibits broadly included in artistic, scientific, industrial, commercial, and colonial sections. These were classified in 21 groups including 128 classes, and an additional group devoted to Congresses and Conferences. The Exposition was formally opened by King Albert on April 23, and continued until November 14. A severe fire on August 14 destroyed the entire Belgian and British sections, including many exhibits that can never be replaced. There were 107 exhibitors attributed to the United States, and among these the Jury of Awards granted 18 grand prizes, 4 diplomas of honor, 36 gold, 33 silver, and 4 bronze medals and 4 honorable mentions.

**ARGENTINA.** The one hundredth anniversary of the independence of Argentina was celebrated with a series of five expositions held in Buenos Ayres, and devoted respectively to Agriculture, Art, Hygiene, Industry and Transportation. Of these the ones on Industry and Transportation presented exhibits that served to illustrate the progress made during the century in Argentina. The Art exhibition showed the best works produced by Latin countries, while the exhibits

devoted to Agriculture were international in character, coming from various countries, including the United States, from where an official exhibit was sent. These expositions were opened in May and continued until November. The Infanta Isabel from Spain and President Montt from Chile, as well as special ambassadors from several countries, participated in the ceremonies that occurred on May 25, the actual anniversary of the independence. Also several international congresses convened in Buenos Ayres during this period.

**ITALY.** The fiftieth anniversary of the proclamation of the Kingdom of Italy will be celebrated during 1911 by two international expositions: one in Rome to be devoted to History, Archaeology, and Art, to be held from February to October, and one in Turin to be devoted to Industry and Labor, to be held from April to November.

**FAGUET, ÉMILE.** See **FRENCH LITERATURE. FAILURES.** See **FINANCIAL REVIEW.**

**FALKLAND ISLANDS.** A group of islands in the south Atlantic, constituting a British crown colony. Area, 6500 square miles. Area of South Georgia, a dependency, 1000 square miles. Population (estimated 1909), exclusive of the South Georgia whaling settlement, 2323. Births (1909), 54; deaths, 20. Number of children receiving instruction, 428. Capital, Stanley, (800 inhabitants), on East Falkland. The chief industry is sheep-farming; pasturage, 2,325,154 acres. Number of sheep in 1909, 715,651; in 1908, 688,705. Imports (1909), £98,862 (Great Britain, £89,566); exports, £216,514 (Great Britain, £180,235). Chief exports in 1909: wool, £135,818; whale oil, £45,500; sheepskins, £16,071; tallow, £11,483; sealskins, £1070; hides, £991. Tonnage entered (1909), 160,262 (149,296 British); cleared, 150,772 (British, 144,538). Revenue and expenditure in 1909, £27,409 and £19,913 respectively (of which ordinary, £17,609 and £16,386), as against £23,874 (ordinary, £17,775) and £20,369 (ordinary, £15,685) in 1908. Governor (1910), William Lamond Allardyce. Besides South Georgia, other dependencies are the South Shetlands, the South Orkneys, the Sandwich group, and Graham's Land.

**FEDERAL APPROPRIATIONS.** See **UNITED STATES.**

**FEDERAL CIVIL SERVICE.** See **CIVIL SERVICE.**

**FEDERAL COUNCIL OF CHURCHES OF CHRIST IN AMERICA.** An organization formed as an outgrowth of the inter-church conference held in New York City in 1905, when a definite plan was proposed looking to the organization of a Federal Council of the Churches of Christ in America. During 1906-08 this plan was presented to and approved by 32 denominational bodies. In 1908 the first meeting of the Federal Council was held in Philadelphia. Its organization was at that time

completed, officers were elected and a working plan was agreed upon. The Council is composed of 400 officially appointed representatives from 32 denominations which have 100,000 ministers and 16,000,000 members. The objects of the Council are: first, to express the fellowship and catholic unity of the Christian church; second, to bring the Christian bodies of America into united service; third, to encourage devotional fellowship and mutual counsel concerning the spiritual life and religious activity of the churches; fourth, to secure a larger combined influence of the churches of Christ in all matters affecting the moral and social conditions of people so as to promote the application of the law of Christ in every relation of human life; fifth, to assist in the organization of local branches of the Council and to promote its aims in their committees.

During 1910 the Council labored for the achievement of a plan of coöperative advance in home missions. Upon the basis of an investigation of religious conditions in Colorado, a report was formulated by a joint committee composed of the committee on Home Missions of the Federal Council and a special committee appointed by the Home Mission Council. These recommendations were adopted by boards aiding over 5000 of the 6066 listed missionaries west of the Mississippi River. The work of the Commission on the Church and Social Service was of special importance during 1910. The Council issued a call entitled "The Church's Appeal in Behalf of Labor" and a report concerning the industrial situation at South Bethlehem, Pa. Progress was made in State federation work. A working programme providing practical methods of coöperation, and substituting comity for rivalry, has received such wide official sanction that the danger of unhappy divisions and waste of spiritual energy has been decreased.

The denominations embraced in the federation are the following:

Baptist Church (North), Free Baptist Church, Negro Baptist Church, Christian Connection, Congregational Church, Disciples of Christ, Evangelical Association, Evangelical Synod, Friends, Evangelical Lutheran Church, General Synod, Methodist Episcopal Church, Methodist Episcopal Church (South), Primitive Methodist Church, Colored Methodist Episcopal Church of America, Methodist Protestant Church, African Methodist Episcopal Church, African Methodist Episcopal Zion Church, Menonite Church, Moravian Church, Presbyterian Church in the U. S. A., Cumberland Presbyterian Church, Welsh Presbyterian Church, Reformed Presbyterian Church, United Presbyterian Church, Protestant Episcopal Church, Reformed Church in America, Reformed Church in the U. S. A., Reformed Episcopal Church, Seventh Day Baptist Churches, United Brethren in Christ, United Evangelical Church.

The officers in 1910 were as follows: President, Bishop E. R. Hendrix; Corresponding Secretary, Rev. E. B. Sanford, D.D.; Chairman of the Business Committee, Rev. Howard B. Grose, D.D.

**FEDERAL EXPENSES.** See **UNITED STATES.**

**FEDERAL JUDICIARY.** See **UNITED STATES.**

**FEDERATED MALAY STATES, THE.** Five states occupying a large part of the Malay Peninsula; a British protectorate.

**AREA AND POPULATION.** The five states, with their area and population in 1901, are as follows: Perak, 6580 square miles, 329,665 inhabitants; Selangor, 3200, 169,789; Negri Sembilan, 2600, 96,028; Pahang, 14,000, 84,113; Trengganu, 4500; 115,000. Total area, 30,880 square miles; population, 793,595 (both necessarily approximate). Estimated population in 1909 (exclusive of Trengganu), 966,000. None of the following statistics applies to Trengganu. Largest town, Kuala Lumpur (45,000 inhabitants), in Selangor. Schools (1908), 331, with 20,916 pupils (282 Malay vernacular, with 15,621). Kuala Lumpur has a very complete Institute for Medical Research.

**PRODUCTION.** The principal agricultural productions are rubber, rice, coconuts, coffee, sugar, tapioca, pepper, gambier, and nipa palms. Area planted to rubber at end of 1908, 180,635 acres; number of trees estimated at over 26,000,000. Area of rice fields irrigated by the Krian irrigation works in Perak, 70,000 acres. Length of irrigation canal, 21 miles; of branches, 16½; of distributory canals, 188½. The forests yield timber, gutta percha, oils, resins, canes, and fruits. Timber yield (1908), 279,016 tons; firewood for the mines, 400,000 tons. Gross revenue of the Forest Department, £65,410. Tin output (1908), 50,837 tons, valued at £6,654,017; gold, 14,887 ounces (13,653 from Pahang), as against 15,353 (14,286 from Pahang) in 1907. Lead, iron, copper, bismuth, mercury, arsenic, manganese, plumbago, silver, and zinc are found.

**COMMERCE AND FINANCE.** Imports and exports (exclusive of specie and bullion) and revenue and expenditure for three years are given in Straits Settlements dollars (1 dollar = 56.7758½ cents) below:

	1907	1908	1909
Imports .....	56,867,472	51,343,592	46,194,598 a
Exports .....	82,254,433	66,421,978	76,273,438 b
Revenue .....	28,793,750	24,623,325	25,246,863 c
Expenditure .....	20,224,762	25,854,573	23,633,851 d

(a) Live animals, foods, drinks, and narcotics, 29,361,693 dollars; raw materials, 3,827,344; manufactured articles, 10,899,451; sundries, 127,336; bullion and specie, 1,978,744.

(b) Tin and tin ore, 54,894,224 dollars; rubber 14,455,982; sugar, 848,770; copra, 726,884; gold bullion, 516,222; rice, 480,951; paddy, 387,062.

(c) Customs, 11,259,326 dollars; railways, 5,377,409; posts and telegraphs, 556,688; forest revenue, 487,133; licenses and excise, 3,137,153; land revenue, 1,312,238; land sales, 284,146.

(d) Personal emoluments, 5,183,243 dollars; other charges (establishment), 3,846,901; railways, 7,469,342; public works, 6,015,090.

Vessels entered (1909), exclusive of native craft, 4674, of 1,610,777 tons.

**COMMUNICATIONS.** Total railways open for traffic at end of 1909, 469 miles. Length of telegraph and telephone lines (end of 1909), 1437 miles; wires, 4311. Post-offices, 61.

**GOVERNMENT.** Each native state is represented in the federal council (constituted in 1909), which deals with matters common to the states. The rubber and tin interests have special representation. The chiefs preside over local affairs. Sir John Anderson (the governor of the Straits Settlements) is high commissioner. Resident-general (1910), Sir William Thomas Taylor (R. G. Watson, acting).

Trengganu, one of the states ceded by Siam to Great Britain (March 10, 1909), joined the Federated Malay States February 18, 1910. It

had never formally acknowledged the suzerainty of Siam.

**FENCING.** The seventeenth annual inter-collegiate tournament was won by the United States Naval Academy. The United States Military Academy finished second and the University of Pennsylvania third. The individual champion was Harry F. Wendel of Pennsylvania. In dual matches the Naval Academy defeated Princeton, Columbia, Pennsylvania and Yale. West Point defeated Pennsylvania, Princeton, Columbia and Cornell. Pennsylvania defeated Princeton, Cornell, Yale, Cincinnati and the University of Chicago. In the championships held by the Amateur Fencers' League, the foils were won by G. K. Bainbridge of the New York Athletic Club, the dueling swords by A. Delapore of the Fencers' Club of New York and the sabres by Joseph I. Shaw, also of the Fencers' Club. The New York Athletic Club won the contest for the Saltus medal and the Fencers' Club of New York carried off the Manrique Cup. The championship of the United States Army at broadswords went to Corporal J. D. Lohmann of the 115th Company of the Coast Artillery.

**FERTILIZERS. EXTENSION OF USE.** Exhaustion of the natural fertility of soils and the steady introduction of more intensive methods of agriculture are resulting in a constant extension of the use of fertilizers. Even in more recently settled regions the use of fertilizers is rapidly extending. In Australia, for example, the consumption of fertilizers increased from 12,500 tons in 1898 to 87,000 tons in 1910. In the United States their use is rapidly extending to regions where they were never used before and increasing in the older portions of the country. Fertilizers are, however, being more intelligently used than ever before.

A realization of the importance of conserving the natural supplies of fertilizing materials has led Germany recently to take additional precautions to protect her potash deposits and the United States to guard her phosphate deposits from wasteful exploitation and export. The Chilean nitrate deposits are, however, still being wastefully mined.

**CHILEAN NITRATE.** Following the dissolution of the Chilean nitrate syndicate in 1909 many new nitrate works (several controlled by American interests) were opened, prices fell, and the consumption of nitrate greatly increased, particularly in the United States. A United States Consular report states that 3,942,648 tons of nitrate were mined in Chile during the first nine months of 1910, as against 3,200,039 tons during a like period in 1909. The exports for the first nine months of 1910 were 3,092,506 tons, of 1909 2,847,564 tons. The world's consumption for the period was 4,399,698 tons in 1910 and 3,612,020 in 1909. The consumption of nitrate in the United States increased from 120,618 tons in 1907 to 458,081 tons in 1909. The price of nitrate is now so low that nitrogen in this most valuable form for fertilizing purposes can be bought at a lower price than in the less avail-

able forms of blood, tankage, and the like. Despite low prices and wasteful methods of handling, the Chilean nitrate industry appears to be prosperous and the deposits seem able to supply the world with nitrate for many years to come. Considerable nitrate deposits in San Bernardino, California, similar to those of Chile, were reported upon during the year.

**SULPHATE OF AMMONIA.** The production of sulphate of ammonia increased from 985,000 tons in 1908 to 1,059,839 tons in 1909. The United States produced 106,260 tons in 1909 as against 87,000 tons in 1908, and consumed 149,192 tons in 1909 as against 121,000 in 1908. These figures indicate that steps are being taken to reduce the waste of this valuable by-product of the manufacture of gas and coke.

**CALCIUM CYANAMIDE.** The manufacture of nitrogen compounds from the air by electrical processes was extended during the year and new factories were established in Europe and Japan. The first shipment (26 tons) of calcium cyanamide was made Dec. 14, 1909, from the American works at Niagara Falls, Ontario. These works are said to have a capacity of 40,000 tons per year. The product is sold only to fertilizer manufacturers. The value of this material as well as of the basic lime nitrate prepared by the Birkeland and Eyde process is well established and their use for fertilizing purposes is extending. A new process of fixing atmospheric nitrogen, using aluminum carbide or a mixture of clay and charcoal heated in an electric furnace, which it is claimed is cheaper and simpler than processes now in use, was announced during the year.

**POTASH—THE GERMAN INDUSTRY.** There were unconfirmed reports during the year of the discovery of potash deposits in Florida, China, and elsewhere, and important new mines were developed in Austria, but the bulk of the potash supply of the world continues to be drawn from the potash mines of Germany. The German potash syndicate which controls the output of these mines and the prices of the salts was dissolved in 1909. The syndicate was almost immediately renewed, but before this was done certain American interests made contracts with some of the mines for large deliveries of potash salts at greatly reduced prices, not, however, to be sold directly to farmers, but to manufacturers of fertilizers. After the renewal of the syndicate a law was enacted throwing additional restrictions around the mining and export of potash salts, and in a measure, it is claimed, invalidating the American contracts. The Secretary of State has been appealed to to intervene in behalf of the American interests, but the outcome is still uncertain and it remains to be seen whether the price of potash to the ultimate consumer will be materially affected.

Germany mines about 6,600,000 tons and exports about \$35,000,000 worth of potash salts annually. Since the mines are not inexhaustible it is obviously good national policy to conserve this great natural resource.

The amount of pure potash used for agricultural purposes increased from about 297,000 tons in 1901 to 646,600 tons in 1909, the largest consumers in the latter year being Germany, 336,376 tons, and the United States, 162,376 tons.

Efforts were made during the year to exploit other sources of potash, such as ground lava (phonolite) and similar substances, but the potash in these substances was shown to be in

such insoluble form (silicate) that they are of little value as compared with potash salts.

**PHOSPHATES.** The exploitation of new phosphate deposits was actively continued during 1910. The phosphate fields of the Western United States (in Idaho, Utah, and Wyoming) were more fully explored and examined by the U. S. Geological Survey and Bureau of Soils. The area of phosphate lands now withheld from public entry is 2,551,399 acres and the estimated tonnage of available high-grade (70 per cent.) phosphate in the area examined is 266,950,000 long tons. There is in addition a large amount of intermediate and low-grade phosphate. On account of the inaccessibility of the deposits only a small amount of the phosphates is mined, and this is sent to California for the manufacture of superphosphates. The world's production of phosphates was 5,138,600 tons in 1909 as compared with 5,596,289 tons in 1908. Of these amounts the United States consumed 2,214,600 tons in 1909 and 2,444,187 tons in 1908. Improved processes for the conversion of raw and low-grade phosphates into efficient phosphatic fertilizers were introduced during the year.

**THE USE OF LIME.** There was also a marked revival of interest in the use of lime as a soil improver, particularly as regards the general applicability of the practice of liming and the most economical and efficient forms of lime to use. The experiments reported leave no doubt of the wide need of liming and indicate that ground limestone and burnt lime are, as a rule, about equally effective when used at rates supplying equivalent amounts of actual lime (100 of pure limestone to 56 of pure lime). That form of lime should be chosen which gives the largest amount of actual lime in the finest state of division at the lowest cost. Boron, like manganese, in small amounts was shown to have a certain value as a fertilizer or stimulant, probably through catalytic action.

**FIGUERAS-CHIQUEZ, JOSÉ MARÍA.** A Porto Rican jurist, died December 2, 1910. He was born in San Juan, Porto Rico, in 1851 and was educated in a Jesuit college in Porto Rico and in the University of Santiago de Galicia in Spain. He became a licentiate in civil and canonical law at Madrid in 1879. From this year until 1892 he practiced law in San Juan, Porto Rico. From 1892 to 1895 he was connected with the Audencia Territorial Syndicate de Cuba, first as secretary and later as assistant prosecuting attorney. In 1895 he became a judge of the first instance at Mayagüez. He received a military appointment to the Supreme Court of Porto Rico, retaining the position under the provisional government, and in 1900 his position was continued under presidential appointment.

**FIJI ISLANDS.** A group of islands in the South Pacific; a British crown colony. Area, including 225 small islands, 7435 square miles. Largest islands: Viti Levu, 4112; Vanua Levu, 2432. Population (1901), 120,124 (Europeans,

2479; Fijians, 94,397); 1908 estimate, 130,091. European births in 1908, 70; deaths, 49; Fijian, 3327 and 3242. Suva, the capital (on Viti Levu), had (1906) 1121 European inhabitants. There are government and mission schools. In 1908, 4037 acres were under bananas; 29,036 under coconuts; 48,052 under sugar cane; 1191, corn; 4800, rice; 211, yams; 200, tea; 238, tobacco; 79, peanuts; 13, pineapples. There were 4950 horses, 36,385 cattle, 2971 sheep, 19,446 goats. Almost the entire trade is with British possessions.

The following table gives statistics for four years:

	Imports	Exports	Revenue	Expenditure
1909 ....	£636,250	£947,136	£177,909	£187,684
1908 ....	662,654	878,394	178,015	197,798
1907 ....	643,007	881,364	179,802	156,811
1906 ....	609,496	603,410	185,424	149,374

Total tonnage entered and cleared (1908), 478,933. Public debt (1909), £114,115.

The governor (1910, Sir Everard F. im Thurm) is high commissioner for the Western Pacific. Local affairs are in the hands of native chiefs, subject to approval by the governor.

**FINANCE.** See paragraphs on the subject in articles on countries and on States of the United States.

**FINANCE, RAILWAY.** See RAILWAYS.

**FINANCIAL REVIEW.** This article includes, besides a general statement of financial and business tendencies of the year in the United States, England and Germany, special paragraphs on *Bank Clearings*; *Stocks and Bonds*, including stock exchange transactions, important dividend changes, and new issues; *Building*; and *Commercial Failures*. The *YEAR BOOK* includes also articles on *BANKS AND BANKING*; *CENTRAL BANK*; *CURRENCY*; *NATIONAL BANKS*; *STATE BANKS*; *LOAN AND TRUST COMPANIES*; *SAVINGS BANKS*; *POSTAL SAVINGS BANKS*; *NATIONAL MONETARY COMMISSION*; *PRICES*; *TARIFF*; and *TRUSTS*. All of these articles supplement the present article and should be consulted for special phases of the year's financial and industrial history. See also separate articles on *industries and crops*, *IRON AND STEEL*; *COPPER*; *COTTON*; *SUGAR*; *GOLD*; *SILVER*, etc.; paragraphs on *Commerce* in the articles on foreign countries and the United States; *RAILWAYS*; *AGRICULTURE*, etc.

**BUSINESS CONDITIONS. RETRENCHMENT.** The most conspicuous fact regarding the financial history of the year 1910 was the failure of business to realize the optimistic promises of the closing months of 1909. It was a year of disquietude, uncertainty and unusual business caution. Following the panic of 1907 a very marked depression continued until about the middle of 1908; then began a very remarkable industrial recovery which continued through the year of 1909 and even into the earlier weeks of 1910. The past year is perhaps best viewed as one of readjustment and retrenchment, following a year and a half of too rapid growth. It was a year of some new maximum records, but on the whole a year of business contrasts. While it was notable for the largest bank deposits and loans in our history, for bank clearings exceeded only in 1909, for the greatest volume of foreign trade in any year, and for many new

records in agricultural production and even in manufacturing output, it was also notable for a greater number of labor disturbances than in any year since 1903 and for the great number of mills in cotton, wool, iron and steel manufacturing which were either closed or running on part time during a portion of the year. During the earlier months trade and commerce were at the highest level for the year; there was a decided decline from spring to early fall; and, although this recession continued in some respects, there was a more hopeful tone in business circles toward the close of the year; foreign trade especially revived, exports in December establishing a new maximum monthly record. The contrast in the amount of business is shown in the fact that the average daily bank clearings (q. v. below) were \$553,000,000 in the first quarter of the year; \$414,000,000 in the second quarter; and \$475,000,000 in December. They fell from a total of \$17,000,000,000 for January to \$11,300,000,000 for September. Similarly pig-iron production amounted to 84,148 tons per daily average in January as compared with 61,200 tons for December. Whereas steel plants were running at 90 per cent. of full capacity at the opening of the year, they were running at 55 per cent. capacity at the close of the year. No doubt the chief cause of this decline was the falling off in the demands by the railways. The decline in railway demands was in turn due in part to the uncertainty existing throughout the latter half of the year with respect to increases in freight rates. Gross earnings of railways for the first 11 months were greater than for the corresponding months of 1909, when they were the greatest in our history; but the excess over 1909 fell from a monthly average of \$28,000,000 for the first six months to a monthly average of \$8,700,000 for the next five months. This excess over 1909 was \$31,983,000 in May, but only \$1,472,000 in November. Net earnings reflected the changing volume of business even more decidedly. In the first five months they were greater than in the same months of 1909 by an average of \$6,000,000 per month; but in October they were \$11,029,000 smaller than in October, 1909. In April the railways had proposed a general advance in rate schedules to compensate themselves for the increases they were making in the wages of their employees and other increases in the cost of operation. The government, at the instance of shippers, had intervened to prevent such an advance. Thereafter, while extensive hearings were being held in various cities to determine the rightfulness of the proposed increases, the railways practiced economy by reduced purchases of iron and steel products. The effect on the earnings of the United States Steel Corporation was noticeable. While the corporation reported net earnings \$10,000,000 greater than in 1909 and \$50,000,000 greater than in 1908, its earnings fell from \$77,788,000 for the first half-year to \$63,356,000 for the second half. Moreover its unfilled orders fell from 3,971,000 tons July 31 to 2,674,000 tons December 31. Its maximum production was reached in February, after which there was a more or less steady decline. Nevertheless pig-iron production was about 27,000,000 tons as against 25,795,000 tons, the previous high record made in 1909; and ingots and castings exceeded the 1909 record by nearly a million tons. This record of the steel business is somewhat typical

of business for the year. Although many new records were established there was a tone of uncertainty and a decline in the scale of operations as the year progressed.

**THE TARIFF AND BUSINESS.** The most important cause of the ultra conservative tone of business was the political unrest. This was due primarily to dissatisfaction with the Payne-Aldrich tariff and created the feeling that further revision of the tariff was practically certain in the immediate future. This prospect alone was sufficient to give unusual caution to the scope of business ventures, and at all events it greatly limited speculative undertakings. In connection with this should be mentioned the unusual level of commodity prices and the general feelings of discontent resulting therefrom. Prices of raw material, especially in cotton, tended to a restriction of manufacturing activity. Prices of raw cotton ranged from 19½ to 13½ cents per pound. This was the highest maximum since 1873, and the highest minimum since 1874. Cotton mills in both the north and the south were generally running on part time and at only 50 to 75 per cent. of capacity in the spring and summer. The new cotton crop favored resumption in most cases at full capacity. The high price of cotton made the value of cotton exports for the year \$530,136,000, an increase of \$68,700,000 over 1909, and far the greatest value ever exported. Somewhat similar conditions existed in the woolen trade, some foreign raw wool being re-exported early in the year; but business tended to revive on the basis of the new wool clip.

**INCREASED IMPORTS.** In spite of high prices the year was one of undoubted extravagance in expenditures, although high prices were responsible for a notable meat boycott in Ohio and neighboring States and for some recession in consumption in many lines during later months. There was an unprecedented importation of articles properly classed as luxuries and a most remarkable development of the automobile trade. The monthly imports were \$163,000,000 in March, or \$30,000,000 in excess of March, 1909; but by November had fallen to \$117,000,000, or \$4,000,000 less than the same month in 1909. The total imports were 5.4 per cent. above the preceding years. The high level of prices made this a good country to sell in and a poor country to buy in. In five out of the twelve months imports exceeded exports. This great increase in imports endangered the command of American banks over gold and was a cause of relatively high rates of interest during a considerable part of the year. Gold exportation was very large in the spring and money rates were high not only in the West and Southwest, where land speculation was extensive, but also in New York, where banks pursued a policy of avoiding speculative loans. The report of the Comptroller of the Currency showed that the average interest rate of National banks was 7.33 per cent., of State banks 7.73 per cent., and of trust companies 6.66 per cent. One result of this was that, although the amount of new securities floated in the United States was only slightly less than in the preceding year, about \$150,000,000 of American railway bonds were sold in London and Paris. The dealings of the New York Stock Exchange showed a decline of 33 per cent. in stocks and 50 per cent. in bonds, as compared with 1909. Moreover the average value of securi-

ties reached the lowest level since the panic of 1907.

**TRUST PROSECUTIONS.** Another important cause of business uncertainty was due to the great number of trust prosecutions and the consequent doubt regarding the legal status of big business. While the President stated in his annual message that "the great body of business men of this country, those who are responsible for its commercial development, now have an earnest desire to obey the laws and to square their conduct of business to its requirements and limitations," the Administration nevertheless pushed forward an unusual number of prosecutions for the violation of the anti-trust law. Among these cases were those of the Standard Oil and American Tobacco companies, which were argued before the Supreme Court early in the year and set for reargument early in 1911. On account of the great importance of these cases for the future of such combinations, business seemed to wait for the final pronouncement of the Court.

**STATISTICS.** The following are some of the important statistical facts of the financial year:

		Changes from 1909	
		Per cent.	
Corn produced.....	3,125,713,000 bu.....	12.7	inc.
Wheat produced.....	695,443,000 bu.....	5.7	dec.
Oats produced.....	1,126,765,000 bu.....	11.8	inc.
Barley produced.....	162,227,000 bu.....	4.7	dec.
Potatoes produced.....	338,811,000 bu.....	10.0	dec.
Hay produced.....	60,978,000 T.....	6.0	dec.
Tobacco produced.....	984,349,000 lbs.....	3.6	inc.
Cotton produced.....	12,000,000 bales.....	13.1	inc.
Wool clip produced.....	321,362,000 lbs.....	2.1	dec.
Sugar produced.....	1,565,000 T.....	.6	inc.

Locomotives built..	185,357.....	92.0	inc.
	4,755.....	64.0	inc.

**BANK CLEARINGS.** One of the principal indexes of the total amount of trade is the aggregate bank clearings. This aggregate for 111 principal cities of the United States in the calendar year 1910 was \$161,785,328,000; this may be compared with \$164,200,860,000 in 1909; and with \$84,582,450,000 for 114 cities in 1900. While the total was larger than in any year except 1909 some allowance should be made for the differences in price levels, especially for comparisons for years preceding 1907. The following figures giving the aggregate clearings for these cities in millions of dollars by months are suggestive of the general course of trade during the year: Jan., 16,987; Feb., 12,963; March, 14,835; April, 13,853; May, 12,995; June, 13,662; July, 13,137; Aug., 11,366; Sept., 11,188; Oct., 13,599; Nov., 13,414; Dec., 14,749. While the clearings for the month of January were the largest in American history for any one month, and while those for each of the first four months were larger than those for corresponding months in any preceding year, the aggregate clearings for the third and fourth quarters were less than in 1909 or 1906.

The total clearings at New York were \$97,274,500,000, an amount exceeded only in 1909

and 1906. The proportion of the total clearings credited to New York was smaller than in any year of the decade, due mainly to the increases shown by cities in agricultural sections; the rather noticeable decline of the later months was very largely due to a falling off in New York clearings, explained by a decided fall in stock and bond transactions. There were 60 other cities with clearings of more than \$100,000,000 for the year. Those with more than \$1,000,000,000 each were Chicago, \$13,939,689,000; Boston, \$8,299,320,162; Philadelphia, \$7,689,664,085; St. Louis, \$3,727,949,379; Kansas City, \$2,634,557,738; Pittsburgh, \$2,587,325,784; San Francisco, \$2,323,772,870; Baltimore, \$1,626,876,299; Cincinnati, \$1,151,797,050; Minneapolis, \$1,155,659,664; Cleveland, \$1,000,857,952. This last city ousted New Orleans from the thirteenth place, the Southern city being about \$13,000,000 lower.

Fourteen Canadian cities had aggregate clearings of \$6,054,298,000 in 1910. Of this amount, one-third was credited to Montreal; one-fourth to Toronto; and almost one-sixth to Winnipeg. The total was about 16 per cent. larger than for the preceding year, and 45 per cent. larger than that for 1908.

**STOCKS AND BONDS.** In general the stock market contrasted sharply with the preceding year. The buoyant upward movement of the later months of 1908 and all of 1909 was replaced by contraction, pessimistic feeling, and desultory interest on the part of the investing public. The collapse of the Columbus and Hocking Coal and Iron pool on January 19 resulted in the failure of three stock exchange houses; and on February 1 the firm of Fisk & Robinson went into bankruptcy. So great was the liquidation in January that Union Pacific stock declined 20 points; Reading, 17; United Copper, Southern Pacific, and St. Paul, 13; United States Steel and New York Central, 10. The decline in values continued until late July, though some stocks reached their low points in August and September. Thereafter there was a moderate recovery. The early decline was due in part to the President's anti-trust message of January 7 (see TRUSTS) and the activity of the Department of Justice against beef packers, the Union and Southern Pacific railways, and other combinations. These events were slightly counteracted by an extra dividend on United States Steel common. In March the Bank of England advanced its discount rate for the first time since 1878. In that month, the Standard Oil and corporation tax cases were argued before the Supreme Court; railways were threatened with strikes; the political unrest caused uncertainty; and unfavorable foreign trade conditions led to the exportation of \$36,000,000 of gold, the largest monthly exportation of that metal since 1904 and the second largest in our history. The unfavorable events were only modified in small degree by an increase in the dividend rate by the New York Central Railroad and two decisions of the Supreme Court annulling rulings of the Interstate Commerce Commission. In May foreign investments in American securities were large; and the stock market was active with declining prices. The sharp decline in June was due to the Federal injunction against higher railway rates. The downward movement ended in July with lower net earnings, general and persistent demands for higher wages, and a cut in the divi-

dend of the National Lead Company. Security prices were in general lower than at any time since the panic of 1907. At this time occurred a notable stock movement whereby a syndicate purchased Rock Island, Pearson-Farquhar, and other stocks. In the early fall shipments of currency for crop movements and political agitation were offset by gold importation and good crops. But in September the volume of dealings was the lowest in any month since 1904. Good crops, lower prices of raw materials, and the decisions of the circuit court sustaining the combination of the anthracite roads, resulted in ascending prices, in spite of pessimistic statements by Mr. James A. Hill, new anti-trust suits, and the closing of two banks in New York City.

The total transactions of the New York Stock Exchange for the year were 163,970,440 shares of stocks and \$634,746,503 par value of bonds. This was the smallest number of shares of stocks in 10 years except in 1903; and the smallest value of bonds in 10 years except in 1907. Compared with 1909 there were 23 per cent. fewer shares of stocks and 52 per cent. smaller value of bonds.

The following are the important railway dividend reductions for the year: The Pennsylvania Company reduced its dividends from 7 to 8 per cent.; St. Louis and Southwestern, from 5 to 4; Chicago and Alton passed its 2 per cent. semi-annual dividend in August. These increases were made: Canadian Pacific, 6 to 7; Chesapeake and Ohio, 4 to 5; Lehigh Valley, 6 to 10; Evansville and Terre Haute, 4 to 5; Louisville and Nashville, 6 to 7; Mobile and Ohio, 2½ to 4; St. Louis and Iron Mountain, 4 to 6; Nashville, Chattanooga and St. Louis, 5 to 6; New York Central, 5 to 6; New York, Chicago and St. Louis, 0 to 3; New York and Harlem, 0 to 1½; Reading, 4 to 6; Western Maryland, 0 to 4. According to the compilation of the *Journal of Commerce and Commercial Bulletin*, the aggregate new stocks, bonds and short term notes issued by all corporations in 1910 was equal to \$1,518,272,000. This was 10 per cent. less than in 1909, but almost 7 per cent. greater than in 1908, and 8½ per cent. greater than in 1907. Railroad and traction companies issued \$876,581,000 or \$138,625,000 less than in 1909; and industrial and other corporations issued \$641,691,000 or only 2 per cent. less than the year before. The great decrease in railroad issues was due to a decline of \$105,707,000 in bonds and \$193,083,000 in stocks, together with an increase of \$160,164,000 in notes. The railroad issues were: Bonds, \$547,649,000; stocks, \$115,981,000; notes, \$212,951,000. Industrial and miscellaneous corporations issued: Bonds, \$290,846,000; stocks, \$289,091,000; notes, \$61,753,000. The same journal reported the aggregate capital of new companies, with at least \$1,000,000,000 capital incorporated in the Eastern States, at \$1,967,617,000. This amount was exceeded in 1906, 1901 and 1900; but was 25 per cent. greater than in 1909 and 41 per cent. greater than in 1908. The aggregate capital of all new companies with more than \$100,000 capital each for these same States was \$2,869,000,000.

**BUILDING.** Expenditures in building operations, as reported to *Bradstreet's* from 114 cities, showed a total of \$838,933,000, a decrease of 4.8 per cent. compared with 1909. There was a decrease shown by every month in comparison

with the corresponding month of 1909, except March and June. Nevertheless the total was about 30 per cent. more than for the after-panic year 1908. Of the 114 cities, 60 showed gains over 1909, and 54 losses.

**FAILURES.** (a) *Commercial.* The total number of business failures for the year, as reported by *Bradstreet's*, was 11,573. This was a decrease of 2.3 per cent. compared with 1909 and of 21 per cent. compared with 1908; the number was greater than in any year since 1896. The failures in 1910 were only .72 per cent. of the 1,592,509 concerns in business in the United States, the smallest percentage ever reported by that periodical. The failures in the first quarter numbered 3302; in the second quarter, 6604; in the third quarter, 2655; and in the fourth quarter, 3027. The number for the New England States was 1285; for the Middle States, 3773, of which 2144 were in New York and 1177 in Pennsylvania; Western States, 2086; Northwestern States, 646; Southern States, 2673; Far Western States, 1088; Territories, 37. The total assets of the failing concerns were \$94,718,000; and the total liabilities \$188,399,060. The assets were 50.2 per cent. of the liabilities as compared with 49.2 per cent. in 1909, 56.9 per cent. in 1908 and 75 per cent. in 1907. A considerable number of the suspensions were due to causes growing out of the crisis of 1907 and many others were due to conditions apart from current influences. Nevertheless there were some large failures in lumber, iron and steel, jewelry, tobacco, automobiles, and some lines of textile manufacture which were more or less directly due to current conditions. The percentages of failures due to different causes were as follows: Incompetence, 26.6; inexperience, 4.4; lack of capital, 33.9; unwise credits, 1.7; failures of others, 1; extravagance, .7; neglect, 2.5; competition, 2.6; specific conditions, 14.4; speculation, 1; fraud, 11.2. Compared with immediately preceding years the lack of capital, unwise credits and failures of others were less important causes and incompetence a more important cause.

(b) *Financial.* For failures of banks and loan and trust companies, see articles on the different kinds of banks.

(c) *Canada.* The total number of failures in Canada and Newfoundland was 1465. This was a decrease of 7 per cent. from 1909, and of 14 per cent. from 1908. The total assets were \$1,022,000 and the total liabilities \$15,563,000. The latter were 22 per cent. greater than in 1909, but 12 per cent. less than in 1908. About four-fifths of all the failures and five-sixths of the liabilities were classed under individual names. The lack of capital was the cause of 46.8 per cent. of the failures; incompetence of 14.9 per cent.; fraud 9.5 per cent.; specific conditions of 18.7 per cent.

**GREAT BRITAIN.** The financial year of Great Britain was disturbed by the death of the sovereign and by two hotly contested elections. Nevertheless the year was fairly good, in some respects excellent financially. Bank clearings were the best ever known, as were also the flotation of new securities, and domestic and foreign trade. The year closed, as in the United States, with a general increase of optimism and a more buoyant tone. Yet there was in the background a feeling of caution due to world-wide social unrest, disturbed political conditions in Great Britain and the United States, prospective de-

mands for gold by Brazil, and the belief that the new flotations during the past three years were greater than the market could absorb. To these must be added the increased revenue demands of the government leading to high taxation. Governmental expenditures were already encroaching upon such emergency measures as the income tax. Taxation in general was the highest in normal times in many years, with the result that British consols came very near to the lowest point ever reached. The early months of the year were notable for a wild speculation in the stocks of rubber and oil companies which sprang into existence with mushroom rapidity. The rubber speculation based on plantations in the East Indies and the Malay Archipelago were especially wild. It was estimated at the close of the year that one-third of these rubber and oil companies would prove worthless. A notable feature of the London stock market was that their flotations of new securities were by far the greatest in amount ever put out. The total was £275,000,000, £216,000,000 for the first nine months. The total for 1909 was £182,000,000; for 1908, £192,000,000; and the maximum for the preceding 20 years was £189,400,000 issued in 1889. Of the new securities of the first nine months of 1910, £26,000,000 were issued by colonial governments and corporations; £42,000,000 by foreign railways; £22,000,000 by foreign governments and corporations; £9,000,000 by Indian and Colonial railways; £18,000,000 by rubber companies; £8,000,000 by oil companies in foreign parts of the world. Altogether £38,000,000 of the new capital issues were destined for the United States; £31,000,000 for Canada; £10,000,000 for Argentina, and £11,000,000 for Brazil.

The aggregate value of 387 stocks traded in on the London exchange was £3,709,574,000 in January; this rose slightly until April and thereafter declined more or less steadily until November, with a slight recovery in October, and a slight rise again in December to £3,647,692,000. There was thus a loss for the year of £60,000,000, or 1.6 per cent. This was in large part due to the declines in the value of American railway stocks. English railway securities were either stationary or increased in value owing to the great volume of the internal trade.

Industrially the year was marked by a great number of strikes, with especially serious interruptions of the cotton and ship building industries (see STRIKES AND LOCKOUTS). For a time the cotton trade was forced to restrict output on account of the high price of raw material. Wool also was high. But on the whole, as shown by greatly decreased unemployment and the great volume of internal and international trade, the year was good in industry and commerce. The international trade amounted to \$5,900,000,000, a gain of 10.7 per cent. over 1909 and of 4 per cent. above the maximum record of 1907. This total was \$130 per capita as compared with \$37 for the United States. Though some of the increase was due to rising prices, yet the general average of prices was lower than in 1907. Exceptions to this existed in the case of cotton and rubber, which articles caused 80 per cent. of the increase in the value of imports over 1909. The greatest increases in exports were shown by cotton goods, woolen goods, iron and steel products.

**FAILURES.** Kemp's *Commercial Gazette* gave the total number of failures in the United Kingdom in 1910 as 9054; this may be compared with

9389 in 1909; 10,196 in 1908; and 9606 in 1907. The following trades showed the greatest number of failures: building and timber, 961; wine, spirits, beer and tobacco, 527; drapery, silk and woolen, 1074; groceries and provisions, 2060; corn, cattle and seed, 453; jewelry, 403; leather and coach, 434; hardware and metal, 355; merchants, brokers and agents, 348.

**GERMANY.** Financial and industrial conditions were in general somewhat better than in 1909. Nearly all lines of trade showed rather steady improvement. The iron and steel companies had larger output than in either of the two years preceding, and most of them raised their dividends. Iron and steel exports were unusually heavy. Coal prices were lower, and profits of coal companies were reduced. All lines of textiles showed advances; the cotton industry, however, as in England and the United States, suffered from high prices of raw material, but revived in the later months. The total exports for the first ten months were larger by \$189,000,000 than in 1909 and imports were larger by \$16,500,000, total exports being 1,451,000,000 and total imports, \$1,877,000,000. On this basis the net gold imports increased nearly \$60,000,000 during the same period. The stock market at Berlin reflected the movement of the Wall Street exchange. Prices reached their lowest level in June at the time of a very serious break in American securities' prices. While an unusual amount of money was invested in American stocks and bonds as in the preceding year, there was nevertheless a growing opposition to the tendency of German capital to engage in American undertakings.

**FINLAND.** A grand duchy on the Gulf of Bothnia; a part of the Russian Empire. Capital, Helsingfors.

**AREA AND POPULATION.** Total land area, 125,784 square miles. Of the total area (144,255 square miles), 11.15 per cent. is under lakes. Population (estimate, January 1, 1908, by the Russian Central Statistical Committee), 2,968,600. Births (1907), 92,457; deaths, 53,028; still-births, 2181; marriages, 20,266; emigrants, 16,296. Helsingfors had (1907), with Sveaborg, 130,844 inhabitants; Abo, 46,637; Tampere, 43,696; Viborg, 33,175.

**EDUCATION.** A relatively high standard of education is maintained, and except along the Russian border there is very little illiteracy. Primary instruction is compulsory between the ages of seven and fifteen, and the schools are well attended. Secondary education is provided in the lyceums, realschools, and country high-schools, also well attended by both sexes. There are special schools, and a university at Helsingfors. The Russification of Finnish schools, newspapers, and societies is one of the objects of the "Imperial Legislation Law" of June 30, 1910. The Finns are Lutherans.

**PRODUCTION.** The leading crops in 1907 were, in hectolitres; oats, 7,274,518; rye, 3,887,703; barley, 1,805,730; wheat, 49,287; potatoes, 6,612,665; flax, 1026 tons; hemp, 335 tons. Live-stock (1907): 327,817 horses; 1,491,264 cattle; 904,444 sheep; 221,072 swine; 133,749 reindeer; 6279 goats. Area under crown forests (1907), 12,827,164 hectares; revenue, 9,898,316 marks; expenditure, 1,678,162 marks. Saw mills, 608; employes, 25,821; output, 3,101,415 cubic metres of timber. Output of iron ore in 1907, 33,108 metric tons; pig iron, 15,100; bar iron, 26,388. Manufactories of all kinds (1907), 9269; ag-

gregate number of workers, 135,415; aggregate value of products (exclusive of flour-mills), 513,648,026 marks.

**COMMERCE.** The trade for four years is given below in thousands of marks (1 mark=19.3 cents):

	1906	1907	1908	1909
Imports .....	313,895	379,056	363,540	387,100
Exports .....	280,114	267,237	245,044	257,100

Principal articles of special trade (in thousands of marks):

Imports	1000 mk.	Exports	1000 mk.
Cereals .....	88,800	Timber .....	133,400
Machinery .....	20,000	Paper, etc. ....	42,500
Minerals .....	18,100	Butter .....	29,400
Iron, etc. ....	17,200	Skins, etc. ....	9,200
Sugar .....	16,800	Fish .....	5,000
Coffee .....	15,800	Woolen goods...	4,800
Cotton .....	15,000	Cottons .....	4,700
Chem. prods. ....	10,800	Iron .....	2,400

Vessels entered (1909), 9126, of 2,708,089 tons; cleared, 8671, of 2,573,132.

**COMMUNICATIONS.** Length of railways in operation in January, 1910, 3559 kilometres (largely state-owned). Revenue (state railways) in 1907, 39,595,000 marks; expenditure, 33,469,000; cost to end of 1907, 346,584,000. Vessels plying the canals (1908), 45,273; receipts from canal traffic, 925,971 marks; expenditure, 545,011. Post-offices, 1954.

**FINANCE.** Finland has its own financial and customs system. The unit of value is the mark, worth 19.3 cents. The revenue and expenditure for three years are given below:

	1907	1908	1909
Revenue .....	134,882,249	160,507,038	185,053,833a
Expenditure .....	130,340,191	167,993,796	177,650,169b

(a) State enterprises, 56,261,543 marks; indirect taxes, 60,898,897; direct taxes, 6,371,849; extraordinary, 41,464,567.

(b) Communications, 44,324,630 marks; worship and instruction, 17,148,981; civil administration, 13,149,342; extraordinary, 54,889,983.

Debt, January 1, 1910, 179,704,110 marks. Savings banks (December 31, 1907), 327; depositors, 253,517; deposits, 193,439,505 marks.

**GOVERNMENT.** The Russian Czar is the grand duke of Finland. He summons and may dissolve the Diet—a unicameral body, chosen by direct proportional election, both sexes being eligible to vote. The Diet, unless dissolved, lasts for three years; it has theoretically the power to legislate in matters not affecting fundamental laws nor the organization of land and sea defense. The "Imperial Legislation Law," enacted June 30, 1910, deprives the Diet of its right to pass upon Finnish questions involving imperial interests, and includes among such questions the imposition of taxes, police direction, school management, the authorization of public meetings, and the control of the periodical press. (See below under *History*.) The governor-general (1910, Lieut.-Gen. F. A. Seyn), and the Russian secretary of state for Finland (1910, Lieut.-Gen. A. Langhoff), are the head of the executive, and are responsible to the Czar and, theoretically, to the Diet. President of the Diet in 1910, P. E. Svinhufvud.

## HISTORY

**A PLEA FOR FINLAND.** In March, 1910, the arguments on behalf of Finland against the Russian Imperial design of abrogating her constitutional rights was set forth in a meeting of leading authorities in international law, publicists and professors of jurisprudence; held at the house of Professor Westlake in London. They issued the following statement:

"(1) The rights of Finland in respect to her Constitution are not a figment of Finnish 'imagination,' but an historical reality; they do not form a 'dogma' in which the Finlanders believe without being able to offer proof, but a judicial truth scientifically demonstrated.

(2) It is not only from Sweden, under the Treaty of Fredrikshamn (Article IV), but, as was recognized by the same document (Article VI), before this treaty, from the Finlanders themselves, that Alexander I, on his solemn promise to them to respect their Fundamental Laws, took possession of Finland.

(3) When, at the Diet of Borgo, the Oath of the four Estates followed on the promises of the Czar, Finland "free as regards her internal affairs," "from henceforth placed in the rank of nations," did not enter into the Russian Empire as a conquered province, precariously endowed with temporary privileges, but as an autonomous organism, united by free agreement to a sovereign state which, on account of this agreement, is obliged to respect this autonomy.

(4) In whatever fashion authors analyze and define the tie between Finland and Russia, according to their conception of a state and their different modes of classifying institutions of public law, they are, with very few exceptions, all agreed, Russians included, on this point, that Finland has the right to demand that the Russian Empire should respect her Constitution.

(5) The introduction in Russia of a constitutional system could not modify the position of Finland.

It cannot be said, from a practical point of view, that the autonomy of Finland, arising from a difference of governmental systems, autocratic in Russia, constitutional in Finland, has no longer any reason for its existence now that absolutism has ceased in Russia. Finland, whose political education is more ancient, and whose national civilization is different from that of Russia, requires her liberty, already greater and always "inherent in her customs"; moreover, Alexander I and his successors have not merely guaranteed in perpetuity to the Finlanders their individual liberties, but in order to sustain and vivify these they have guaranteed to Finland the liberty of her people.

Again, it cannot be said, *de jure*, that after the new Russian Fundamental Laws of 1906 (Article I) Finland, instead of being a part of the Russian Empire (Finland and Russia), is only a part of the Empire of Russia; that in virtue of these same laws (Article 2), the Diet has not the right to legislate on all internal questions, but only on such of these questions as do not touch the interests of Russia—interests of which Russia is the sole judge; and that in the case of a conflict between the new Constitution of Sovereign Russia and the old Constitution of non-Sovereign Finland, it is the first which ought to prevail. The Czar, in limiting his rights as regards Russia, could not increase them as regards Finland; no one can create a

right for himself; being unable to withdraw from the Diet the right to legislate, he could not transfer from the Diet to the Duma all, or any part, of this right; no one can give to another more than he possesses.

(6) Being unable, by direct means, to withdraw either from the Diet or from the Finnish administrative organs all or any part of their powers, Russia cannot do so by indirect means through reserving to herself the right to determine the scope of this competence.

(7) If the superior interests of the Empire demand the establishment of a common procedure for dealing with certain internal affairs, it pertains to the Diet either itself to determine those affairs or to consent to the creation of a body charged with determining them."

**FINLAND'S OPPOSITION.** The Russo-Finnish Commission on the relations of Finland to the Empire had decided in December, 1909, by a vote of 65 strictly according to nationality, that Finland should be reduced to a status of provincial autonomy and should send five representatives to the Duma and one to the Council. In the elections of February, 1910, the Old Finn party, which favored compromise with Russia, lost six seats and the Agrarians and Socialists had a clear majority. According to the returns the parties in the new Diet were distributed as follows: Old Finns, 42; Young Finns, 28; Swedish People's Party, 26; Social Democrats, 86; Agrarians, 17; Christian Labor, 1. Fifteen women were elected. The Diet was opened on March 1. A Russo-Finnish bill, carrying out the principle approved by the Russo-Finnish Commission was brought into the Imperial Duma and it was also laid before the Finnish Diet. The debate on the bill in the Diet brought out much criticism on the Czar's attitude towards Finland, members characterizing it as an outrage on civilization. At the beginning of April the Diet unanimously voted it into committee for drafting a reply to the effect that the measure was unconstitutional. On account of his protests against the attempt to violate the constitution, M. Charpentier, Procurator of the Finnish Senate, was dismissed. In the Imperial Duma the Russo-Finnish bill, known as the "Imperial Legislation Law," was carried on June 30. On August 5 the Peace Congress at Stockholm unanimously passed a resolution declaring that the treaties on which Russo-Finnish relations rested recognize Finland as a nation and hoping that Russia would restore these treaty rights. On September 14, the Czar called an extraordinary session of the Finnish Diet, which was opened on September 17. The proposal laid before it was that it should conform to the new Imperial law of June 30, 1910, by electing representatives to the Russian Parliament and by declaring its opinion on two legislative proposals drafted by the Russian Council of Ministers and subsequently to be submitted to the Russian Chambers. On September 23 the Diet rejected the proposal unanimously. The Czar dissolved the Diet and appointed January 2 for the next elections. The attitude of the opponents to the measure as set forth by a member of the Diet was that acceptance of the law would mean abandonment of Finland's separate constitutional existence. While the Diet acknowledged that there were matters open to question and declared that it would coöperate toward their settlement, it did not believe that Russian Imperial interests required the suppression of Finland's in-

dependence in internal administration and legislation. Hitherto questions bearing on the common interests of the two countries, as for example their commercial relations, had been regulated by identical Russian and Finnish laws. There were no grounds for this violation of the treaties and for this suppression of Finnish liberties. The difficulty with Russia caused the resignation of four governors and in November the governor of the Viborg District was dismissed for non-compliance with Russian demands. For further details see the article on RUSSIA, paragraphs on *History*.

**FIRE ENGINES.** See FIRE PROTECTION.

**FIRE INSURANCE.** See FIRE PROTECTION and INSURANCE.

**FIRE LOSSES AND WASTE.** See FIRE PROTECTION.

**FIRE PROTECTION.** During the year the New York Fire Department definitely decided to commence putting its apparatus on an automobile basis. Contracts were let for the construction of six motor-driven hose wagons for use in the high pressure district to carry the strong, heavy hose required for use with the high pressure mains. These wagons were in the main counterparts of one successfully used for two years with the first high pressure hose company, carrying forty-five 50-foot lengths of 3-inch hose in addition to the crew of from eight to twelve men and the ordinary tools and adjuncts. They were to be capable of an extreme speed of 40 miles an hour, but this would be rarely if ever needed. At the same time the New York Fire Department prepared specifications for an electrically driven motor extension ladder truck where a gasoline engine was connected with a dynamo from which current was derived for a motor at each wheel, the steering and control of the motor being done by the driver, while a tillerman over the rear wheels assisted in turning sharp corners. A contract was also let for building a second-size steam fire engine with an automobile chassis in place of the front wheels, poles, etc., used with horses. A few months previously an engine had been rebuilt in this way largely as an experiment and its success warranted the New York Fire Department in making a contract for the transformation of one of its standard fire engines. This in no way interfered with the steam engine and its pumping mechanism, but merely substitutes gasoline motors for the horse, giving a six wheeled vehicle in place of one with four wheels. As further demonstrating the tendency of the New York Fire Department to install motor apparatus it may be said that towards the end of the year several contracts were awarded for combination engines for use in the suburbs. In these engines the driving mechanism could be uncoupled from the motors and the pumping machinery thrown into gear. The specifications of the New York Fire Department were very rigorous, but so many of these machines were in use during the year that a number of manufacturers were willing to bid on their construction.

**HIGH PRESSURE.** During the year the high pressure system was extended on the borders of the original high pressure district. Late in December it was announced by Fire Commissioner Waldo that a fire college would be started at fire headquarters to give practical instruction to various members of the department both officers and firemen. It was thought in this way that the already high standard of efficiency of

the New York Fire Department would be materially raised, especially on its technical side.

In many other places than New York the introduction of motor apparatus has taken place and new automobile hose and combination wagons are to be found not only in cities, but in suburban towns and villages, many efficient machines being constructed and practically all the large makers of fire apparatus were actually turning out gasoline machines. The age of the horse had passed so far as fire apparatus was concerned and greater economy and speed of operation were everywhere secured.

**A DIRECT FIRE ALARM SYSTEM.** Another interesting development among the many progressive ideas introduced into the New York Fire Department during the year was the proposed reorganization of the fire alarm system which for many years has been obsolete and of low efficiency, though in actual operation worked with considerable success and skill by the telegraph bureau. A new system being required, J. C. Rennard, the electrical engineer of the department, proposed a direct circuit system with paper insulated cables in which a pair of conductors would run from each separate box to the central station which it was proposed to erect in one of the city parks where it would be absolutely safe from any conflagration risk. Such a system would require only the simplest form of alarm boxes and would be more economical to install and maintain than the best non-interfering successive circuit systems which were thought would be less efficient.

These various improvements in New York concerned fire departments throughout the United States, as the innovations introduced or projected were all most radical.

**INSURANCE INVESTIGATION.** During the year a committee from the legislature of the State of New York, appointed to investigate the various conditions alleged as to corruption and other attempts to influence legislation, investigated the question of fire insurance. A number of hearings were held at which much testimony was presented and data and statistics in the records of fire rates and similar technical details were recorded in addition to much information relating to the business practices of the insurance companies, their exchanges and agents. See NEW YORK.

**FIRE WASTE IN THE UNITED STATES.** During the year many attempts were made to make effective the lessons of the enormous fire losses in the United States. The United States Geological Survey published Bulletin 418: *The Fire Tax and Waste of Structural Materials in the United States*, by Herbert M. Wilson and John L. Cochrane, in which were compiled statistics showing the unenviable record of the United States, as compared with Europe. It was here pointed out that the annual loss by fire in the United States is \$456,486,151, of which amount \$215,084,700 represents the total loss by fire, while \$241,401,442 represents the annual expense of fire protection, included in this being the excess premiums over insurance paid, annual expense of water works chargeable to fire service, annual expense of fire departments and annual expense of private fire protection. Were American buildings as nearly fire-proof as those of Europe, this amount would be reduced to \$90,000,000 and an annual saving of money amounting to \$366,000,000 or nearly enough to build a Panama Canal would be effected.

**FIRE LOSSES IN THE UNITED STATES AND CANADA.** The losses by fire in the United States and Canada in the year 1910 showed a marked increase over the figures of the preceding year. The statistics of the *New York Journal of Commerce and Commercial Bulletin* gave for 1910 an aggregate loss of \$234,470,650, as compared with \$203,649,150 in 1909. The increase in the total losses during 1910 was in large manner caused by the protracted drought during the summer as during the first half of 1910 the aggregate losses were less than during the same period of 1909. The forest fires during the late summer months were productive of large fire waste, but in addition there was a continued and widespread destruction of property which can not be explained by the extraordinary climatic conditions of the year. The following table gives the losses by months during 1908, 1909 and 1910:

	1908	1909	1910
January .....	\$29,582,000	\$22,735,000	\$15,175,400
February .....	18,489,700	16,131,000	15,489,350
March .....	16,728,300	13,795,400	18,465,550
April .....	26,009,000	19,345,200	18,071,800
May .....	15,181,150	17,360,400	18,823,200
June .....	19,512,000	14,435,900	13,183,600
July .....	15,323,750	15,830,900	26,847,900
August .....	23,123,000	16,423,000	21,570,550
September .....	21,431,400	15,043,000	11,700,000
October .....	22,722,850	17,765,200	37,188,300
November .....	15,834,350	14,808,550	16,407,000
December .....	14,629,750	19,975,500	21,528,000
Total .....	\$238,562,250	\$203,649,150	\$224,470,650

There were during the year 1910 no less than 3225 fires where the loss in each instance reached or exceeded \$10,000. While this is somewhat smaller than the number of fires over that sum reported during 1910, or in fact any of the four preceding years, it is interesting to note that the fires of larger destructiveness have steadily increased in number, probably due in a measure to the concentration of values in an individual risk.

The fire losses in the United States and Canada during the thirty-four years aggregate \$4,947,008,175, ending with 1910, or an annual average of \$145,500,240. There has been a steady increase in the country's fire waste at a ratio far in excess of the normal ratio of increase in the country's wealth:

1910.....	\$234,470,650	1904.....	252,554,050
1909.....	203,649,200	1903.....	156,195,700
1908.....	238,562,250	1902.....	149,260,850
1907.....	215,671,250	1901.....	164,347,450
1906.....	459,710,000	1900.....	163,362,250
1905.....	176,198,800		

There were no large conflagrations during the year 1910 unless forest fires in the northwest may be considered as one continuous fire. A general conflagration at Campbellton, N. B., in July, destroyed property valued at \$3,500,000. There were during the year some 36 fires which caused a property loss of \$500,000 or over. These fires were as follows:

Location and description.	Estl. loss.
N. Y. City, United States Army Depot....	\$ 500,000
Pueblo, Colo., steel works pattern shop...	600,000
Winlock, Wash., business portion of town.	650,000
Hambleton, W. Va., tannery.....	800,000
Philadelphia, Pa., oil warehouse, mantel factory and other.....	600,000
Omaha, Neb., flour mill and elevator.....	600,000

Beaver Falls, Pa., steel works and type-writer factory.....	500,000
St. Louis, Mo., brewery plant.....	530,000
Ford City, Pa., plate glass works.....	1,500,000
Kansas City, Kan., soap factory and other .....	1,500,000
Elkhart, Ind., band instrument factory..	500,000
Bluff Point, N. Y., summer hotel.....	500,000
Minneapolis, Minn., implement warehouse and other.....	1,000,000
Paterson, N. J., furniture store and other.	502,000
Arnprior, Ont., lumber yards.....	1,000,000
Marmette, Wis., timber lands and saw-mills .....	1,200,000
Campbellton, N. B., conflagration.....	3,500,000
N. Y. city, steamship pier and freight....	750,000
Lakeview, Ill., grain elevator and brewery	600,000
Boston, Mass., lumber yard and other...	600,000
Jersey City, N. J., cork works and other..	700,000
Wallace, Idaho, half the town.....	1,000,000
Stevenson, Wash., sawmill and lumber..	600,000
James City, Pa., plate glass works.....	500,000
East St. Louis, Ill., railroad freight house	500,000
Superior, Wis., coal shed and wharf.....	500,000
Victoria, B. C., department store and other .....	1,000,000
Topeka, Kan., railroad storage yard.....	500,000
Omaha, Neb., creamery and cold storage plant .....	600,000
Philadelphia, Pa., business block and storage warehouse.....	500,000
Winnipeg, Man., wholesale drug house..	515,000
Livingston, Ala., lumber plant.....	500,000
Evansville, Ind., cigar factory and other..	750,000
Cincinnati, O., shoe factory and leather works .....	1,750,000
Chicago, Ill., meat packing plants.....	1,000,000
Bradwardine, Man., business portion of town .....	525,000

**FRITH, C. H.** See LITERATURE, ENGLISH AND AMERICAN, *History*.

**FISCHER, SYDNEY ARTHUR.** See CANADA, *Government and History*.

**FISCHER, THEOBALD.** A German geographer, died in October, 1910. He was born in Kirchsteitz in 1846 and was educated at the universities of Heidelberg, Halle, Bonn and Vienna. From 1879 to 1883 he was professor of geography at Kiel. In the latter year he took the same chair at Marburg. In 1886 he visited the Tunisian Sahara and two years later made a tour through Morocco and Algeria. His published writings include the following: *Raccolta dei mappemonde e carte nautiche del XIII. al XVI. secolo* (10 atlases containing 79 leaves, 1881); *Beiträge zur Geschichte der Erdkunde und der Kartographie in Italien im Mittelalter* (1886); "Die südeuropäischen Halbinseln," in Kirchhoff's *Unser Wissen von der Erde*, Vol. iii. (1892); and *La Penisola Italiana*.

**FISH AND FISHERIES.** The fiscal year of the United States Bureau of Fisheries ends on June 30 and the report for 1909 of the Commissioner of Fisheries appeared in June, 1910. It was reported that owing to greater economy of operation the work for the year had been carried on at less expense than in previous years, though more work had been done. Blueback and Chinook salmon had been successfully sent to New Zealand, a shipment in a previous year of rainbow trout having been entirely successful. Fish were sent also to Argentina, France, and Germany. The United States Fisheries Steamer *Albatross* returned to San Francisco in May, after a collecting trip extending over two and one-half years, in the region of the Philippine archipelago. Extensive collections were made, which have been distributed to specialists for study. According to this report the commissioner the quantity and value of the fish landed at Boston and Gloucester in the year 1908 were as follows:

	Lbs.	Value
Cod, fresh .....	41,615,277	\$1,042,683
Cod, salt .....	21,832,454	762,801
Cusk, fresh .....	5,066,499	88,726
Cusk, salt .....	140,772	3,531
Haddock, fresh .....	47,417,855	1,117,332
Haddock, salt .....	640,507	9,729
Hake, fresh .....	20,434,450	279,802
Hake, salt .....	122,442	1,833
Pollock, fresh .....	12,428,726	135,168
Pollock, salt .....	1,090,205	16,364
Hallbut, fresh .....	3,179,252	232,634
Hallbut, salt .....	946,558	66,263
Mackerel, fresh .....	5,507,820	308,594
Mackerel, salt .....	3,467,200	175,515
Herring, fresh .....	6,708,320	123,644
Herring, salt .....	8,587,396	136,590
Swordfish .....	1,357,854	119,633
Other fish, fresh .....	880,250	8,071
Other fish, salt .....	41,400	1,012

The Bureau of Fisheries has been investigating the catfishes of the United States, and a Bulletin on this subject appeared in 1910. These fish are omnivorous in their diet, but though they eat anything they can find, their flesh seems not to be at all injuriously affected by the character of the food. On account of their hardness they are excellent for artificial culture, and will thrive in all parts of the country. In the work of the Bureau of Fisheries the best results have been obtained with the "bull head" or yellow cat.

Louisiana was reported as potentially the equal of any State in its natural adaptability to oyster growing, and should develop a profitable industry in this line provided proper measures be taken to avoid overcrowding of beds, and that judicious measures of fishing be employed. Apparently freedom from the oyster borer may be had by planting in the fresher waters, a large amount of alkalinity favoring the growth of the borer.

The following table gives statistics of fisheries in each of the States according to a Federal census made for December 31, 1908:

The total value of the Alaskan fisheries for 1909 as reported in 1910 was \$11,181,388,000, mainly in the salmon fisheries, though cod, seal and whale fisheries were important.

It was reported during the year, that the experiment of shipping live fish in sealed cans in water charged with oxygen gas had been entirely successful. Fish were sent in this way from the United States to Germany, and a large percentage reached their destination in good condition.

The following table gives the production of the different kinds of fish in the United States and their value, according to a Federal census made for December 31, 1908:

	Pounds.	Value.
Products, total .....	1,893,548,200	\$54,030,630
Alewives .....	89,978,000	588,520
Black Bass .....	3,313,400	254,640
Bluefish .....	7,646,600	506,180
Buffalo .....	16,728,900	498,260
Carp, German .....	42,763,100	1,135,390
Catfish .....	18,386,900	792,830
Cod .....	109,452,600	2,902,880
Flounders .....	19,668,300	519,370
Haddock .....	59,987,400	1,308,500
Hake .....	34,372,100	464,530
Hallbut .....	34,441,600	1,562,020
Herring .....	165,317,100	1,759,230
Mackerel .....	12,679,400	861,140
Menhaden .....	394,776,400	893,010
Mullet .....	34,850,800	938,510
Perch .....	11,801,400	420,150
Pike perch .....	15,247,400	679,580
Pollock .....	29,462,000	401,850
Salmon .....	90,717,500	3,849,080
Sea Bass .....	7,689,100	325,610
Shad .....	27,641,100	2,113,400
Snapper .....	13,854,300	650,600
Squeteague or trout .....	60,555,700	2,534,120

**FITZGERALD, JOHN F.** See MASSACHUSETTS.

**FLAX.** Owing to dry weather in the principal flaxseed-producing States, Minnesota and the Dakotas, the yield of this product in 1910 was not large enough to cover home consumption. Although an area of 2,916,000 acres was devoted to flax the production amounted to only 14,116,000 bushels, and the average yield per acre to only 4.8 bushels. In 1909 25,856,000 bushels were produced on 2,742,000 acres, the average yield per acre being 9.4 bushels. The flaxseed production of the United States is limited practically to ten States, in which the acreage ranges from about 5000 to 1,500,000. The acreage and production of the leading States in 1910 was as follows: North Dakota, 5,778,000 bushels on 1,605,000 acres; Minnesota, 3,540,000 bushels on 472,000 acres, South Dakota, 3,300,000 bushels on 600,000 acres, and Montana, 420,000 bushels on 60,000 acres. The average yield per acre in these States was 3.6, 7.5, 5, and 7 bushels respectively. The highest acreage yield for the year was produced in Iowa, where it reached 12.2 bushels per acre. For the year ending June 30, 1910, the United States exported about 65,000 bushels of flaxseed and about 650,000,000 pounds of oil cake and meal. The annual flaxseed production of the world amounts to 100,000,000 bushels approximately. The yield in countries other than the United States was about normal, although in parts of Argentina the production was also reduced through drought. The world's flax-fibre crop, which amounts annually to about 2 billion pounds, came up to the average this year.

**FLICK, A. C.** See LITERATURE, ENGLISH AND AMERICAN, *History*.

**FLINDERS PETRIE, W. M.** See LITERATURE, ENGLISH AND AMERICAN, *History*.

**FLINT, ROBERT.** A Scotch theologian, died November 26, 1910. He was born in Dumfriesshire in 1834 and at a very early age entered the University of Glasgow. In 1858 he was licensed to preach and in the following year was called to the East Church, Aberdeen, from which he was transferred in 1862 to the country parish of Kilconquhar. Here amid quiet surroundings he lived the life of a student, laying the foundation of the immense erudition for which his writings are notable. In 1864 he was elected to the chair of moral philosophy in the University of St. Andrews. This position he held for twelve years, when, in 1876, he was transferred to the chair of divinity in the University of Edinburgh. In 1874 he edited his first important work, *The Philosophy of History in France and Germany*. In 1903 he resigned his University chair in order to devote himself entirely to literary work. Professor Flint ranks high as a philosopher as well as a theologian. As a defense of the fundamental doctrines of theism his writings have long occupied an authoritative position, while his exhaustive labors in philos-

ophy and history have been honored by the learned societies of Europe and America. Among his published writings are: *Christ's Kingdom on Earth* (1865); *Theism* (1877); *Anti-Theistic Theories* (1879); *Historical Philosophy in France* (1894); *Socialism* (1894); *Sermons and Addresses* (1899); *Agnosticism* (1903). He also contributed to the Encyclopædia Britannica and other encyclopædias and to various periodicals. In 1880 he was Stone Lecturer at Princeton University.

**FLOATING DOCKS.** See DOCKS AND HARBORS.

**FLORIDA.** The southernmost State of the American Union. It has an area of 56,666 square miles, of which 3085 square miles are water. The capital is Tallahassee.

**POPULATION.** The population of the State in 1910 according to the Thirteenth Census was 752,619, as compared with 528,542 in 1900 and 391,422 in 1890. The increase during the decade 1900 to 1910 was 42.4 per cent. The State ranks thirty-third in point of population, the same relative rank which it occupied in 1900. The population of the larger cities and towns will be found in the tables in the article CENSUS.

**MINERAL PRODUCTION.** The chief mineral product of the State is phosphate. The latest available statistics of production are those of 1908, when there was produced 1,692,102 long tons of phosphate rock, valued at \$8,484,539. The first shipment of pebble phosphate was made in 1888 from which date the industry has greatly grown. The production has shown an increase almost without exception each year since its beginning. The State produces also considerable quantities of clay products, mineral water and road making materials. The value of the mineral products in 1908 was \$9,167,762.

**AGRICULTURE.** The acreage, production and value of the principal crops in 1909 and 1910 are shown in the following table:

	Acreage	Prod. bu.	Value
Corn, 1910.....	678,000	8,814,000	\$7,492,000
1909.....	665,000	8,379,000	6,955,000
Oats, 1910.....	31,000	602,000	326,000
1909.....	31,000	527,000	395,000
Rice, 1910.....	900	19,000	14,000
1909.....	1,000	25,000	20,000
Potatoes, 1910.....	6,000	540,000	540,000
1909.....	5,000	475,000	570,000
Hay, 1910.....	19,000	25,000a	425,000
1909.....	19,000	26,000	390,000
Tobacco, 1910.....	3,500	2,380,000b	547,400
1909.....	4,500	3,195,000	1,086,000
Cotton, 1910.....		58,000c	
1909.....		54,011	

a Tons. b Pounds. c Bales.

**EDUCATION.** The total school population of the State in 1910, as estimated from the census of 1905, was 241,650, of whom 136,773 were white and 104,877 were colored. The total enrollment in the State in the school year 1909-10 was 148,089. Of these 92,834 were white and 55,255 were colored. The average daily attendance was 103,892, of whom 63,243 were white and 40,649 were colored. The teachers employed in the schools of the State numbered 4015, of whom 3041 were white and 974 were colored. The average monthly salary paid to male white teachers was \$88.13 and to female white teachers, \$55.80. The average salary of male negro teachers was \$33.68 and of female negro teachers, \$30.18. The total expenditure of public school funds in 1910 was \$1,773,388. The value of the school property in the State was \$2,311,-

469. An aggressive campaign was carried on in 1909-10 in the interest of education in the State. This resulted in the establishment of 150 school improvement associations, with a total membership of more than 10,000. Each member of this association is pledged to use his influence for the passage of a compulsory education law, the establishment of at least one high school in each county and a constitutional amendment of a one mill tax.

**FINANCE.** There was a balance in the State treasury on January 1, 1909, of \$268,106. The total receipts for the year ending December 31, 1909, amounted to \$1,178,766. The total disbursements for the year amounted to \$1,007,328, leaving a balance on January 1, 1910, of \$171,438. The chief sources of revenue are from taxation, general license tax, insurance company premium tax, the sale of fertilizer stamps and the corporation charter tax. The chief disbursements were for education, maintenance of the State institutions and legislative and executive expenses. The public debt of the State consists solely of refunded bonds amounting to \$601,567, bearing interest at the rate of 3 per cent., all of which are held by the education funds of the State.

#### POLITICS AND GOVERNMENT

There was no meeting of the State legislature in 1910 as the meetings are biennial and the last was held in 1909. The next session begins April 4, 1911.

**ELECTIONS.** Primary elections for candidates for the Senate were held on May 9. The contestants were Senator Taliaferro, who sought re-nomination, and N. B. Broward, former governor of the State. A third candidate was Claude L'Engle. Senator Taliaferro did not have a majority over Broward and L'Engle, and under the Florida law a second primary was necessary. This was held on June 7 and resulted in the defeat of Senator Taliaferro by Mr. Broward. The latter, however, died before he could take his place in the Senate. In the senatorial primaries the corporation question figured largely, Mr. Broward charging that Senator Taliaferro was the choice of and had acted as the agent in the Senate of corporation interests. In the first primary on May 9, nominations were also made for Congressmen. Congressman Sparkman of the First District had no opposition and was therefore nominated. Congressman Clark of the Second District and Congressman Mays of the Third District were also renominated. Mr. Clark was opposed by Louis Zim, representing organized labor, but the latter polled only a small vote.

On account of the death of Mr. Broward it was necessary to hold another primary election for Senator, and arrangements were made for such an election to be held on January 10, 1911. There were three candidates, W. A. Blount, John N. C. Stockton, and Nathan P. Bryan. Senator Taliaferro was not a candidate for re-election. On account of the provisions of the Florida law mentioned above, there was such a certainty that none of these candidates would receive the majority of the votes that still another primary election was planned for January 31. This election would constitute the sixth primary contest for the selection of a United States Senator within two years.

**STATE OFFICERS.** Governor, Albert W. Gilchrist; Secretary of State, H. C. Crawford; Treasurer, W. V. Knott; Comptroller, A. C.

Groom; Attorney-General, Park M. Trammell; Auditor, Ernest Amos; Adjutant-General, J. C. R. Foster; Superintendent of Public Instruction, W. M. Holloway; Commissioner of Agriculture, B. E. McLin—all Democrats.

**JUDICIARY.** Supreme Court: Chief Justice, J. B. Whitfield; Justices, W. A. Hocker, R. F. Taylor, T. M. Shackelford, Chas. B. Parkhill and R. S. Cockrell; Clerk, Milton H. Mabry—all Democrats.

**STATE LEGISLATURE, 1911.** The legislature is: Senate, Democrats, 32; House, Democrats, 70.

**FLUORINE.** See **ATOMIC WEIGHTS.**

**FLYING.** See **AERONAUTICS.**

**FLYNN, JOSEPH MICHAEL.** An American Roman Catholic priest, died January 5, 1910. He was born in Springfield, Mass., in 1848. His parents moved to Newark, N. J., where he was sent to the parochial school at St. Patrick's Cathedral. In 1861 he entered a printing office in that city, and in 1864 enlisted in the 37th New Jersey Volunteers. He served throughout the Civil War and received a medal of honor from Congress for bravery. In 1865 he entered St. Charles College, and in 1870 graduated from Seton Hall College. Following his graduation he entered the seminary of that college. He was ordained a priest in 1874. He successively filled the offices of diocesan chancellor, pastor of ceremonies and secretary of investigation of St. Patrick's, Newark, N. J., and for one year administered the parish. He was afterwards pastor of St. Mary's, Morristown. He was made a monsignor in 1904.

**FONSECA, HERMES DA.** A Brazilian public official, inaugurated on November 15 President of the Republic. He was born in 1855, and entered the army as a cadet at the age of 16. He was commissioned five years later lieutenant of artillery, and thence rose through all grades of the army to be Marshal of Brazil. During the previous administration he was Minister of War until he resigned prior to his election as President. He is considered the foremost military authority in South America. President da Fonseca has always manifested a friendly disposition toward the United States. He has repeatedly expressed himself as in favor of closer relations with that country rather than with Europe. One of his favorite projects is the establishment of a Pan-American bank.

**FOOD AND DRUGS ACT.** See **FOOD AND NUTRITION.**

**FOOD AND NUTRITION.** **FOOD INSPECTION.** The Federal Food and Drugs act of 1906 continued to receive vigorous enforcement. A total of 990 cases as regards interstate commerce was reported for prosecution, 496 more than in the year preceding. Fines aggregating \$11,049.31 were collected and 175 shipments were condemned and forfeited as adulterated and misbranded. Of 95,482 samples of imported foods and drugs examined, approximately 3000 were found to be illegal. The scope of the inspection of both imported and domestic goods was further extended, as regards imported goods, by a further systematizing of their examination at the smaller ports of entry, and as regards domestic products by a closer inspection of factories.

During the four years since the law went into operation, it has been a subject of great public interest. In the working out of the details of its enforcement criticism has been inevitable. This has been of two kinds, that which aimed to discredit the law because of selfish motives, and

criticism based on the interpretation of the law which has made it partially inoperative, as in the case of the whisky decision. The public has generally regarded the campaign for pure foods and drugs and the stamping out of frauds as involving a great moral issue, and has looked with disapproval upon any steps which would tend to nullify or restrict the law. Already much has been accomplished. Certain forms of adulteration formerly very common, such as the mixture of other oils with olive oil and its sale as the pure product, have now become rare. Cheeses made from skim milk are now generally properly labeled, and the use of boric and salicylic acid as preservatives has been practically driven from the trade. The law has afforded helpful protection to honest manufacturers and dealers desirous of handling only unsophisticated goods. The most important legal cases affecting goods entering into interstate traffic dealt with the bleaching of flour with nitrogen peroxide. It was the contention of the government that this practice enabled the substitution of inferior flours for more expensive grades, and was also objectionable in that the nitrites introduced were poisonous and deleterious to health. Large commercial interests were involved, including milling companies and manufacturers of milling machinery. Several test cases came to trial, in all of which decisions were rendered favorable to the government. Another important series of cases related to interstate traffic in desiccated and frozen egg products, which have been used exclusively in recent years in foods sold in cooked form. As a result of factory inspection and the examination of interstate shipments, a large number of prosecutions were instituted, and several tons of these products destroyed because of their contaminated and filthy nature. The chief violations as regards drug products were for misrepresentation of their composition and curative properties. In many cases goods sold as headache remedies, cough reliefs, cancer and consumption cures, and even drug-addiction cures, and in some instances as medicated soft drinks, were found to contain dangerous habit-forming drugs. Fraud orders prohibiting the use of the mails were issued against many of these so-called "cures." As a result of studies of the influence of tin receptacles on the composition of canned goods, a decision by the board of food and drug inspection was announced restricting the content of tin salts allowed in foods canned after January 1, 1911. Other important decisions of the year dealt with the labeling of whiskies and yeasts, the floating of shell-fish, the restriction of the use of geographical names to products from these localities, and the use of artificial dyes. See MEAT AND MEAT INSPECTION.

**FOOD CONTROL IN THE STATES AND IN FOREIGN COUNTRIES.** Interest in pure food control through State and municipal agencies was also strongly sustained, Maryland put in operation a food and drug law and Vermont a new weights and measures law. Whereas in 1905 only 25 States and Territories possessed effective laws and were enforcing them, Mississippi is to-day the only State with no pure food law, and there are three others, Arkansas, Montana, and West Virginia, in which the laws are rendered inoperative by a lack of State appropriations and effective machinery for their enforcement. In foreign countries little additional legislation was enacted, but there was a general tendency toward

the more rigid enforcement of existing laws. A comprehensive meat inspection law went into effect in Uruguay. France strengthened its laws as to the adulteration of edible fats and oils and of wines, and a decree governing imported liquors and canned goods was promulgated in the Republic of Salvador.

**COST OF FOOD.** Despite the high price levels reached by food products, as of most other commodities, during 1909, there were still further advances during 1910 in most civilized countries, and in the United States retail prices reached the highest point for many years. For instance, as compared with 1900, bacon was more than 70 per cent. higher, ham about 33 per cent. higher, flour 50 per cent. higher, butter 45 per cent. higher, sugar 12 per cent. higher, and eggs 100 per cent. higher. A few articles, such as coffee and tea, remained at the same level, but practically nothing was lower. In the case of cereals and other products sold in packages, the increase commonly took the form of a reduction in the size of the package. Widespread agitation resulted from this situation, the feeling being particularly strong as regards the prices of meats. In several of the larger cities so-called "meat boycotts" were organized with the object of compelling a reduction in prices through the curtailment of the consumption of meat, but these movements were too sporadic and localized to produce more than temporary relief.

**OFFICIAL INQUIRIES INTO COST OF LIVING.** In response to the popular demand for a knowledge of causes, a select committee on wages and prices of commodities was organized in the United States Senate, February 9, and a commission on the cost of living was appointed February 28 in the State of Massachusetts. Both of these bodies held extended hearings and devoted much of their attention to the cost of food. The Senate committee divided in its findings along party lines. Among the causes assigned by the Republican majority for the advance in prices were the increased cost of production of farm products through higher land values and wages; the shifting of population from food-producing to food-consuming occupations and localities, and immigration to the latter; the reduced fertility of the land; increased banking facilities in agricultural localities; the operation of cold storage plants; increased cost of distribution; industrial combinations, including dealers' organizations; the increased use of advertising; the increased money supply; overcapitalization; and the higher standard of living. The Democratic minority concurred as to the operation of some of these factors, but enumerated as the three principal causes the protective tariff, the formation of trusts and monopolies, and the increased money supply. Both parties united in recommending federal legislation limiting the time in which perishable foods may be held in cold storage, in the belief that such action would tend toward an equalization of prices and also for hygienic reasons. A bill along this line was pending at the close of the year.

The Massachusetts commission rendered an extended report, in which the primary cause of the general advance in prices was deemed to be the increase of the gold supply, but considerable importance was ascribed to uneconomic methods of producing, distributing and using food. Among these causes were the drain of population

from the land with the consequent increase of non-producing consumers, the use of highly-advertised and proportionately expensive package goods, the multiplication of small retail stores, and the growth of the costly delivery system.

**COST OF FARM PRODUCTS.** In spite of the admitted increase in retail prices, investigations reported by the Secretary of Agriculture indicated that the farmers' share of the retail price is no larger than ten years ago, and is perhaps fifty cents of the consumer's dollar. Other investigations indicated that for many products, notably fruit and vegetables, it is often not more than from thirty to forty cents. A remedy suggested was the more complete elimination of the middleman through the direct purchase of certain farm products, coöperative associations of farmers selling by direct consignment to similar associations of consumers in cities. This plan is already in operation to some extent in England, where, however, a parcels-posts system is available. See AGRICULTURE.

**GENERAL CAUSES.** As already pointed out, the high cost of food was by no means merely an American problem, but was virtually of world-wide character. Some of the causes assigned abroad were of a local nature, but the increased gold production and the trend toward a higher standard of living were recognized as having a marked influence in every civilized community. Toward the close of the year the advance of prices of food products seemed to be partially arrested, though there was general uncertainty as to whether the maximum had been reached or the respite only temporary. *Bradstreet's* reported on December 1, 1910, that 56 commodities, among them pork and hog products, butter, cheese, sugar, tea, most cereals, and their products, beans, and potatoes, were lower than on December 1, 1909, while 34, including beef, eggs, fish and coffee, were higher, and 16, among them milk and bread, had remained unchanged. It was noted, however, that as is usually the case following high levels, retail prices were receding much more slowly than were wholesale rates.

**PROGRESS IN FOOD AND NUTRITION STUDIES.** One of the effects of the high prices was to increase popular interest in food and nutrition studies, especially those of direct application in the home, and in publications dealing with these topics. A popular discussion of the economical use of meat in the home, prepared as a part of the nutrition investigations of the United States Department of Agriculture, and containing in addition to other data receipts for the utilization of the cheaper cuts of meat, met with wide distribution under the name of *Uncle Sam's Cook-Book*, over 500,000 copies being printed to meet the demand. Several studies of the diet of various classes of people were reported during the year. One of these, dealing mainly with persons living in rural regions, indicated that the prevailing diet of the white mountaineers living in the southeastern States is largely made up of salt pork, corn meal, and wheat flour, and is not only lacking in variety, but is also low in protein. Another series of studies among the orphaned and aged in public institutions in Baltimore and Philadelphia led to an estimate of much value in institution dietetics that the relative food consumption of aged people, irrespective of sex, averages about 0.9 of that of a man of full vigor at moderate work, and that for extreme

old age is from 0.7 to 0.8 the normal consumption.

A notable contribution along similar lines was a further study of the native peoples of Bengal, where diets of great diversity have been adhered to by different tribes for generations. These studies were of particular interest because of their bearing on the much-discussed protein optimum. An intimate relation was found to exist between a high nitrogen metabolism and the position of a people in the scale of mankind. A comparison of the relative food value of beef and cheese was continued by the United States Department of Agriculture. By the use of its respiration calorimeter the fact was brought out that cheese, contrary to the popular belief, requires no more energy for its digestion than beef. Experiments reported by the Texas Experimental Station demonstrated that palatable cakes, bread and other foods can be prepared with cottonseed meal as an ingredient, and that these foods are very rich in protein. In another study with considerable commercial possibilities, it was found that many varieties of dates can be marketed in an immature condition and then ripened artificially through exposure to the vapor of acetic acid and certain other substances thereby minimizing bruising in transit and souring during unfavorable weather.

A number of scientific studies were reported dealing with cold storage, especially of poultry and eggs. Proper and prompt handling of these products before storage was found to be a most important factor, and when followed both poultry and eggs were found to be of good quality and flavor up to from six to nine months in storage.

Much interest was shown during the year in institution dietetics, one manifestation being in the provision of "penny lunches" for school children in several of the larger cities. A conference on household and institution management was held at Lake Placid, N. Y., June 28 to July 2.

Instruction in food and nutrition was widely offered, many institutions of all grades adding domestic science courses to their curriculum. The third Graduate School of Home Economics was held at the Iowa State College, July 6-20, in connection with the Fourth Graduate School of Agriculture.

The most important international gathering of the year was the Second Congress of Alimentary Hygiene. This was held at the Brussels Exposition, October 4-8, under the patronage of the King of the Belgians and the Belgian government, and attracted a large attendance.

**BOOKS OF THE YEAR.** A few of the more important publications dealing with food and nutrition to appear in 1910 were the following: T. B. Osborne, *The Vegetable Problem* (London and New York); J. B. Leathes, *The Fats*, (New York); J. Rennes, *Traité de l'inspection des Viandes* (Paris); R. Luce et al., *The Cost of Living* (Boston, State Commission); H. H. B. Meyer, *Select List of References on the Cost of Living and Prices* (Washington, Library of Congress); C. R. Askwith, *Cost of Living in Belgian Towns* (London government); W. S. Hall, *Nutrition and Dietetics* (New York and London); M. Labbé, *Régimes alimentaires* (Paris); N. Zuntz and A. Loewy, *Lehrbuch der Physiologie des Menschen* (Leipzig). See separate articles

on food products, also LIQUORS, FERMENTED AND DISTILLED.

**FOOT AND MOUTH DISEASE.** See VETERINARY SCIENCE.

**FOOTBALL.** The rule experts after many conferences in the spring of 1910 evolved what practically amounted to a new game of football. The radical changes made were the result of the severe and wide-spread criticisms which reached their climax in 1909 and which were due to the deaths and many serious injuries resulting from the contests of that and previous years. According to the statistics gathered by a New York newspaper, the rule-makers were only partially successful in eliminating the danger element from the game. These figures show that in 1910 there were 14 deaths attributed to football as against 32 in 1909 and that 40 players were seriously hurt as compared with 73 in 1909. Significant in this connection, however, is the fact that no deaths occurred among the players in the larger colleges where a careful training system is adhered to, nor were there many serious injuries among such players. The experts insisted, therefore, that the aim of the rule-makers had been very nearly achieved. The most important of the new rules were those permitting a player to be taken out and substituted again at any time, dividing the game into four periods instead of two halves, prohibiting mass plays and restricting the use of the forward pass. Considerable dissatisfaction was expressed by those interested in the game over the workings of the forward pass and it is likely that changes will be made in the rules governing this play. As a whole, however, it is believed by the majority of the experts that the new kind of football has come to stay.

The season was one of surprises, the greatest being the wonderful rally of Yale after defeats administered by West Point and Brown and the scoreless tie with Vanderbilt. These reverses instead of disheartening the Yale men only served to inspire them to greater effort with the result that Princeton was vanquished and Harvard played to a standstill, neither eleven being able to score. Harvard went through the season without suffering a defeat and was undoubtedly the strongest team in the country. Annapolis also had a string of unbroken victories, but did not meet teams of the same calibre as Harvard. Pennsylvania's record was good although an unexpected defeat was sustained early in the season at the hands of Ursinus.

The results of the principal games played by the Eastern Colleges follow: *Harvard* defeated Bates 22-0, Bowdoin 32-0, Williams 21-0, Amherst 17-0, Brown 12-0, West Point 6-0, Cornell 27-5, and Dartmouth 18-0, and played a scoreless tie with Yale. *Pennsylvania* defeated Dickinson 18-0, Gettysburg 20-0, Franklin and Marshall 17-0, Brown 20-0, Pennsylvania State 10-0, Carlisle Indians 17-5, Lafayette 18-0, and Cornell 12-6; lost to Ursinus 5-8, and tied with Michigan 0-0. *Annapolis* defeated Washington and Jefferson 15-0, Virginia Polytechnic Institute 3-0, Lehigh 30-0, New York University 9-0, and West Point 3-0, and tied Rutgers in a scoreless game. *Brown* defeated Tufts 27-9, Yale 21-0, Vermont 50-0, and Carlisle Indians 15-6; was defeated by Pennsylvania 0-20, and Harvard 0-12, and played a scoreless tie with Colgate. *Yale* defeated Wesleyan 22-0, Syracuse 12-6, Tufts 17-0, Holy Cross 12-0, Colgate 19-0,

and Princeton 5-3; lost to West Point 3-9, and to Brown 0-21, and played scoreless ties with Harvard and Vanderbilt. *Princeton* defeated Stevens 18-0, Villanova 36-0, New York University 12-0, Lafayette 3-0, Carlisle Indians 6-0, Dartmouth 6-0, and Holy Cross 17-0, and lost to Yale 3-5. *Dartmouth* defeated Colby 18-0, Vermont 33-0, Williams 39-0, and Amherst 15-3; and lost to Princeton 0-6, and to Harvard 0-18. *West Point* defeated Tufts 24-0, Lehigh 28-0, Villanova 13-0, and Trinity 17-0, and lost to Harvard 0-6, and to Annapolis 0-3. *Cornell* defeated Hobart 50-0, Vermont 15-5, and Chicago 18-0; lost to Harvard 5-27, and to Pennsylvania 6-12, and played a scoreless tie with Oberlin.

Michigan's victory over Minnesota settled the championship among the Western Colleges. The principal games played in the West resulted as follow: *Michigan* defeated Michigan Agricultural College 6-3, and Minnesota 6-0, tied Case School 3-3, and Ohio State 3-3, and played a scoreless tie with Pennsylvania in the East. *Minnesota* defeated Ames 49-0, Nebraska 27-0, Chicago 24-0, and Wisconsin 28-0, and lost to Michigan 0-6. *Illinois* defeated Northwestern 27-0, Indians 3-0, Drake 29-0, Purdue 11-0, Chicago 3-0, and Syracuse 3-0. *Indians* defeated Chicago 6-0, Wisconsin 12-3, and Purdue 15-0. Vanderbilt's tie game with Yale gave the Tennessee University first rank among the Southern colleges. Georgetown also made a good showing.

The selections made by Walter Camp for the All-American team were: Ends—Kilpatrick (Yale) and Wells (Michigan); tackles—McKay (Harvard) and Walker (Minnesota); guards—Fisher (Harvard) and Benbrook (Michigan); centre—Cozens (Pennsylvania); quarterback—Sprackling (Brown); halfbacks—Wendell (Harvard) and Pendleton (Princeton); fullback—Mercer (Pennsylvania).

The championship of the Intercollegiate Soccer League was won by Columbia, whose team went through the season without suffering defeat. Yale finished second and Harvard third. In England the annual match between Oxford and Cambridge was won by Oxford. In international games England defeated France and Switzerland but lost to Scotland. Clan McDonald won first place in the series played by the New York Amateur Association Football League. The Tacony A. C. of Philadelphia captured the American Cup by defeating the Scottish-Americans of Newark.

**FOREIGN RELATIONS, UNITED STATES.** See UNITED STATES.

**FOREIGN TRADE.** See UNITED STATES, and under different countries.

**FORESTIER-WALKER.** General Sir FREDERICK WILLIAM EDWARD. An English soldier, died August 31, 1910. He was born in 1844 and was educated at Sandhurst. In 1862 he entered the Scots Guards. From 1869 to 1873 he was adjutant. He served in the Kaffir War, 1877-8, and was mentioned in the despatches for bravery. In 1878-9 he was military secretary to Sir Bartle Frere. He served in the Zulu war of 1879 and received a medal for gallantry. In 1888-9 he commanded an infantry brigade at Aldershot. From 1889 to 1895 he

commanded troops in Egypt and from the latter year to 1899 was lieutenant-general commanding the Western District. From 1899 to 1901 he was lieutenant-general in command of the lines of communication of the South Africa Field Force and for the third time received a medal for bravery. From 1905 to the time of his death he was governor of Gibraltar.

**FOREST LEGISLATION.** See FORESTRY.

**FOREST RESERVES.** See FORESTRY and CONSERVATION.

**FORESTRY.** The forestry problem of the United States is the conservation of the remnants of our forests, using the mature products, but providing for future necessities. Originally forests covered about 60 per cent. of the United States. This area has been greatly reduced, and according to the Eleventh Census report about 36 per cent. of the land area was in forests. The percentage has suffered further loss, as in 1910 the estimated area was about 540,000,000 acres, or 29 per cent. of the total. From much of the present area reported as in forest most of the merchantable timber has already been cut. Private owners hold 81 per cent. of the present forests while 18.5 per cent. are in National Forests and 0.5 per cent. are in State reserves.

**FOREST FIRES.** The year 1910 will long be remembered for the enormous fire losses in the forests of the United States. The early summer was characterized by an exceptional drought, particularly in the northwestern portion of the country. The losses due to forest fires had already amounted to \$100,000,000 when in August a series of conflagrations broke out in Montana, Idaho, Oregon, and Washington, and before they were extinguished an amount of timber almost equal to the entire cut of the whole country for two years had been destroyed. These fires are believed to have caused the destruction of timber valued at \$175,000,000, and the cost of fighting them is estimated at over \$1,500,000. In addition to the financial losses, 76 persons were killed and Wallace, Idaho, and several smaller towns were almost entirely destroyed. To meet the urgency of the situation every available source was drawn upon, and the United States Forest Service employed over 2000 men and 16 companies of troops were detailed for work in the National Forests and the Indian reservations. In addition, railroads, lumber companies, and private individuals aided in checking the spread of the fires, which were finally extinguished by timely rains and snow in the mountains. The lesson of these fires is the inadequacy of the present means for fire control over such large areas.

**MEETINGS.** The twenty-ninth annual meeting of the American Forestry Association was held in Washington, D. C., January 18, 1910. The second National Conservation Congress was held at St. Paul, Minn., September 5, and the Southern Conservation Congress at Atlanta, Ga., October 7. The annual meeting of the Canadian Forestry Association was held at Fredericton, N. B., February 24. The sixth International Union of Forest Experiment Stations met in Belgium in September, 1910. Meetings of the Forest Supervisors of Districts 1 and 6 were held at Missoula, Mont., and Portland, Ore., in March, 1910.

**CONSUMPTION.** According to preliminary reports of the United States Bureau of the Census, the total lumber cut of 1909 was 44,585,000,000

feet B. M., as compared with 32,224,000,000 the year previous. The various species of southern pines that are commercially known as yellow pine contributed 22,000,000,000 feet, or 49.2 per cent. of the entire lumber production, followed by Douglas fir (10.9 per cent.), and white pine (8.8 per cent.) among soft woods, and oak (10 per cent.) of the hard woods. The soft woods supplied about 33,875,000,000 feet and the hard woods 10,693,000,000 feet of the cut. The ten leading States in order of their lumber production for 1909 were: Washington, Louisiana, Mississippi, North Carolina, Arkansas, Virginia, Texas, Wisconsin, Oregon, and Michigan. The railroads purchased cross-ties in 1909 to the number of 123,754,000, costing \$60,321,000. There were 253 wood pulp mills in operation during the whole or part of 1909 and they consumed 4,002,000 cords of wood, an increase of 19 per cent. over the year previous. The total production of air-dry pulp was 2,491,406 tons, as compared with 2,118,947 tons in 1908. An estimate of the firewood consumed in the United States shows there is annually used over 86,000,000 cords of wood of an average value of \$2.91 per cord. Of this amount about 81 per cent. is consumed on farms. The exports of wood and manufactures of wood for the year ended June 30, 1910, were valued at \$78,813,803, and the imports for the same period were worth \$54,422,504.

**THE NATIONAL FOREST SERVICE.** On June 30, 1910, there were 149 National Forests, 146 in continental United States, 2 in Alaska, and 1 in Porto Rico. The total area at that time was 192,931,197 acres. During the year there were 2,037,545 acres eliminated from the National Forests and 467,517 acres added by executive order. Further changes were made in the boundaries of the National Forests, and on September 30, 1910, the number was 152 and the gross area 191,548,757 acres, 11 per cent. of which is alienated land held by States or individuals. There was expended by the Forest Service for general expenses in 1910, \$3,575,394.21, and for the improvement of the National Forests \$537,101.27. The total appropriations for the year were \$4,697,731.08. The number of employees of the Forest Service on July 1, 1910, was 3636, of whom 3397 were stationed out of Washington, D. C. The moneys received from the sale of timber, grazing permits, etc., amounted to \$2,090,148.08. Of this sum \$438,702.81 was returned to the States in which the income was earned, to be applied to school and road purposes. The usual free use of timber and grazing privileges to settlers was granted. The policy of decentralizing much of the work of the National Forests by establishing district headquarters has proved very satisfactory. New regulations regarding grazing in the National Forests have been promulgated, and a new edition of the *Woodman's Handbook* was issued.

Detailed studies are being made of the distribution of the more important forest tree species in the National Forests and means for their increase. More than ten tons of seed of forest trees were used in 1910 in extending the forest plantings. Efforts are being made to find uses for the less valuable woods, and it has been shown that by using the odd lengths of lumber a saving of over 2 per cent. of the cut of the Pacific Coast States is possible, and a like economy could be practised with yellow pine in

the South. The Forest Products Laboratory was formally opened at Madison, Wis., on June 4, 1910. The University of Wisconsin furnishes the building and the Forest Service the equipment and staff, and it is intended to carry on in this laboratory the chemical and physical tests of timber, investigations on the preservation and utilization of wood, etc. A statistical office, with headquarters at Chicago, has been established. A cooperative experiment has been begun between the United States Weather Bureau, Forest Service, and Geological Survey in two National Forests, where measurements of stream flow will be made for a number of years, after which one of the watersheds will be denuded and further observations made to compare the stream flow with and without forest cover. The experiment will be on a scale sufficient to give important data on this much discussed topic.

**PROGRESS IN STATE FORESTRY, LEGISLATION, ETC.** Relatively few of the State legislatures were in session in 1910, but in a number of instances laws were passed strengthening the fire control and other protective features of forest management. In California, Vallejo has become one of the pioneers in municipal forestry and several thousand acres about its water supply are being afforested. In Connecticut more than 500,000 forest trees were set out by private parties. In Hawaii cooperative planting experiments with eucalyptus are being extended, and rubber tapping experiments have shown the possibility of rubber production in that territory. In Kansas a new forestry law was passed and provision made for forest substations. In Kentucky the Forest Service has made surveys in six districts. The legislature of Louisiana passed a new forestry law for that State. In Maine prizes have been established under State patronage for the best woodlots, the prizes to be awarded at intervals of 18 years.

Massachusetts has acquired 2000 acres of land that are being planted as an object lesson. In 1910 more than 1,000,000 forest trees were planted under the supervision of the State forester, and an experiment in thinning a 50-year-old white pine woodlot is being made as a demonstration. Maryland has 4 State forests aggregating 1957 acres to be used as object lessons in forestry. Minnesota now has 3 State forests and a State forest experiment station, the combined areas of which are nearly 40,000 acres. Active steps have been taken toward the acquiring of a State forest of 2000 acres in Nebraska. New Jersey owns 9897 acres of forest lands which are managed as demonstration areas. In New York a new State forest, to be known as the Highlands of the Hudson Reservation, has been established. On January 1, 1910, the State owned 1,841,523 acres in the Adirondack and Catskill mountains. The Public Service Commission has ordered railroads passing through the State forests to equip their engines with oil burners to lessen the liability of forest fires. Pennsylvania now owns State forests containing nearly a million acres.

In the Philippines the Bureau of Forestry continues to do excellent work. The virgin forests are being studied and the mapping of Luzon and Mindanao has been completed. The forest area has been divided into 3 districts, each of which is under an American superintendent with Filipino foresters, guards, etc. The

revenue received from the sale of forest products for the year ended June 30, 1909, was 251,380 pesos. Experimental plantings of eucalyptus have been begun along the Gulf of Mexico in Texas. Vermont has established two State forests embracing 810 acres, and experiments are in progress in reforesting the sand plains along Lake Champlain. The Pennsylvania and the Santa Fé Railroads are actively engaged in forest planting along their trackage. The United States Department of the Interior has organized a forest service for the management of the forests on the Indian reservations. The Weeks bill, by which the White Mountain and Appalachian forests will be protected, passed the House of Representatives on June 24, 1910, and at the close of the year was pending in the Senate.

**FORESTRY IN FOREIGN COUNTRIES.** By a recent estimate the forest area of the world is placed at 4,000,000,000 acres, or 24 per cent. of the total land area. The countries estimated as having more than 10,000,000 acres of forest land are as follows:

#### EXTENT OF PRINCIPAL FOREST AREAS OF THE WORLD

Country.	Forest area. Acres.	Proport. of forest to total area. Per cent.
Russia, European .....	464,610,000	36.3
Finland .....	52,500,000	54.4
Austria .....	23,996,266	26.5
Hungary .....	18,692,000	25.7
Sweden .....	40,390,325	48.0
Germany .....	34,989,675	25.9
France .....	24,021,587	18.5
Norway .....	16,848,000	21.0
Spain .....	16,065,000	13.0
Italy .....	10,115,404	14.3
Russia, Asiatic .....	348,030,000	...
India .....	149,000,000	24.0
Japan .....	57,718,410	...
Philippines .....	49,000,000	...
Australasia, British .....	126,720,000	19.8
Madagascar .....	25,000,000	19.0
South America, tropical .....	528,000,000	...
Central Africa .....	324,000,000	...
West Indies .....	42,668,800	66.6
Canada .....	799,360,000	38.0
Mexico .....	25,000,000	5.1
Alaska .....	107,000,000	...
United States .....	545,000,000	29.0

For most of the countries the area given does not all represent productive forests or areas bearing commercial timber.

In Prussia a movement is on foot to decentralize the administration of the forests by increasing the responsibility of the district managers. The forestry budget for 1910 was increased by \$2,100,000 over that of 1909. From 1903 to 1907 forest fires in Prussia destroyed timber to the value of \$800,000, of which \$140,000 was insured. In England the Royal Agricultural Society is attempting to foster forestry by a series of prizes for the best managed forest plantations. During the past year great interest has been taken in rubber plantations and a large number of companies have been incorporated, especially in England, for rubber planting, the subject attaining speculative proportions. In India the forest systems are being extended so as to include all the forest domain under management. The teak forests of Siam are now under the supervision of European officers. China has established a school of forestry and forest planting has been begun. New South Wales has set aside forest reserves to the extent

of 7,000,000 acres. A forestry department has been established in the British Gold Coast of Africa, with M. McLeod as conservator. Extensive tree planting operations have been begun in Natal and Nyassaland. D. E. Hutchins has been appointed conservator of forests for British East Africa. A Canadian commission has been appointed to make an inventory of the forests of that country. A new forest reserve has been proclaimed covering the entire Rocky Mountain slope in Canada, from the international boundary to latitude 54° N. A preliminary survey has been begun of the forest resources of parts of Mexico, and a proclamation went into effect in Grenada on December 1, 1910, looking to the conservation of the timber and water supplies of that colony.

**FOREST SCHOOLS AND ORGANIZATIONS IN THE UNITED STATES, ETC.** Instruction in forestry was provided for during the year at the University of Missouri, Massachusetts Agricultural College, Washington Agricultural College, Louisiana State University, University of Ohio, Oregon Agricultural College, and Kansas Agricultural College. There are now 50 institutions in the United States which offer instruction in forestry, the courses varying from graduate instruction to undergraduate courses, forestry as a subject in courses, special courses, and secondary schools. A correspondence school in forestry has been provided for at the Agricultural College of South Dakota. The Biltmore movable School of Forestry spent the winter of 1910 at Darmstadt, Germany, after which several weeks were spent in the Adirondacks, returning to Biltmore, N. C., for the summer. A chair of lumbering in the Yale Forest School was endowed by the National Lumber Manufacturers' Association. Mr. Joseph Battell has offered 10,000 acres of wild land in Vermont to Middlebury College to use for a school of forestry. As a result of the conference of forest school officers in Washington December 30, 1909, a standard course of forestry was outlined. In the University of the Philippines a 4-year course in forestry has been provided. Half the work will be practical field work, and Filipino graduates will be appointed forest rangers without examination. A bill establishing a National School of Forestry at Nebraska City, Neb., in honor of J. Sterling Morton was introduced in the United States Senate by Senator Burkett. A forestry school has been established in connection with Laval University, Quebec. In 1910 twenty-nine States had State forest officers and there were 33 fully organized State forestry associations. An international committee for the publication of the bibliography of forestry has been established.

Among recent appointments, G. H. Wirt has been made chief forester of Pennsylvania; C. R. Pettis succeeded Austin Cary as superintendent of State forests of New York; S. J. Record has become an instructor in the Yale Forest School; O. L. Sponsler, adjunct professor of forestry in the University of Nebraska; and Charles A. Scott, State forester of Kansas. Prof. C. Guyot, director of the Forest School at Nancy, France, from 1898, retired April 1, 1910. He was succeeded by M. Dubreuil. Prof. E. P. Stebbing was inaugurated as head of the forestry department of the University of Edinburgh, Scotland, October 12, 1910. Prof. S. B. Green, State forester of Minnesota, died July 11, 1910, and W. R. Fisher, author of volumes

4 and 5 of Schlich's *Manual of Forestry*, on November 13, 1910. See CONSERVATION.

**FOREST SCHOOLS.** See FORESTRY.

**FORESTS IN UNITED STATES.** See FORESTRY.

**FORMOSA, or TAIWAN.** An island off the China coast, a Japanese dependency. Estimated area, 13,503 square miles; estimated population (1909), 3,123,723. A census report published at the end of 1909 states that the "total population of Formosa existent at the time of the present investigation, i. e. at the hour between midnight and one a. m. on the 1st day of the 10th month in the 38th year of Meiji (October 1, 1905), was 3,039,751." This figure, it is explained, includes 20,459 persons temporarily present and does not include 28,009 persons temporarily absent; so that the total permanent or settled population was reported at 3,047,391. Of the 3,039,751 persons, 1,610,816 were males and 1,428,935 females; Formosans, 2,073,280 (1,567,548 male, 1,405,732 female); Japanese, 57,335 (34,624 males, 22,711 females); foreigners, 9136 (8644 males, 492 females); of the foreigners 8973 were Chinese. Of the native population 3.9 per cent. were returned as opium eaters and smokers. It should be noted that this "investigation" covered only the portion of the island under actual Japanese control, that is, the western part and a strip along the east and south coasts, or an area of 1222 square ri (7277 square miles). The Japanese are steadily enlarging their administrative territory, but constant military operations are necessary, and in 1910 frequent engagements with the savage tribes of the eastern inland part of the island were reported. On October 1, 1905, Taihoku, the capital, had 74,415 inhabitants; Tainan, 50,712; 1908 estimate, 87,745 and 54,066 respectively. Of the population (October 1, 1905), only 2.38 per cent. were able to read and write, but, among many other improvements, the Japanese have established and are developing an educational system. The latest educational report available is for the year ended December 31, 1907. There were 1128 schools of all kinds, with 1944 teachers (of whom 547 were Japanese and 1828 men) and 59,321 pupils (of whom 4525 were Japanese and 52,907 boys). Public schools for the natives numbered 102, with 765 teachers and 34,382 pupils (30,612 boys); for the "aborigines," 15 (46 teachers, 1201 pupils); shobo schools (private schools maintained by the natives), 873, with 886 men teachers and 18,612 pupils (18,236 boys). There are a few public higher and foreign private schools.

In 1909 the estimated area under cultivation was 1,618,800 acres. The leading product is rice; others of importance are tea, sugar, opium, ramie, jute, and sweet potatoes. A large part of the world's camphor supply is obtained in the forests under government monopoly. Gold (40,680 ounces in 1907) and coal are the leading mineral products. Manufactures include sugar, flour, oil, tobacco, spirits, iron-work, glass, soap, brick, etc.

Imports and exports of merchandise in 1907 were valued at 30,971,000 and 27,376,000 yen respectively; in 1908, 38,002,000 and 33,721,000; in 1909, 36,597,000 and 47,998,000. The leading imports are textiles, metal wares, lumber, tobacco, and opium. The principal exports are rice, tea, and camphor. Imports from Japan in 1909 amounted to 24,007,000 yen, and exports

thereto, 36,310,000. There are upwards of 300 miles of railway in operation, exclusive of over 170 miles of light railway for sugar plantations. Telegraph lines (1908), 847 miles; wires, 2861 miles. Post-offices (1908), 128.

The estimated revenue and expenditure for the fiscal year 1909 balanced at 33,871,328 yen; 1910, 29,951,449; 1911, 38,689,763. Revenue consists largely of inland taxes, customs, and subsidies from Japan; expenditure is chiefly for internal administration and public works. Japanese government in Formosa began March 31, 1896. The governor-general in 1910 was Lieut.-Gen. Count Sakuma.

**FORSTER, E. M.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction*.

**FOSS, CYRUS DAVID.** An American bishop of the Methodist Episcopal Church, died January 29, 1910. He was born in Kingston, N. Y., in 1834 and graduated from Wesleyan University in 1854. From 1854 to 1857 he was instructor and principal of Amenia Seminary, N. Y. In the latter year he entered the itinerant ministry in the New York Conference. From 1857 to 1859 he was stationed at Chester, Orange County, N. Y., and from 1859 to 1865 was pastor in Brooklyn. From the latter year to 1875 he was pastor in various New York churches. From 1875 to 1880 he was president of Wesleyan University. He acted as fraternal delegate to the Conference of the Methodist Episcopal Church South in 1878 and to the British Wesleyan Conference in 1886. He was elected bishop in 1880 and in his official capacity visited the Methodist Episcopal missions in Europe, 1896; in Mexico, 1893; in India and Malaysia, 1897-8. He made a tour of missionary observation around the world, 1906-7. He was the author of *Religious Certainties*, and *From the Himalayas to the Equator*.

**FOSS, EUGENE NOBLE.** See MASSACHUSETTS. **FOSSILS.** See GEOLOGY.

**FOSTER, JUDITH ELLEN (HORTON).** An American lawyer and lecturer, died August 11, 1910. She was born at Lowell, Mass., in 1840 and was educated in the public schools and in the Genesee Wesleyan Seminary. In 1855 she removed to Clinton, Ia., where in 1869 she was married to E. C. Foster, a lawyer. She studied law and was admitted to the bar in 1872. She became prominent in the work of the Woman's Christian Temperance Union and was superintendent of the legislative department and popular lecturer for that organization. When it became politically affiliated with the Prohibition party she withdrew from it and entered the non-partisan Woman's Christian Temperance Union. Mrs. Foster was for many years active in political campaigns. In 1907, on the death of her husband, she was appointed a special agent in the Department of Justice at Washington. She was one of the few women admitted to practice before the United States Supreme Court.

**FOSTER, JOHN P. C.** An American physician, died April 1, 1910. He was born in New Haven, Conn., in 1847 and graduated from Yale College in 1869. He entered the Yale Medical School and graduated in 1875. After his graduation from the Medical School he delivered the first course of lectures on anatomy in the Yale Art School. For a time he was post surgeon at New Haven for the United States Marine Hospital Service. He was active in anti-tuberculosis work in both State and national societies and in 1908 was chosen vice-president of the National

Society for the Study and Prevention of Tuberculosis. In 1909 he was appointed by the governor a member of the Connecticut Tuberculosis Commission and was elected chairman. The success of the Gaylord Farm Sanitarium at Wallingford, Conn., was mainly due to his efforts. In recognition of his services in anti-tuberculosis work the degree of Master of Arts was conferred upon him by Yale University in 1909.

**FOSTER, J. W.** See LITERATURE, ENGLISH AND AMERICAN, *Biography*.

**FOULKROD, WILLIAM W.** An American public official, member of Congress from Pennsylvania, died November 13, 1910. He was born in Frankford, Philadelphia, in 1846 and was educated at the public and private schools of that city. He was engaged in business and was president for twelve years of the Philadelphia Trades League. He was also a member of the Citizens' Permanent Relief Commission. He was elected to the 60th and 61st Congresses 1907 and 1911.

**FOUNDATIONS.** During the year 1910 there was completed one of the most interesting and difficult foundation projects recorded in engineering literature. This foundation was designed to carry the large municipal building of the City of New York which in its lower floors serves as a subway station. This building rises 337 feet above the curb with twenty-five stories and a tower carried fifteen stories higher or 560 feet above the street. It has a frontage of 381 feet on Centre Street and a total depth of 173 feet; so that its size and weight may be appreciated. To carry the weight of such a structure, ordinarily it would be necessary to carry the foundations for the supporting columns down to bed rock, which at this particular point of Manhattan Island is at a depth of from 144 to 178 feet below street level. Obviously such foundations had to be constructed with the use of pneumatic caissons in which air pressure is maintained as the material is excavated. A limit of 50 pounds is placed by law on the caisson air pressure in which workmen are permitted and this was reached when a point 115½ feet below tide level was arrived at. After considerable investigation the decision was reached by the engineers of the Department of Bridges of the City of New York in charge of the construction of the building and the builders, that it would be possible to use as a bearing surface the sand itself overlying the bed rock, particularly if the feet of the supporting foundations could be enlarged so as to present a greater bearing surface.

Accordingly the greatest depth to which any single caisson was sunk was 112 feet 1 inch below the tide level or 144 feet below the street level. As the material in which these foundations have been excavated varies in character and position, differences in construction have been permitted. Where the rock was sufficiently near the surface the caissons were sunk direct to bed rock, and where these were too far distant broad concrete foundations bearing on sand with a conservative maximum pressure of six tons to the square foot were sunk. The average depth of these foundations was 72 feet below the curb. This particular class of foundations was required for that portion of the building north of the main tower, below the north wing, but for the south wing no particular difficulty was encountered and 68 caissons ranging in size from 19 by 19 feet square to 6 feet in diameter were

carried down to bed rock to an average depth below the street of 136 feet. Working chambers made of reinforced concrete, timber and steel were used in building the foundations and in these workmen excavated the sand while under pressure and passed it up through steel shafts and air locks. The working chamber and the shaft were then filled with concrete so that foundation piers absolutely monolithic and reinforced by steel rods were formed.

These foundations were the deepest ever built by the pneumatic process and represented an outlay of \$1,443,000, this being the contract price for the work.

The superstructure will cost \$5,598,000. As illustrative of the improvement made in caisson operations it may be stated that but two cases of the "bends" occurred and there was no loss of life from caisson disease. Physicians were constantly in attendance and a hospital was maintained so that the capacity of each workman for labor under various pressures could be determined by frequent examinations. Incidentally, it may be observed that along Park Row extreme care had to be used in supporting and then underpinning the structure of the elevated railroad, under the columns of which concrete bases were built to a depth of 42 feet below street level. Furthermore, as the floor of the subway in Centre Street is 12 feet above the lowest level of the building, it also had to be supported as well as protected laterally by sheet piling while work on the foundations was in progress.

**FOUNDATIONS FOR KINZIE ST. (CHICAGO) DRAWBRIDGE.** In replacing the drawbridge carrying the tracks of the Chicago and Northwestern Railway over the Chicago River at Kinzie Street, the trunnion pier for the new bascule bridge had to be located where bed rock was at great depth, 94 feet below the bottom of the river. The pier is a large one, as the new lift bridge is a Strauss through riveted truss 170 feet long and carries two tracks. Caissons were put down under air pressure 51 feet below Chicago city datum, and 29 feet below the river bed. From the bottom of these caissons, wells 10 feet in diameter were sunk 65 feet, at which level rock was reached and the wells were filled up with concrete. The main pier was then built up on these, resulting in an entirely satisfactory foundation. Permanence of the completed work was imperative, as this is one of the busiest railway lines entering Chicago over the river. See also BRIDGES.

**FOURTH OF JULY ACCIDENTS.** See TETANUS.

**FOWLER, FRANK.** An American artist and writer on art, died August 18, 1910. He was born in Brooklyn, N. Y., in 1852 and was educated by private teachers and at Adelphi Academy, Brooklyn. He studied for two years at Florence and for six years at Paris under Carolus Duran and at the Ecole des Beaux Arts. He established himself in New York in 1880 and became well known as a portrait painter. He painted portraits, among others, of Mme. Modjeska, Charles A. Dana, A. T. Hadley and William Dean Howells. He was awarded a medal in Paris in 1889, Atlanta, 1895; Buffalo, 1891, and Charleston, 1901. In 1889 he was made a member of the National Academy. Among his writings on art subjects are *Oil Painting, Drawing in Charcoal and Crayon, Portrait and Figure Painting*. He contributed also articles on art to the various magazines.

**FOX, JAMES D.** An American jurist, died October 6, 1910. He was born at Frederickstown, Mo., in 1847 and was educated in the public schools and at St. Louis University, which he attended in 1864-5. He was admitted to the bar in 1867 and practiced law in Frederickstown. From 1880 to 1902 he was circuit judge of the 27th judicial circuit of Missouri, and from 1903 to the time of his death he was associate justice of the supreme court of Missouri.

**FRANCE.** A republic of Western Europe, made up of 87 departments (including Belfort). Capital, Paris.

**AREA AND POPULATION.** Area, 536,464 square kilometres (207,129 square miles). Population in 1901, 38,961,945; in 1906, 39,252,267. Marriages in 1908, 315,928; divorces, 11,515; living births, 791,712; still-births, 37,154; deaths, 745,271. Surplus of births over deaths, 46,441; in 1907 the deaths exceeded the births by 19,890. Paris had (1906) 2,763,393 inhabitants; Marseilles, 517,498; Lyons, 472,114; Bordeaux, 251,917; Lille, 205,602; Toulouse, 149,438.

**EDUCATION AND RELIGION.** As the three departments of Algeria are for administrative purposes included with those of France, official statistics frequently include both countries. The following table shows the condition of the various classes of establishments, on dates named, in France and Algeria, excepting in instances marked F, which are for France alone:

	Schools	No. Teachers	Pupils
Infant schools, 1907-8...	3,391	8,449	631,287
Primary, lay " ....	80,319	147,996	5,448,481
" clerical " ....	1,323	4,397	151,560
Lycées—1909:			
Boys .....	111	.....	60,548
Girls (F.) .....	48	.....	17,448
Colleges .....	293	.....	47,044
Private—1908 .....	627	.....	64,558
Students in state universities in 1909..			41,897

There are special and technical schools and colleges of all kinds; normal schools; schools of art and science; and military, naval, and commercial institutions.

The state recognizes no religion. The question of pensions and allowances to be paid (as a transitory measure), under the law of December 9, 1905, to the Roman Catholic clergy remains unsettled, the Church refusing to recognize the fact of separation. Total estimated expenditure for worship for 1910, 497,800 francs (310,000 for assistance to the clergy and their families).

**AGRICULTURE.** Of the 36,977,098 hectares (last census report) under crops, grasses, and fallow, the following table shows the area devoted to cereal and root crops in the four years past, in thousands of acres (2.471 acres in a hectare):

	1907	1908	1909	1910*
Wheat .....	16,246	16,221	16,300	16,120
Oats .....	9,559	.....	9,703	9,672
Rye .....	3,063	3,075	3,032	3,061
Barley .....	1,760	.....	1,815	1,843
Maslin .....	356	353	350	341
Potatoes .....	3,761	3,819	3,824	3,766
Sugar beets .....	542	551	585	576

\* Preliminary estimate of the French Ministry of Agriculture.

The yield is seen in thousands of Winchester bushels:

	1907	1908	1909	1910 *
Wheat .....	365,372	317,765	356,193	268,364
Oats .....	294,497	.....	331,183	316,133
Rye .....	54,169	51,703	54,934	48,212
Maslin .....	6,843	6,465	5,619	5,722
Barley .....	41,712	.....	46,144	44,532
Potatoes .....	512,229	625,014	613,041	308,885
Sugar beets† .....	5,730	6,396	6,894	5,702

\* Preliminary estimate of the French Ministry of Agriculture. † In thousands of tons (2000 pounds).

The potato yield per acre, which in 1908 and 1909 had averaged over 160 bushels, was in 1910 only 82 bushels, owing to unfavorable weather conditions. The wheat crop also suffered and heavy imports will be required to make up the deficit in these and other staples. Winter cereals have been seriously damaged by fall rains, and the outlook for the coming crops is scarcely more hopeful than at the same period the preceding year, which is reported as one of the most disastrous years agriculturally in the history of the country.

Besides the area planted to sugar beets, over 1,500,000 acres in 1910 were devoted to the production of beets for feeding purposes, and about 130,000 to beets for distillation. Yield: for feeding, 23,123,000 tons (14.47 per acre), against 25,529,000 (15.63) in 1909; for distillation, 2,094,000 tons (16.17 per acre), against 2,171,000 (17.88) in 1909. Area sown to corn in 1907, 1,236,000 acres; production, 23,284,000 bushels (24,000,000 bushels in 1908). Buckwheat, 1,243,000 acres; 20,585,000 bushels. Meadows and permanent pastures, 13,346,000 acres; hay and grasses crop, 402,898,000 cwt. Olives (about) 328,648 acres, 125,000 tons. Vineyards, in 1907, 4,073,930 acres, 1,272,854,000 gallons; in 1908, 4,086,120 acres, 1,331,900,000 gallons; in 1909, 4,013,490 acres, 1,197,810,000 gallons. Total sales from the champagne district, year ending March 31, 1910, 39,294,526 quarts; 1909, 32,705,338. Cider production: 1907, 88,150,000 gallons; 1908, 439,500,000; 1909, 214,610,000. The vineyards, orchards, and gardens were seriously damaged by cold weather and continued heavy rains during the agricultural year 1910, and scarcity and high prices have resulted. Livestock (beginning of 1908): 3,094,698 horses, 191,715 mules, 361,073 asses, 13,949,722 cattle, 17,460,284 sheep, 6,995,124 swine, 1,421,009 goats. Silk culture is encouraged by the government and is carried on in 24 departments. Cultivators (1907), 124,463; eggs put in incubation 188,360 ounces (of 25 grams); total production of cocoons, 8,396,201 kilograms.

MINING AND METALS. The output and value of mining products in 1908 were as follows:

	Tons	Francs
Coal .....	36,633,000	584,341,000
Lignite .....	751,000	8,002,000
Bituminous .....	171,000	1,357,000
Iron ore .....	10,057,000	45,538,000
Copper .....	760	20,000
Lead .....	13,400	2,463,000
Zinc .....	52,600	4,225,000
Iron pyrites .....	285,000	4,460,000
Sulphur .....	2,200	42,000
Manganese ore .....	15,900	380,000
Antimony .....	26,000	1,844,000
Arsenic .....	2,381	60,000
Wolfram .....	113	266,000
Salt .....	708,784	10,849,817

The output of mines and furnaces is given below in metric tons:

	1907	1908	1909
Coal and lignite.....	36,753,627	37,384,384	38,071,758
Iron ore.....	9,196,474	10,057,000	.....
Pig iron.....	3,590,200	3,400,771	3,632,105
Iron & steel, mfd.....	580,000	.....	.....
Steel, worked.....	1,860,300	.....	.....

Value of 1907 output from all quarries, 248,183,265 francs.

OTHER INDUSTRIES. The manufacturing industries employ (according to the 1901 census) 5,819,855 persons; extractive industries, 266,351; fishing, 67,772. The sugar works (251 in 1908-9) employed 33,623 men, 1866 women, 1134 children. Sugar yield, 723,081 tons, against 656,832 in 1907-8. Alcohol produced 1908, 55,836,000 gallons, against 55,326,000 in 1907. The state match monopoly yielded in 1908 a net profit of 29,453,964 francs; there were 6 factories, employing 683 men and 1219 women. Sales of manufactured tobacco (1908), 40,289 metric tons; profits of the monopoly (state), 389,735,000 francs. Value of fishing products in 1905, 122,891,036 francs.

COMMERCE. The trade for three years is given in thousands of francs:

	1907	1908	1909
Imports, general.....	7,874,600	7,180,400	.....
" special.....	6,223,000	5,640,500	5,972,618
" prec. mets..	805,000	1,189,000	.....
Exports, general.....	7,256,100	6,620,300	.....
" special.....	5,591,100	5,050,700	5,511,638
" prec. mets..	371,000	199,000	.....

Imports and exports of raw materials (1909), 3,888,501,000 and 1,562,412,000 francs respectively; manufactures, 1,156,113,000 and 2,684,722,000; food-stuffs, 928,004,000 and 811,703,000; exports by parcels post, 452,801,000. Principal articles of the 1908 special trade are given, with their value in thousands of francs:

Imports	1000 fr.	Exports	1000 fr.
Wool .....	549,000	Cottons .....	281,100
Coal .....	391,200	Silks .....	270,200
Cotton .....	389,900	Wool .....	228,600
Silk .....	279,900	Skins .....	217,900
Seeds (oil).....	253,700	Wine .....	196,800
Skins .....	239,700	Woolens .....	196,100
Machines .....	221,800	Articles de Paris.....	183,900
Timber .....	206,300	Novelties .....	145,600
Copper .....	138,900	Silk .....	133,900
Wine .....	116,500	Automobiles .....	127,300
Rubber .....	115,200	Clothing .....	123,800
Coffee .....	104,300	Chem. prods.....	122,000
Cereals .....	97,000	Metal wares.....	110,000
Minerals .....	87,900	Machines .....	92,500
Petroleum .....	86,900	Paper .....	84,800
Nitr. soda .....	83,800	Sugar .....	81,400
Flax .....	79,600	Glass, etc.....	80,200
Feathers .....	78,100	Butter, cheese... ..	79,300
Cellulose .....	77,000	Iron & steel.....	77,800
Dairy prods.....	62,400	Leather goods....	68,000

Principal countries of origin and destination, with value of trade (1908) in millions of francs:

	Imps.	Exps.		Imps.	Exps.
Gr. Brit.....	793.9	1,183.3	Italy .....	164.8	242.1
U. States.....	657.1	314.7	China .....	138.0	9.7
Germany .....	607.5	617.1	Switz .....	115.3	314.9
Belgium .....	409.5	749.2	Brazil .....	114.5	48.1
Algeria .....	273.1	399.0	Chili .....	103.4	20.4
Br. India.....	263.4	18.0	Neth'l'ds .....	100.2	56.0
Argentina .....	257.8	111.6	Turkey .....	88.4	64.5
Russia .....	239.6	72.8	Ind.-China.....	82.3	70.1
Spain .....	148.7	128.2	Aus.-Hun. ....	70.3	42.4

SHIPPING. The navigation at French ports is shown for 1908:

	Entered		Cleared	
	Vessels	1000 tons	Vessels	1000 tons
Coasting .....	77,624	7,894	77,624	7,894
Foreign trade.....	8,478	6,588	8,466	6,698
Total French.....	86,102	14,482	86,090	14,592
Foreign ships.....	22,073	21,163	22,222	21,221
Total .....	108,175	35,645	108,312	35,813

The merchant marine (December 31, 1908) contained 15,768 sailing vessels of 648,211 tons net, and 1608 steamers of 804,282.

**COMMUNICATIONS.** Length of railway lines open for traffic December 31, 1909, 40,433 kilometres of main lines, 8349 of local lines. On January 1, 1909, the Western railway system was acquired by the state. Length of telegraph lines (1908), 177,520 kilometres; wires, 972; telegraph offices, 14,880 state, other, 3582; 972; telegraph offices, 14,880 State, other, 3582; post-offices, 13,258.

Navigable rivers (1908), 5480 miles; canals, 3075. Length of roads (1907), 23,710 miles national, 38,830 vicinal.

**FINANCE.** The monetary unit is the franc, worth 19.3 cents. The revenue and expenditure are given for three years, below (1909 and 1910 estimates):

	1907	1909	1910
Revenue .....	3,968,367,131	4,041,494,081	4,182,828,225
Expend .....	3,880,240,263	4,041,271,697	4,185,382,482

Principal estimated sources of revenue and items of expenditure for 1910 (act of April 8, 1910):

Rev.	1000 fr.	Exp.	1000 fr.
Direct taxes...	582,948	Debt .....	1,269,367
Domains .....	70,089	Pres. & leg....	20,027
Ind. taxes a....	2,291,144	Ministries c ...	2,292,350
Monopolies b ...	911,954	Admin'n'd .....	559,403
Various .....	160,280	Repayments ...	44,235
Exceptional ...	68,541		
Rec. d'ordre....	98,232		
	4,182,828		4,185,382

(a) Registration, 692,470,300 francs; customs, 510,049,000; stamps, 197,921,300; sugar, 159,183,900. (b) Matches, 550,478,700; posts, 92,380,500. (c) War, 872,150,505; Marine, 375,575,477; Instruction and Fine Arts, 302,714,027; Public Works, Posts and Telegraphs, 265,044,667; Interior and Worship, 161,600,191; Colonies, 101,039,434; Commerce and Industry, 57,128,182; Justice, 39,128,800; Agriculture, 34,819,058; Foreign Affairs, 19,630,625. (d) Costs of administration and collection of taxes.

It is notable that while the budgets as voted show on the average a small surplus, the actual average deficit is large. To the budget of 1910 is annexed a statement of the deficits of the ordinary budgets from before 1814 to end of 1908, a total of 1,087,473,140 francs, which is still not representative of the difference between ordinary revenue and total expenditure.

The national debt has increased from 718.2 millions of francs in 1800 to 1282.7 millions in 1815, 5959.8 millions in 1848, 12,549.6 millions in 1871, 30,633.12 millions in 1909; and the interest, from 37.8 millions in 1800 to 1272.6 millions in 1909. The capital of the debt (exclusive of annuities, which do not figure in the official statement of the national debt), Jan. 1, 1910, stood at 31,432,175,630 francs; floating debt, 1,432,180,600.

The Bank of France is the sole bank of issue.

It stood, Jan. 13, 1910, as follows: Cash, 4,361,127,000 francs; portfolio, 1,030,136,000; advances, 714,406,000; securities and real property, 258,002,000; capital and reserve, 215,018,000; notes in circulation, 5,384,860,000; accounts current, 668,529,000. The national savings banks had, Dec. 31, 1908, 5,291,673 depositors, with deposits amounting to 1,538,678,067 francs; other savings banks, 7,914,871 depositors, 3,689,100,132 francs deposits.

**ARMY.** Personal military service in France is obligatory on every citizen between the ages of 20 and 45, and involves two years' service in the active army, 11 years in its reserve, 6 years in the territorial army and 6 in its reserve. The reservists and the territorial soldiers receive periodical training. The recruitment of the army was an important question in France, as on account of the declining birth rate the annual contingent forthcoming was progressively declining and in 1909 it had fallen to 207,000 from an average of 215,000 in the decade 1896-1905. By 1912 it was expected that the annual quota would be reduced to 204,000 and that in 10 years the total decline would amount to some 34,000 men lost to the army, which would mean that in 20 the strength of the army would be diminished by four army corps. Consequently in 1910 it was seriously proposed to enroll native and black troops in the colonies and dependencies as a part of the regular army and a battalion of Senegalese rifles so formed was sent to Algeria in 1910.

The active army (1910) had an establishment of 28,532 officers and 552,959 men for the active army itself and Saharan troops, and in addition there were 677 officers and 24,135 men in the gendarmerie and republican guard. The organization of the active forces embraces 20 army corps, each of which occupies one of the military districts into which France is divided. This is exclusive of the Paris garrison and the forces in Tunis. The corps headquarters are at Lille, Amiens, Rouen, Le Mans, Orléans, Châlons-sur-Marne, Besançon, Bourges, Tours, Rennes, Nantes, Limoges, Clermont-Ferrand, Lyons, Marseilles, Montpellier, Toulouse, Bordeaux, Algiers, Nancy. The active army had about 590 battalions of infantry, 30 battalions of chasseurs, 12 foreign battalions, 24 battalions of zouaves, 24 of Algerian tirailleurs, 1 Saharan tirailleurs, and 5 African light infantry, making a total of about 685 battalions. Reorganization of the infantry was under discussion in 1910 and this was expected to change the number and constitution of the various regiments into which these battalions were being grouped. The cavalry in 1910 comprised 31 regiments of dragoons, 21 of chasseurs, 14 of hussars, 13 of cuirassiers, 6 of chasseurs d'Afrique and 4 of spahis, each made up of 5 squadrons, in addition to 2 squadrons for the Sahara and a few squadrons of colonial troops. It was in the artillery that the greatest changes were taking place, as the reorganization provided by the law of 1909 was in full progress and was to be completed within two years. The new force thus constituted was to consist of 42 coast and 47 fortress batteries, 619 four-gun field batteries, 21 Rimailho 6-inch field howitzer batteries, 14 mountain batteries, and 16 horse batteries. On foreign service there would be 8 coast, 15 field and 4 mountain batteries. There were being organized 195 new field batteries, of which 36 were obtained by the transformation of horse batteries, while 94 were new organizations

and 65 remained to be created. The entire reorganization was expected to be completed by 1911. The engineers in the active army numbered 26 battalions, there were 3 railway companies with other technical troops and a military train of 72 companies forming 20 squadrons.

The last available returns of the strength of the active army by arms were as follows:

	France.	Algeria and Tunis.
Infantry .....	332,845	43,200
Cavalry .....	56,764	8,450
Artillery .....	76,936	3,875
Engineers .....	12,250	1,118
Train .....	10,560	1,850
Total .....	489,355	58,493

In addition there were 2200 non-commissioned officers and 13,000 men in the administrative troops, 4000 officers unattached, 420 officers and 3220 men in the military schools, and 2400 officers and 480 men supernumerary.

The reserve of the French army is organized into 245 three-battalion regiments of infantry with a skeleton organization which can be filled in time of emergency, 30 battalions of chasseurs, 40 regiments of cavalry, 41 squadrons, and 216 batteries. The territorial army comprised 145 regiments of infantry, 7 battalions of chasseurs, 42 squadrons of cavalry, about 100 field batteries, 20 battalions of engineers, and various miscellaneous civil, foreign and other troops. In 1910 the budget showed a considerable increase over that of 1909, due to the reorganization of the artillery, increases in pay and other reforms resulting from legislation. The total war effective strength of the French army continued in 1910 as in the previous year at about 2,350,000, to which could be added another million of men that could be placed in the field in time of war.

During the year specifications for a new automatic rifle were issued and considerable experimentation with various types was under way with an ultimate view to the re-armament of the entire army.

**NAVY.** In 1910 the larger vessels of the effective navy were: Battleships 18 (8 first-class), detailed as follows: one of 18,320 tons (the *Voltaire*, completed 1910); six of 14,865 tons each; one of 12,728; one of 12,205; one of 11,924; three of 11,260 tons each; one of 11,986; one of 11,882; one of 11,824; one of 10,983; one of 8948. Armored cruisers, 21 (13 first-class): one of 14,000 tons (the *Edgar Quinet*, completed 1910); one of 13,644 (the *Ernest Renan*, completed 1909); one of 12,750; three of 12,550 tons each; four of 10,000; three of 9516; three of 7735; one (1903) of 11,270; one of 6300; one of 5365; two of 4750. There were building in 1910: first-class battleships: two of 23,600 tons each, and five of 18,320; first-class armored cruisers, one of 14,000 tons. The number of effective warships of 1000 tons and over, and of torpedo craft of 50 tons and over, built and building (actually begun) in 1910, was 448, of 725,231 aggregate tons displacement, detailed as follows: 24 battleships (10,000 tons and over), aggregating 358,050 tons; 3 coast-defense vessels, 17,190; 22 armored cruisers, 211,070; 3 cruisers (over 6000 tons), 24,022; 8 cruisers (6000 to 3000), 33,527; 2 cruisers (3000 to 1000), 4706; 79 torpedo-boat destroyers, 31,

386; 227 torpedo boats, 21,584; 80 submarines, 23,696. The naval appropriation for 1910 was \$73,011,872; for 1909, \$64,899,589; for 1908, \$62,194,916; and the total naval expenditure, from 1900 to end of 1910, was placed at \$700,770,859. Personnel, 2879 officers and 53,900 men.

**GOVERNMENT.** The executive authority is vested in a president, elected for seven years by the National Assembly; he is assisted by a cabinet responsible to the Chamber. The National Assembly (the legislative body) is composed of a senate and a chamber of deputies. The members of the Senate (300) are elected indirectly for nine years, those of the Chamber (584) by universal suffrage for four years. The President (1910), Armand Fallières, was born Nov. 6, 1841, and was elected Jan. 17, 1906. The Cabinet, as constituted Nov. 3, 1910, was composed as follows: Premier, Minister of the Interior and of Worship, Aristide Briand; Justice, Théodore Girard; Foreign Affairs, Stephen Pichon; Finance, L. Klotz; War, General Brun; Marine, Admiral Boué de Lapeyrière; Instruction and Fine Arts, M. Maurice-Faure; Public Works, etc., L. Puech; Commerce and Industry, Jean Dupuy; Agriculture, M. Raynaud; Colonies, J. Morel; Labor, etc., L. Lafferre.

#### HISTORY

**TARIFF REVISION.** Tariff revision was discussed in the Senate early in March, when the committee in charge of the measure submitted its report. This report favored the proposed increase of duties on imports of manufactured articles, and the readjustment of the schedule of duties, but it declared that revision should be limited to the redress of the balance which had been disturbed by changes in the foreign tariffs since the French tariff of 1892 had gone into effect. Some fear of a tariff war with the United States was aroused, but negotiations with that country led to a settlement whereby the minimum tariff of each was to be granted to the other. The bill granting the French minimum to the United States passed the Chamber at the end of March. Meanwhile the tariff measure, as modified by the Senate, passed the Chamber and went into force on April 1. On the whole, the counsels of the moderate revisionists prevailed and the changes were made in a conciliatory spirit. Both the Protection and the Free Trade parties believed that a revision was necessary, but it was thought best that the modifications of the tariff of 1892 should be merely such as would meet the changes in the tariffs of foreign countries. It was held that the results were not such as to give any foreign government an excuse for retaliation. Nevertheless, it was regarded generally as a high protective measure in spite of the claim that it was merely a measure of economic defense. As passed by the Chamber its character was highly specialized and provided for a great number of concessions to foreign nations.

**OLD AGE PENSION ACT.** During January, February and March the Old Age Pension bill was discussed in the Senate and finally passed that body with amendments on March 22. The main features of the measure were as follows: To secure a state pension it was necessary that the man or woman applying should be 65 years of age and a wage-earner for at least 30 years. It provided for a compulsory contribution from

both the wage-earner and the employer; for men, 9 francs a year; for women, 6 francs; for boys under 18, 4 francs, and the same amounts respectively for the employers. In addition to the pension which they would receive from this source the state contributed an annuity or *viagère*, beginning at the age of 65. At the age of 55 a workingman might receive a pension at a proportionately reduced rate, but without the *viagère*. The pensions were very small. At best, the workingman's compensation at the age of 65 would be not more than 414 francs, including the state annuity of 60 francs. It was estimated that an old age pension administration would cost about \$27,500,000, which was to be made up of funds derived out of the revenue from the succession duties. The Old Age Pension bill, as modified in the Senate, received the assent of the Chamber on March 31. It was to go into effect Jan. 1, 1911.

**REFORM OF JUDICIAL PROCEDURE.** Early in January a bill for the reform of judicial procedure was under discussion. While the general spirit of it was approved, some of the terms of it were not wholly satisfactory. Its friends declared that the aim of the measure was not to call into question the impartiality of the bench, but to free the judge from the danger of drawing too hasty impressions as to the innocence or guilt of the accused. The bill accomplished this in their estimation by suppressing the interrogatory. The indictment had hitherto been the basis of the cross-examination of the prisoner and it was held that this was unfair since the prisoner ought not to be cross-questioned from evidence which had not yet been given in court. On January 11 the Minister of Justice authorized the introduction of the bill, which had been drafted by the extra-parliamentary commission appointed in 1909. In general, it abolished cross-examination by the presiding judge and provided that in criminal cases the public prosecutor should make a preliminary statement of the charges. It also established certain additional rules concerning the examination of witnesses and it gave the judge discretionary power to deal with the demand of the prisoners for witnesses when the prisoners were without means.

**SCHOOL QUESTION.** On January 14 the government was interpellated in the Chamber on the school question and an important debate followed. It dealt with the attitude of the bishops toward the state and the free schools, and the question which had been raised as to the impartiality of school teachers in imparting moral instruction. It also involved the question as to state control over private schools. Roman Catholic deputies charged the government with having disregarded neutrality in the teaching of pupils, denounced the system of primary education, and urged the Catholics to resist the government's policy of "obligatory free-thinking." The Radical position was that primary schools ought not to teach anything that any man in his senses could challenge and that the idea of God ought not to be discussed in the schools. The debate turned also on the action of the bishops who had prohibited the use of certain manuals in the free schools. Their action was defended by the Abbé Gayraud and the Catholics argued that the free schools ought to be subsidized by the government. On this occasion the Premier commented on the hostile attitude of the church, declaring that it wanted

war, and saying that the attack on the schools proceeded from the enemies of France who were concentrating against the government. He declared that the government would lose no time in defending itself from these attacks. On January 24 the debate ended with a vote of confidence of 385 to 137. In January Cardinal Luçon, Archbishop of Rheims, was tried in a suit brought by the School Teachers' Association for his action as to certain text-books. He declared that he had merely warned parents that the text-books prescribed by the government might impair the religious training of their children, but he was sentenced to pay a fine of 500 francs and costs. A similar suit against the Archbishop of Nancy was dismissed.

**THE DUEZ SCANDAL.** Charges of certain abuses having been made against the liquidators of the religious associations under the Associations Law, a Senate Committee was appointed to investigate their methods in 1907. It soon became evident that the officials had been guilty of irregularities. Ex-Premier Combes was especially active on the commission and had often referred to the excessive fees charged by the liquidators. A report of the commission, published early in 1910, justified these charges and called upon the Minister of Justice to put an end to such practices and punish those liquidators who had misused their opportunities for personal gain. The case of M. Duez soon afterward became public. He had resigned on the ostensible ground of ill health; and upon investigation of his accounts a certain item, amounting to 2,000,000 francs, the receipts for the sale of Stanislaus College, could not be traced. When asked to explain, M. Duez repeatedly deferred his answer, but finally on March 7th appeared before the new judicial liquidators appointed by the government and made a full confession, declaring that he had misappropriated even more than they had suspected. His defalcations in private funds and in religious property were estimated at 5,000,000 francs. M. Jaurès sharply censured the government for its delay in taking action, saying that had they proceeded against M. Duez two years earlier he would have confessed his guilt as well then as now. He called on the Chamber to defeat the Ministry. M. Briand declared in reply that the government had acted as vigorously as possible, and that in the affair of Grande Chartreuse in regard to which it had been criticised the government could not act sooner because the case was in the courts, but if crime were revealed it would take prompt action. He called on the Chamber for a vote of confidence, which was granted with acclamation. The result of the liquidation scandal was the introduction of a bill for the dismissal of the present liquidators and the transfer of their duties to the director-general of the public domain, allowing the dismissed officials three months in which to put their accounts in order. The measure was carried toward the end of March.

**THE VATICAN AND MODERNISM.** The Pope continued to maintain the same general attitude toward modernism that had been shown in the recent succession of Encyclicals. In a letter addressed to the French cardinals, archbishops and bishops, published in August, the Pope condemned the organization known as the Sillon, a group of Christian Democrats among the young Roman Catholics, organized during

the pontificate of his predecessor. Their object was to reconcile the people with the Roman Catholic Church, and although they did not definitely announce themselves as Republicans, their language pointed to this and marked them off from the reactionary members of the Roman Catholic Church in France. The strictly orthodox element finally prevailed upon the Pope to pronounce against them. His letter condemns the independent course taken by the Sillon Society and accuses its members of trying to apply the philosophy of the 18th century by destroying class distinction and suppressing authority, thus upsetting the natural and historical foundations of society. The agitation can, he says, benefit only Socialists. It is contrary to the traditional policy of the church and it is based on the error that religion may be allied with a political party, that is, the Democracy, as that party was especially favorable to the church, and he warned the French priesthood against this mirage of a false democracy and urged them not to use the language of their enemies, "emphatic utterances full of promises, which are as sonorous as they are impracticable." He added that "the real friends of the people are neither revolutionaries nor innovators, but traditionalists."

Another measure which caused ill feeling among the advanced churchmen in France was the decree fixing the date of the first communion at about the age of seven. This change caused much concern among many of the priests, for in France it had become a strongly entrenched national custom that the child should partake of its first communion at an age sufficiently advanced to mark its entrance into the conscious life of the family. The dissatisfaction caused among the clergy by changing the date of the first communion was prompted in part by the fear that the only means of securing a religious education of the young might thus be destroyed. Another cause of discontent in the priesthood was the announcement that the Vatican was about to consider the issuing of a decree refusing Christian burial to any person who had not confessed and received communion at Easter.

**PARIS FLOODS.** One of the worst floods in the recent history of France occurred in January, 1910, owing to the heavy rains and the rising of the various rivers. The valleys of the Marne, Loire, Indre, Aube, Yonne, Aisne, Meuse, Moselle and Doubs were soon flooded. The Yonne and Marne rose at the same time, and before their waters subsided a heavy rain in the valley of the Yonne caused a second rising, which swelled the waters of the Seine and so caused the flooding of Paris. By January 23 the waters had submerged many of the electric and hydraulic power stations in the city and caused great damage to the electric light plants and the railway system, especially the underground electric railways. Considerable loss of life was reported in the provinces and the railways were rendered useless in many districts, extensive lines of track being submerged and many bridges and dikes carried away. In the last week of January it was reported that nearly half of the country was under water and the floods were still rising. In Paris the Seine rose so high that soon hardly any daylight was visible through the arches of the bridges and their parapets were only a few feet above the water. On January 26 the Seine was 26 feet deep at the Pont Royal and the water

was still rising. On January 29 it reached its highest point, 31 feet, and thenceforth gradually subsided. There have been serious floods in Paris in very early times. A noteworthy flood was that of 1615, when the depth at the Pont Royal was recorded as 32 feet. In the 19th century the water rose to an alarming height on 10 occasions, the most serious flood occurring in 1876. But the depth at the Pont Royal in the present flood exceeded that recorded for 1876. In Paris it was reported that 200,000 persons were in distress, many being driven from their homes. Nearly one-half of the city streets and squares were under water and most of the others had water under them. The government acted with great vigor. Large bodies of troops and civilians were employed in building dikes to hold back the water. At one time the Chamber of Deputies was almost surrounded by a lake and the riverside along the Champs Élysées to the west of the Place de la Concorde was under water. On the 28th the waters reached as far as the Boulevard des Italiens. Many of the streets were closed, and eight out of the ten bridges. Considerable damage was done to the Louvre. On January 30, M. Briand declared that the situation was improving. The authorities were successful in suppressing the ravages of the disorderly element and in carrying on the work of relief. The state supplied considerable sums for relief work and much was derived from the generosity of foreign governments. The losses throughout France were roughly estimated at from \$200,000,000 to \$300,000,000. In his speech on February 9 the Premier summed up the results of the flood, and in so doing referred to the fact that it had revealed a feeling of unity among all classes in France, as well as a strong spirit of self-sacrifice. Party differences were sunk in the presence of a great calamity and all classes worked together for the prevention of further damage and for the relief of distress. He also referred to the generosity of foreign nations and the good work done by the Red Cross Society.

**THE ELECTIONS.** Parliament adjourned on April 8 to meet on June 1, and the elections were held in the two weeks following April 24. M. Briand opened the campaign by a speech at Saint Chamond, in which he defended the government's policy toward the church, saying that it had entered upon its course for the separation of Church and State not in a spirit of hostility but of liberty and tolerance and that it did not desire to prosecute anyone but aimed at peace and conciliation. As to the political programme for the future Parliament he mentioned the following features: Electoral reform, administrative reform, extension of the legislative mandate, the statute of functionaries prohibiting their right to strike and freeing them from the influence of politicians. His speech was interrupted by a violent outbreak on the part of Socialists, who threw stones into the banquet hall. The chief matters discussed in the campaign were the conflict between the clergy and the government on the question of education, the new taxes in M. Cochery's budget, secret ballot, proportional representation, and naval improvement. The elections showed an increase in the strength of the Socialists and of the Republicans of the Left. The Radicals and Radical Socialists were reduced from 269 in the former Parliament to

252. The Reactionaries, however, were cut down considerably, being 80 in the Parliament that had just closed and 71 in the new body. The figures as published soon after the election, with official sanction, but criticised by some of the groups as incorrect, were as follows: Reactionaries, 71; Nationalists, 17; Progressists, 60; Republicans of the Left, 93; Radicals and Radical Socialists, 252; Independent Socialists, 30; Unified Socialists, 74. In the previous Parliament the Independent Socialists had numbered only 29 and the Unified Socialists, 55. The personnel of the new Chamber was greatly changed, 235 new deputies having been chosen.

Parliament met on June 1, and M. Brisson was elected President of the Chamber. On June 9, M. Briand outlined the ministerial policy. As to electoral reform he said that it must aim to place general interests above local by means of an enlarged ballot, the *scrutin d'arrondissement* having resulted in abuses. It was not only just but essential in parliamentary government that while the majority had the preponderance to which it was entitled, the views of the minority should make themselves known. The reform also aimed at the renewal of the Chamber by thirds and with a longer mandate. He also referred to the need of an income tax, improved budget methods, judicial and administrative reforms, an adequate naval measure and of granting corporate rights to trade unions. Little legislation was finished during the summer session. The Electoral Reform bill was presented on June 30. The plan comprised three changes, namely, a return to the *scrutin de liste* in place of the present *scrutin d'arrondissement*, proportional representation, and renewal of the Chamber by sections every two years, each deputy to hold his office for six years. The budget for 1911 was presented on June 28. The revenue was estimated at \$850,000,000, the deficit at \$40,000,000, to meet which were proposed higher taxation of estates of persons with fewer than three children, and higher registration and stamp duties. The need of reducing expenditures was strongly urged. The government also introduced its bill providing for the corporate responsibility of trade unions. The latter might make collective contracts with employers, were to be liable to actions for damages for breaches of such contracts and were to be both corporately and individually responsible. Parliament adjourned on July 12 to meet on October 25.

**THE ROCHETTE AFFAIR.** In March, 1908, M. Rochette, a banker, was arrested on the charge of embezzlement and the promotion of swindling schemes. It was alleged that the arrest was due to the action of private persons, who, although they themselves had no ground of complaint, were instigated by the police to start judicial proceedings. The Prefect of Police was sharply criticised for departing from regular judicial action and hunting for a plaintiff outside, and it was said that he had received instructions from the late Prime Minister, M. Clemenceau, who was charged with practically reviving the principle of the *lettre de cachet*. This caused an interpellation in the Chamber by MM. Jaurès and Leboucq on July 11. M. Jaurès made a violent attack on the Prefect of Police, whom he accused of illegal plots for the purpose of accomplishing the prisoner's arrest. M. Briand defended the Pre-

fect, saying that the judicial authorities could not prosecute except on the basis of a formal plaint, and that M. Lepine had merely done his duty in seeking among the numerous victims of Rochette someone who would assume responsibility for a formal charge. M. Jaurès had said that the police were in collusion with a man who had presented a false plaint. M. Briand replied that he had no right to say this unless he could bring proof. The affair brought up the old question of legal stock exchange speculations. It led to the repeated charge that certain persons associated with the government had been speculating at the Bourse on the basis of the evils which would result in their own exposures of M. Rochette's frauds. The question now arose as to the appointment of a parliamentary committee for the investigation of this and other charges and rumors. M. Briand declared that such a committee of inquiry was, in his opinion, an encroachment on the judicial authority, but if the government received in advance a vote of confidence as to its declaration, he did not object to such a committee. The government received a vote of confidence and the Chamber went on to appoint a committee of 33 for this investigation. M. Clemenceau, who appeared before the committee in October, denied that he had given any instructions to the Prefect of Police, M. Lepine, to find a prosecutor of M. Rochette, but had told M. Lepine to see the judicial authorities and take instructions from them. M. Lepine appeared before the committee in the Rochette affair on November 22, and admitted that he had sought for a private prosecutor to bring charges against M. Rochette. He also declared that, according to his recollections, M. Clemenceau had told him to take this course, and further said that it was customary for the Prefect of Police, and in fact an every day matter, to seek out a private prosecutor in such circumstances.

**THE GREAT RAILWAY STRIKE.** On October 11, one of the most threatening strikes of recent years was declared on the Northern Railway. It tried the power of the government to the utmost and led to a definite stand on the important question of the relations of the state to labor, particularly as regards the right of civil servants to go on strike. The government's summary solution of the question made it one of the most significant strikes of recent years. In April, 1910, the demands of the men were set forth in a congress of railway employes in Paris. On the Northern and Southern systems the men demanded an increase of wages to a minimum of 5 francs. There were, however, many other grievances, varying with the particular circumstances in the privately owned companies. The congress decided to ask the government to appoint a conference between the directors of the companies and the men, and threatened that if the companies did not accede to the demands of the men they would attempt a general strike. This threat having failed to accomplish any definite result, the General Confederation of Labor organized a general strike which took place at the end of May on the Southern railways. These lines were thrown into complete confusion, some 10,000 men having gone on strike. A provisional agreement was made between the companies and the men early in June and work was resumed. Thereupon the General

Confederation of Labor endeavored to arrange a strike on the Northern lines. The movement for a general strike was becoming formidable early in July, for although there seemed to be a desire for mutual understanding on the part of individual companies and men, the National Union of Railway Men adhered to an uncompromising attitude. Moreover the railway companies refused a conference with the union in the presence of the Prime Minister and the Minister of Public Works, alleging that, while they were ready to consider the complaints of their own workmen, they must do so individually and could not take part in a general conference. Thereupon the Railway Men's Union passed a resolution authorizing the strike committee to name a day as soon as possible for a general strike as a retort to this disdainful refusal of their request for a conference. Between that time and October the more aggressive element repeatedly demanded a strike, but the committee took no action. The way was opened for a general strike by the men in the station of the Northern Railway at Saint Denis early in October, and finally on October 11 a general strike throughout the entire Northern Railway was declared. The military was promptly called out and two companies of infantry occupied the Gare du Nord. Before the end of the day, traffic on the entire line was at a standstill. A Cabinet meeting was held on the same day and the strike was characterized by M. Briand as political and revolutionary rather than economic in character. He declared that despite its suddenness the government had taken energetic measures for the guarding of the line and would readily put down any attempts at sabotage. There was great danger of interrupting the food supply to the capital and the government took precautions to avert it. They also called out the troops at various points along the railway. The Nord Company made a statement immediately after the strike had broken out saying that they had been paying the required minimum wage in the Paris region since July, that other demands of the workmen concerned their railway no more than any of the other companies, and that, as to the further increase of salary, the Nord Company had already paid out during 1909 and 1910 a considerable sum beyond the usual increase. Acts of violence took place at several points and some damage was done to railway property. Those men who remained on duty were attacked by the strikers in an endeavor to terrorize them. The men's grievances were set forth at the same time. They asserted a legal right to cease work in the first place, and said that they had done so because they were weary of waiting for the fulfillment of promises. They accused the government of subordinating their interests to those of the financiers who controlled the lines and complained of exclusion from the benefits of the law that enforced one day of rest in the week. They also contrasted the large amount paid to the shareholders of the Western Railway with its refusal to give the workers their minimum wage. On October 12, the strike committee of the National Confederation of Railway Servants called a general strike on all the railways. Immediately afterwards work came to a standstill on the Northern and Western state lines.

**THE GOVERNMENT'S ACTION.** The Ministry

took an unprecedented but effective measure to end the strike. On October 12 it issued mobilization orders to some 30,000 employees of the Nord line commanding them on the following day to join the colors for three weeks' military training. They were liable to this military duty as French subjects and were thus confronted immediately with the choice between allegiance to their own government as Frenchmen, and obedience to their strike leaders as members of the union. The military duty to which they were summoned consisted in the maintenance of the line in normal working order and in obeying the orders of their official superiors. Disobedience would entail punishment as military defaulters. The government at the same time published a general decree changing the classification of the reservists of the railway regiment. This provided that the class hitherto called unattached reservists, who, upon receiving the order to mobilize, would merely have had to hold themselves at the disposal of the War Minister, should be attached to the field companies. Thus the government seized a strong weapon for forcing the return of the strikers. Soon afterwards several portions of the line were said to be in running order. For some time, however, Parisian consumers suffered from a shortage of the food supply. M. Briand explained the course of the government to members of the press immediately after the issuance of the mobilization orders. He said that he had had to deal not with a strike in the ordinary sense of the word but with a criminal outbreak and practically with an act of rebellion. He regarded it as a breach of faith that the men should quit work when he had received their representatives in the name of the government and had asked them only a few days before to present their claims, saying he would examine them. Moreover, the claims as to the minimum wage had, in a majority of cases, been satisfied, and at that very moment another of the men's demands, namely, for changes in the hours of labor, was under the joint consideration of the union leaders and the Ministry of Public Works. In spite of these negotiations a strike had been declared without warning and was marked by acts of criminal violence. The government showed a firm front and a determination to carry out its mobilization order with the utmost strictness. There was much public sympathy with the strikers at first, but later a feeling of resentment spread as the course of the strikers became known and as the bad results came home to the people. The mobilization order was received by the men of the Nord and also of all other lines except the Midi on October 13. Meanwhile the employees of the Paris-Lyons-Mediterranean and Orléans companies decided to go on strike. Five of the chief leaders of the railway strike were arrested on October 13 and many others were threatened with arrest. As to the food supply, M. Briand publicly announced on October 13 that Paris would be adequately provisioned. It was soon evident that the strike would not become general. By the afternoon of October 13 many passenger trains were running from the Northern Station and the main service of the Western State Railway had been resumed. The Unified Socialists violently criticised the course of the government and demanded that the Chamber be immediately convoked.

The Strike Committee of the Railway Men declared on October 18 that the strike was at an end. As to public opinion, it seemed to strengthen toward the view of the government, that is, that the railway strike was an act of criminal violence. The Socialists, however, continued to condemn its course.

**PARLIAMENTARY DISCUSSION OF THE STRIKE.** Hardly had the Chamber assembled when the Opposition began to interpellate the government on the strike. In the debate which followed, beginning on October 25, the Socialists displayed much passion and expressed themselves in very violent language. On that day the Chamber was temporarily suspended on account of the disorderly demonstrations. M. Briand forcibly defended the course of the government, persisting in his speech in spite of repeated efforts to drown him out on the part of the Socialists. He repeated what he had already said, namely, that the government was not dealing with a strike, but with an anarchistic outbreak, and that he had evidence of an organized plan for sabotage, and that there was no other course for the government to take, confronted as it was by civil war.

In the session of October 29, M. Briand caused a storm in the Chamber by boldly announcing to the Socialists that "if the government had not found in the law that which enabled it to remain master of the frontiers of France, and master of its railways, which are indispensable instruments of the national defense, if, in a word, the government had found it necessary to resort to illegality it would have done so." There was immediately an outbreak of fury among the Socialists and cries of "Dictator, resign!" The tumult lasted for an hour. Meanwhile, M. Briand continued to speak to those about him and an official report of his address was taken. He went on to say that he had acted on the true doctrine of the French Revolution and that the members of the Extreme Left ought to acknowledge and respect it. This was the doctrine *Salus publica suprema lex*. On the following day he again addressed the Chamber, pleading with the members of the Extreme Left to listen to reason. What he had said in the heat of debate did not indicate any intention on the part of the government to violate the law or resort to a dictator. It meant simply that in so serious a crisis the government was obliged to adopt severe measures. He concluded with the words, "I ask your judgment; I take entire responsibility. If you say that you have not confidence in the government, why then the 'Dictator' will at once bow to your decision." Thereupon a vote of confidence was taken, which showed a complete defeat of the Anarchist Left and the Socialists, the government receiving 329 votes against 183.

A meeting of the Cabinet was held on November 2, at which M. Briand declared that he had been publicly accused of designs against the liberties of the nation. His Ministry having been called into question in this manner he believed that the proper course was to allow the President of the Republic to consider whether he should be upheld or not. He believed that the whole Cabinet ought to tender its resignation. Thereupon the Ministers all signed their resignations. Later M. Briand was summoned by the President and entrusted with the formation of a new Ministry. The follow-

ing members of the former Cabinet were retained: M. Pichon, Minister of Foreign Affairs; General Brun, Minister of War, and Vice-Admiral Boué de Lapeyrère, Minister of Marine. In general the other members had not previously held Cabinet positions. The programme of the new Ministry comprised electoral, administrative, judicial and social reforms, the last named including certain changes in the legal status of trade and labor unions and the establishment of a form of optional profit sharing. The main aim of the government, however, was the settlement of the issue raised by the strike. The Ministry was in full harmony with M. Briand on the principle that public servants must be required to discharge their duties regularly and without interruption. In the debate which followed the ministerial declaration of policy, the Socialist leader, M. Jaurès, made a sharp attack upon the government's course and vindicated his own position. A vote of confidence showed a reduced government majority of 87.

On November 15 M. Briand explained in a Cabinet Council the proposed legislation concerning the status of workmen in the government employ. It comprised measures for instituting a permanent conciliation board, comprising representatives of the railway companies and employees, and for a council of arbitration; prohibiting any strike if arbitration is not accepted or while the negotiations are in progress; amending the army law of 1905 so as to give the government authority to requisition railway servants if need arises; giving the government authority also as regards other public services affecting the national safety or health; finally, measures providing for strict repression of sabotage and for policing of railways.

**OTHER EVENTS.** A serious strike broke out among the seamen at Marseilles at the beginning of April which caused great loss to trade at the port. The attempt, however, to turn it into a general strike failed, the confederated trade and labor unions, in spite of the demands of their leaders, having refused to renew the general strike. At the end of April a serious strike took place at Dunkirk in which 25,000 men went out. Some rioting occurred and a number of arrests were made, resulting in the sentence of the strikers to heavy terms of imprisonment. To avoid danger of public disturbance on May-day in Paris large bodies of troops and police were assembled and finally the labor leaders decided to abandon the May-day demonstration, the Minister of the Interior and the Prefecture of the Police having announced the intention of the government to repress rigorously any disturbance.

Of late years France has suffered many marine disasters and her already long list of fatal accidents was increased in 1910 by the sinking of the submarine *Pluviose*, near Calais, with a loss of 27 officers and men. An impressive funeral ceremony took place in Paris on June 22 when the President of the Republic paid a tribute to the heroism of those who had attempted to save the doomed vessel.

Serious rioting took place in the Faubourg Saint Antoine quarter of Paris on June 26, resulting in the injury of over 40 policemen. Revolutionary members of the General Confederation of Labor took occasion at a funeral of one of their comrades to make a demonstration against the police, with whom they came

into collision on returning from the cemetery.

There was some opposition to raising the new Hungarian loan in France and there was a question whether such a loan could be admitted to quotation on the Bourse until the holders of certain Austro-Hungarian securities were indemnified for their depreciation. The Turkish overtures for a loan were refused, but Turkey continued to press the matter and it was reported that arrangements for such a loan had been made with a group of French bankers. A Franco-British syndicate agreed upon a loan for Greece.

The cost of living was a subject almost as widely discussed in France as in the United States. The General Confederation of Labor started in the summer an active campaign on the subject. At a meeting toward the end of August, the government was urged to abolish the corn duty for two days, and a resolution was passed threatening violent action unless something were done to improve the situation by lowering prices.

**FREMIET, EMMANUEL.** A French sculptor, died September 11, 1910. He was born in Paris in 1824. He exhibited his first work, "The Gazelle," in 1843. This was followed by a group of animal studies, of which "The Mother Cat," "A Wounded Dog," and "Group of Dogs" were bought by the state. In 1850 his "Wounded Hound" made a remarkable impression. From this time on he exhibited constantly. In 1875 he succeeded Barye as professor of drawing and molding at the Jardin des Plantes. His famous "Gorilla Carrying off the Body of a Woman," refused at the Salon in 1859, received the medal of honor in 1887. He received the grand prize at the exhibition of 1900. He was considered by many to be superior to Barye in his animal studies, and his knowledge of anatomy and the power and realism of all his works were notable. Among his best-known sculptures, in addition to those mentioned above, the "Faun," in the Luxemburg, "Jeanne d'Arc," in the Place des Pyramides, and an improved version of the same subject which is now in Fairmount Park, Philadelphia, "Velasquez on Horseback" and the statue of de Lesseps at Suez. His extensive exhibit at the St. Louis Exhibition in 1904 attracted much attention.

**FRENCH, SAMUEL GIBBS.** An American soldier, died April 20, 1910. He was born in Gloucester county, N. Y., in 1818, and graduated from the United States Military Academy in

1843. He served until 1856 in the United States Army, when he resigned after having reached the grade of captain. He saw service in the Mexican War and took part in several important battles. Previous to the outbreak of the Civil War he was colonel and chief of ordnance of the army of the State of Mississippi. He was commissioned brigadier-general of the Confederate Army in 1861, and was made major-general in 1862. He served in the Army of Northern Virginia from 1861 to 1863, and in 1862 commanded the Department of North Carolina and Southern Virginia. In 1863 he was sent to join Gen. Joseph E. Johnston in Mississippi. He took part in many important engagements, including those at Kenesaw Mountain and Jackson, Mississippi. After the war he engaged in business as a cotton planter. He was the oldest Confederate general at the time of his death.

**FRENCH, WINSOB B.** An American soldier, died March 24, 1910. He was born in 1833 in Proctorville, Vt. He graduated from Tufts College in 1859. In the Civil War he was colonel of the 77th New York Volunteers and was breveted brigadier-general for bravery on the field at the battle of Cedar Creek. After the war he practiced law in Saratoga, N. Y., and in 1868 he was appointed district-attorney for that county. While he was in this office he attained wide prominence in 1879 by subpoenaing to appear before the grand jury of Saratoga county Henry Ray, a member of the Assembly, who refused to appear. On the application of General French, an attachment was issued and Ray was arrested. General French was thereupon summoned to appear before the Assembly for high breach of privilege in offending the dignity of the House by arresting one of its members. General French appeared, and after his appeal before the Assembly, a resolution was adopted discharging the action. This is known as the famous "breach of privilege" case. Since that time no State legislature has ever undertaken to interfere with the jurisdiction of the courts.

**FRENCH ACADEMY.** See **ACADEMY, FRENCH.**

**FRENCH ARCHITECTURE.** See **ARCHITECTURE.**

**FRENCH CONGO.** See **FRENCH EQUATORIAL AFRICA.**

**FRENCH EQUATORIAL AFRICA.** A French possession extending along the west coast of equatorial Africa, between the Belgian Congo and the German Kamerun protectorate; and made up of three colonies: the Gabun Colony (area, 120,745 square miles; population, 4,000,000; capital, Libreville), the Middle Congo Colony (170,255 square miles; 3,000,000 inhabitants; capital, Brazzaville), and the Ubangi-Shari-Chad Colony (Ubangi-Shari 154,400, Chad 223,800 square miles; population, 2,000,000 and 1,000,000; capital, Fort-de-Possel); known till 1910 as the French Congo. The Chad region is for some purposes administered as a territory. Total area, 669,280 square miles; total population, 10,000,000, mostly negroes. There are 53 mission schools, with about 3600 pupils. Valuable woods are contained in the forests, and rubber is collected. Gold, copper and iron are found; chalcosine is mined at Mindouli. Imports (1908), 10,028,000 francs (France, 4,207,000); exports, 16,802,000 (France, 7,420,000). Vessels entered, 82, of 118,000 tons. Loango is an important port. The projected railway from

Libreville to the Congo is expected to develop the country. Telegraph lines, 870 miles. The budget for 1907 balanced at 6,472,000 francs. French expenditure in 1910, estimated at 6,422,000 francs. Debt, 1,706,000 francs. Military force, 4177 (322 Europeans). The Middle Congo has an administrator-in-chief, the other colonies have lieutenant-governors; all are under the control of the commissioner-general (1910, M. Merlin). The name French Congo was changed by decree in 1910 to French Equatorial Africa, and various details of administration will be altered.

A convention for the delimitation of the Congo-Kamerun frontier was signed April 18, 1908.

The state of KANEM northeast of Lake Chad (capital Maô), is a district of the Shari region; WADAI (area), 170,000 square miles; population, 2,000,000; capital, Abeshr, east of Kanem, is also a French protectorate.

Lieut. Boyd Alexander, the well-known explorer, was murdered by natives in Wadai, April 2, 1910. In February, 1910, the news came of a massacre of Senegalese troops under French command, a column of 109 men and four French officers having been ambushed and almost completely destroyed. A punitive expedition was sent early in 1910 into the Dar Tama region. This was entirely successful, defeating the natives at Agredah with a loss of about 100.

Arabs attacked a body of French native auxiliaries at Daffa to the north of Lake Chad and were defeated after four hours' fighting, with a loss of 100 killed and 37 wounded, while the French loss was but 9 killed or missing and 19 wounded.

Early in November it was reported that a massacre of French soldiers and officers had taken place at Abeshr in Central Africa and that the tribesmen had pillaged the French posts and driven out the garrisons. They had captured guns and some ammunition.

**FRENCH ESTABLISHMENTS IN OCEANIA.** A French colony composed of widely scattered islands and groups of islands in the southern Pacific, having a total estimated area of 1520 square miles and a population of 30,563, mainly Polynesians. Of the Society Islands, the most important are Tahiti (area about 600 square miles; population, 11,691) and Moorea (50 square miles; 1564 inhabitants). The Marquesas Islands have an area of 480 square miles; population, 3424; largest islands, Nukahiva and Hivaœa. Other groups are the Tuamotu group (3828 inhabitants); the Leeward Islands (Isles sous le Vent), of which Huahine (1230 inhabitants), Raiatœa and Tahaa (3347), and Bora-Bora-Maupiti (1295) are the most important; the Gambier Islands (1533), of which Mangareva is the principal; the Tubuai Islands (Rurutu and Rimitara the largest); Raivavae; and Rapa. Papeete, on the island of Tahiti, is the capital and chief town. Total schools (1909), 55; teachers, 69; pupils, 2761. The table of exports shows the staple products. Total imports and exports (1909), 4,612,930 and 5,051,442 francs respectively, against 3,867,863 and 3,145,326 in 1908. Imports in 1909 consisted of animals and animal products, 605,634 francs; cereals and vegetable products, 1,361,666; minerals and metals, 260,974; manufactured articles, 2,384,656. A comparative table follows, showing the principal products and quantities exported in 1908 and 1909.

	1908		1909

Vessels entered (1909), 51, of 87,338 tons; cleared, 51, of 87,228. Revenue and expenditure (1909), 2,410,626 and 2,213,645 francs respectively; subvention, 150,000 francs. Governor (1910), Adrien Bonhoure.

**FRENCH GUIANA, or CAYENNE.** A French colony and penal settlement on the northeast coast of South America. Area, 34,061 square miles; population (1906), 39,349. Cayenne (chief town and sole seaport) has 12,426 inhabitants. Penal population (1908), 4412 transported and undergoing reclusion; 2700 recluses; 1065 freed. Primary schools, 24, with about 2230 pupils; there is a college at Cayenne. Rice, corn, manioc, cacao, coffee, sugar-cane, indigo, tobacco, and gutta-percha are produced. Under cultivation, 8800 acres. Placer gold-mining is carried on; 4098 kilograms (worth 11,065,000 francs) were declared for entry at Cayenne in 1908. In 1908, 336 vessels, of 50,262 tons, entered. Imports and exports (1908), 12,169,000 and 12,852,000 francs respectively. The local budget for 1907 balanced at 3,497,000 francs. Debt, 76,000 francs. The colony is administered by a governor (1910, M. Samary).

**FRENCH GUINEA.** A French colony in French West Africa (q. v.). Area, 254,000 square kilometres (98,000 square miles). Estimated population (1908), 1,734,024. Capital, Konakry, with 10,077 inhabitants. There were in 1908 27 official schools, with 1595 pupils; 3 private, with 92; 3843 Mussulman, with 23,754. The main products, with export values in 1908, are given as follows: rubber, 10,876,604 francs; live animals, 1,667,213; animal products, 791,229; palm kernels; 701,989; copal, 438,111; peanuts, 204,361. Total imports and exports (1908), 14,253,442 and 15,509,532 francs respectively. Vessels entered, 613, of 42,567 tons; cleared, 613, of 7739. The Konakry-to-Niger railway is open as far as Mamu, 337 kilometres; under construction, 229. Telegraph lines, 2800 kilometres; telephone, 75. Number of post and telegraph offices, 31. Revenue in 1908, 6,610,279 francs (direct taxes, 4,791,950 francs; patents and licenses, 303,053; posts and telegraphs, 129,799; etc.); expenditure, 6,100,628. The colony is administered by a lieutenant-governor (1910, V. T. Liotard), under the direction of the governor-general of French West Africa. The jetty, 1066 feet long, at Konakry, has been completed.

**FRENCH INDIA.** The French possessions in India consist of five separate dependencies, with an aggregate area of 198 square miles; population (1906), 277,723. The towns are Pondichery (the capital), Karikal, Mahé, Chander-nagar, and Yanaon. Birth rate at Pondichery (1907), 33.14, death rate, 49.22 per 1000. Schools (1907), 340, with 584 teachers and 18,914 pupils. Paddy, groundnuts, and ragi are grown. There are 4 cotton mills, with 1357 looms and 68,130 spindles, employing 6200 persons. There are also two oil factories, an ice factory, and a co-coatine factory. Imports, 1908 (raw cotton, seeds, and pulse), 8,937,000 francs; exports (cotton goods, groundnuts, and oil cakes), 27,048,000. Vessels entered (1907), 385, of 751,000 tons. Railways (1908), 30 miles. The budget (1907) balanced at 2,397,000 francs; debt, 796,000. The colony is administered by a governor (1910, F. E. Leveque).

**FRENCH INDO-CHINA.** A French dependency in southeastern Asia composed of five states: Annam, Cambodia, Cochín-China, Tongking, and Laos (qq. v.). Collective area, about 309,979 square miles; population, 16,315,063, mainly Annamites. Capital, Hanoi, in Tongking (103,238 inhabitants). Rice, corn, pepper, silk, cotton, tea, sugar, rubber, and tobacco are grown. The mines yield coal and lignite, zinc, antimony, tin, wolfram, and gold. Output, 1908: 329,000 tons coal (3,306,000 francs), 18,000 tons lignite (152,000 francs), 12,000 tons zinc ore (1,205,000 francs), 164 tons tungsten and tin (307,000 francs), 170 tons gold ore (340,000 francs). About one-fifth of the foreign trade is transit, passing to and from the Yunnan treaty "port" of Meng-tsze through Tongking. Total imports and exports (1909), 251,997,750 and 265,457,000 francs respectively. Export of rice in 1908, 1,214,512 metric tons. Vessels entered (1908), 2139, of 2,020,004 tons (1134 junks, of 25,598 tons). Total length of railways, 811 miles. In May, 1909, the railway to Yunnan-fu was opened as far as Meng-tsze, and was to be completed in 1910. The Chinese granted (1908) the right of an extension to Singan. Telegraph lines, 8563 miles; offices, 328. Telephone lines, 270 miles. Post-offices, 264. There are separate budgets for the several states, and a common budget for Indo-China. The general revenue (mainly from customs, excise, etc.) amounted in 1909 to about 47,500,000 dollars Mexican. Expenditure of France (1910 budget), 13,282,490 francs for Cochín-China, 24,765,655 for Annam and Tongking, chiefly for military purposes. Troops (1909), 12,042 European, 14,492 native. Naval force, 1 armored battleship, 3 armored cruisers, 3 protected cruisers, 4 destroyers, 1 armored gunboat, 12 torpedo boats, 4 submarines, and a number of small vessels, with about 4500 men. A governor-general (1910, A. Klobukowski) administers the country. A superior council, consisting of the administrative heads of the subordinate colonies, with the military and naval commanders-in-chief and representatives of commerce, agriculture, etc., controls financial affairs, both general and local. The colony is one of the most prosperous of the French possessions. It is represented at Paris by one senator and one deputy.

KWANG-CHOW-WAN (q. v.) is under the authority of the governor-general of French Indo-China.

**FRENCH LITERATURE.** Ever since 1907 we have noticed a great readiness on the part of

the French writers to rest after years of turmoil in their country. Even when the separation of Church and State became an accomplished fact the event was not reflected in literature as it undoubtedly would have been if every one had not felt the need of a period of recovery. The year 1909 was called here one "of general goodwill"—so was 1910; with this difference, that while in 1909 one felt still reminiscences of earlier discussions, they were felt by the efforts made to forget them; in 1910 there is not even that to remind one of days of misunderstanding. Such men as Capus or Tristan Bernard with their optimistic fatalism, or Zamacois with his efforts to see life from a poetical point of view, reflect best the present state of mind, while even the amiable skepticism of Anatole France is too biting at times.

**THE THEATRE.** As in previous years we supplement here only what is said elsewhere about the drama of the year. Most successful plays in France were of the lighter kind. A. Capus's *L'ange* and *L'aventurier* show, the one with a woman as a hero, the other with a man, that life after all may be depended upon to come out all right. The "Angel" (ironical title) loves twice very different characters, and then falls to the lot of a third one who has just the right temperament to stand her nature. The "Adventurer" is a self-made man who conquers the prejudices of his dignified family. The same amused optimism is found in Tristan Bernard's *Danseur inconnu*, and in his more sarcastic *Peintre exigeant*. Courteline's funny *Boubouroche* is worthy of the author's fame. Zamacois' *Fleur merveilleuse* is a poetic and delicate fancy like the *Jesters* and has the same theme as Daudet's *Arlesienne*, but not in the tragic vein. More aggressive is the fantastic in Rostand's *Chantecler*, which was attacked so savagely by the press in France that one cannot but suspect personal feelings of jealousy inspiring some of the critics. Of the dramas few deserve mention. Bataille's sensationally psychological *Vierge folle* was disappointing to the author's admirers; Americans have seen in translation the story of this neurasthenic girl ending by suicide. Pierre Wolf's *Les Marionnettes* (marionettes of love) strikes the same note. Bourget has the only thesis drama worth discussing; his *Barricade* defends conservative views regarding the social problem, social hierarchy is justified, and the only principle of social order.

Two posthumous plays of great import were put on the stage: *L'école des Ménages*, by Balzac—a household, threatened in its existence by a fancy of the hero for his first shop-girl, gives Balzac an opportunity to assert his views regarding the sanctity of marital ties. *Polichinelles* by Becques, is realistic drama underlining as usual all that is bad in man. Among the novels that went on the stage are Balzac's *César Birotteau* (staged by Fabre) and Prevost's *Pierre et Thérèse* (see YEAR BOOK (1909)). There was an interesting Shakespeare revival in France. The "Théâtre français" gave *Hamlet*, the "Odéon," *Jules César*, and the theatre "Femina" gave very successful fortnightly Shakespeare evenings (*Tempest*, *Midsummer Night Dream*, *As You Like It*, *Troilus and Cressida*, etc.). At Orange this summer the actors of the "Français" gave *Alkestis*, by Rivolet (the third year) *Le Cid* and *Hamlet*. A rather amusing performance was that of a young playwright, René Fanchois (author of *Beethoven*—see YEAR BOOK,

1909), who in a public lecture at the "Odéon" furiously attacked Racine. The students stood by Racine.

Le Bargy has resigned from the Comédie française (or had to). The *Mémoires of Got* have aroused great interest; also a *Vie sentimentale de Rachel*, which was published by Mlle. V. Thomson.

POETRY. The unusual quantity of poetry published in 1910 confirms what we said at the beginning of this article, that people in France wanted to turn their thoughts away from the battles of real life. Many of the best-known poets of France have published verses: Fernand Gregh, *La chaîne éternelle*, a sort of "Légende des siècles" of human progress as seen by a man of the Twentieth Century; St. Merrill, *Une voix dans la foule*; Em. Bergerat, *Ballades et Sonnets*; L. Tailhade, *Poèmes élégiaques*; Z. Bois, *L'humanité divine*, (divine, because suffering ennobles it). Other names not so well known, but deserving to be mentioned are: L. Bocquet, *Les branches lourdes* (which are the heavy thoughts that weigh on the soul, but they are conquered by love); A. Delacour, *Le rayonnement*—higher joys of life; P. Bonetti, *Les orgueils* (pride when one does something to uplift humanity). G. Sorbet in *Le Soleil de rêve* dreams of nations freed of war; Vercingetorix, Charlemagne, Saint Louis, Joan of Arc, etc., appear before the poet and express their surprise that men have not yet become reasonable and have not abolished war. E. Gojon in *Visage penché* evokes Paris, the great city representing civilization triumphing over the timid and the reactionaries. H. Bouvelet in *Royaume de la terre* expresses in noble lines the philosophic aspirations of the enlightened world. Jules Romains in *Un être en marche* applies Le Bon's theory of the psychology of the masses to a boarding school for girls. Mere names will have to be given for lack of space in the following cases: M. Pottecher, *Paroles d'un père*, Trarieux, *Le portique* (sonnets); E. Jaubert, *Cent ballades*; J. Cocteau, *Le prince frivole*; Toussaint, *Sculpteur de sable*; Maurice Rostand *Poèmes* (style of his famous father). A special mention for Paul Olivier's collection of *Chansons de métiers* (professional songs) with music, and D. Cortier's *Roman de Renard* in modern verses. A great many prizes were awarded: The "Prix National de poésie," given by the government, went to M. Levaillant's *Le Temple intérieur* (remembrances of childhood, philosophy and great hopes of youth). The French Academy has divided several of its prizes, and there was indeed a great variety of talents: Gaubert, *Roses latines* (Provençal songs); W. Chapman, *Rayons du Nord* (Canada); Chenevière, *Les Beaux jours* (days of love); Géraudy, *Petites âmes* (children); Viadot, *L'eau du puits* (religious songs); Arnoux, *Au grand vent* (some exquisite poems inspired by Racine); H. Allorge, *Clavier des harmonies* and *Ames géométriques* (poetical effects obtained by scientific inspiration); Gautier-Ferrières, *Les Romances à Madame* (romantic); Mme. Darget, *Les matinales* (both lyric and dramatic). The "Prix Sully-Prudhomme" went to a young Norman poet, René Bardet, for his book *La Vieille Maison*.

THE NOVEL. The place of honor belongs to a posthumous novel by H. Taine, *Etienne Mayran* (fragments), the masterly picture of a school-boy, both emotional and keen, awakening to the intellectual life of forty years ago. Many recent

novels are still bearing the mark of the realism of the same period. Social problems are studied by Rosny (aîné), *La vague rouge* (trade unionism), by Ch. Géniaux, *Forces de la vie*; and by Le Goffic, *Ventose*. Paul Adam, still dazzled by his experiences in America, writes *Le Trust* and *Le rail du sauveur*. Among the psychological novels, there is one (posthumous) by E. Rod, *Le glaive et le bandeau*, which is specially good. It is a powerful dramatic description of a three days' trial which uncovers all sorts of unsuspected human weaknesses and miseries. P. Margueritte's *La faiblesse humaine* is the story of a provincial lawyer who has himself elected as a deputy in order to live in Paris; there he yields to the usual temptations and renders everyone miserable; but he is rescued by the love and forgiveness of an excellent wife; Amiot's *L'approche du soir* is the story of the love of a man of 47 for a girl of 26. Pierre Valdagne's *Les bons ménages* is a cynical book insinuating that everything is lie and hypocrisy in this world. Not only cynical but brutal is Duvernois' *La bonne infortune*. Cl. Farrère has described with his usual talent *Les petites aliliées*, meaning what may be called here the "grisettes" of a seaport in Southern France. One of the strong books of the year, in spite of its unpleasant subject, is unquestionably the semi-pathologic *Lucien* by Binet-Valmer; Lucien a sort of foul creature, son of a splendid father (a physician) who suggests to his own son suicide to avoid the shame of impending public exposure; but Lucien is too much of a wreck to die honorably. (The name of Balzac was mentioned repeatedly in connection with this book). A pathological case we have also in Postel du Mas' *Roman d'un révolté*; on purpose the hero commits one after the other all the crimes punished by laws, then commits suicide. Vigorous is H. Hirsch's *Le crime de Potru soldat*; Potru has killed in an hour of anger his sergeant, and has remained undiscovered; but a fellow soldier knows all, and in the meanest fashion takes advantage of it to persecute his victim, who is driven to suicide. Tony d'Ulmes has a medical novel, *Les Demi-Morts*, meaning the patients of tuberculosis agonizing slowly in the glorious scenery of the Riviera. In contrast to such gloomy themes is the novel by A. Capus, *Robinson*, a man who finds nowhere in society exactly the place he wants, and finally goes out to the country to cultivate a farm (always the smiling philosophy of *Qui perd gagne*); and that of Courteline, *Coco, Coco et Tolo*, one of the funniest stories by this author. The old-fashioned moralizing novel is represented by H. Bordeaux's *Robe de laine*, a man who cannot understand the simple and devoted love of a charming wife who dies of sorrow, leaving her husband, who has understood too late, a prey to endless remorse. Fancy novels are Boulenger's *Pavé du roi*, a Parisian dandy, bankrupt, driven by necessity to become a coachman on the highroads of France, and Donat's *Le Mort Vivant*, a sort of duplicate of Villiers' *Eve future*: a physician has made an automaton so perfect that when the master dies his servant can substitute the automaton for him. Romain Rolland has added a new volume to his *Jean Christophe* (see YEAR BOOK of 1907), namely, *Les amies* (select types of women he met in Paris). Three novels of provincial life are especially noteworthy: Rod's *Le pasteur pauvre* (a clergyman of French Switzerland); L. Dumur's *Le centenaire de J. J.*

Rousseau in Geneva (very amusing); and H. Bachelin's *Robe noire*; a seminarist comes back to his native village in his black gown and filled with spiritual pride, but he comes near having a love adventure; he conquers, and the girl after his departure decides to wear the white robe of the Virgin. Bazin's *La barrière* describes the terrible social "barrières" erected in England by confessional distinctions. Exotic novels are still in favor: L. Bertrand, *Les bains de Phalère* (sentimental story under the sunny skies of Greece); Mirriam Harry, *Madame Petit Jardin* (a love adventure in Tunis described in a sort of Pierre Loti style); E. Nolly, *La barque Annamite*, describing old customs driven out by European civilization. Three lively novels describe the stage life, Aug. Germain, *Les maguillées*, André Castigne, *Les jolies bill-topers*; Colette Willy, *La Vagazonde*. *Le roi des airs* by G. de Weede is an aviation novel. Stories with children for heroes become more numerous every year. A. Lichtenberger leads again with *Le petit roi* (king child almost crushed by etiquette); F. Nohain attracted attention with his *Jaboune*, a modern child, childish, but no longer the naive child of tradition; M. Epy's *Petit âme* tells that all the best things in life we owe to the presence of children; Fr. Jammes tells most charmingly the story of *Ma fille Bernadotte*. Here would belong L. Delzons' *Le meilleur amour*; the love for children is the best, because disinterested, love, while the other love is the most egoistic feeling in men. Ch. de Pomairols has an original novel, *Ascension*, describing the soul of a girl possessed with a religious vocation and who enters a convent.

The chief novels of the year by women are: Daniel Lesueur, *Princesse Flaviane*, which adds another to her monotonous list of books inducing women to resist by force man's egoism; Renée Lafont, *L'appel de la mer*, the deceptions of love for a woman; and Mme. Marbo tells us that *L'heure du diable* is the hour of man. Mme. Delarue Madrus, with characteristic feminine exaggeration thinks in *Comme tout le monde* that all marriages that look happy cover awful tragedies and hatred. On the other hand, Mme. Colette Yver in *Les Dames du palais* continues her series of novels in which she discourages women from entering the liberal professions; here she takes up women lawyers. Mention has been already made of Mirriam Harry's exotic novel. Jean Bertheroy in *Gilles le Ménestrier* takes us into Sixteenth Century life. Worthy of mention are Duchesse de Rohan, *Les dévoilées du Caucase*; Gyp, *Les petits joyeux*; and Brada, *La brèche*, and attention should be called to the new name of Marie Audoux, a former dressmaker, whose semi-autobiographical *Marie-Claire* has attracted much notice. She received the 5000 francs prize of "La Vie Heureuse."

**SHORT STORIES.** A rich crop of excellent collections, many of the realistic type: Cl. Farrère, *Trois hommes et deux femmes*; L. Frapié, *Contes imprévus*. More psychological are: Bourget, *La dame qui a perdu son peintre*; Ch. L. Philippe, *Dans une petite ville* (the author died in the year); E. Jaloux, *Le Boudoir de Proserpine* (very successful), light, Eighteenth Century style applied to rare love stories. A sort of revival of the fantastic and weird story was noticeable: Pierre Mille was much praised for his volume, *La biche écrasée*, reminding one now of Poe, now of Maupassant; Ch. Foley, who in his

*Chambre au Judas* sings the whole scale of human terrors; G. Apollinaire offers the same sort of catching and disconcerting stories with a more frivolous purpose in *L'hérésiargue et Cie*. An amusing volume of military stories is *Binettes militaires* by A. Charmain, and A. Lichtenberger has stories of the French Revolution, *Tous héros*.

Finally mention should be made of a clever book, *A la manière de* by Paul Reboux and Ch. Muller, imitating the story of famous recent novels and story writers.

The "Prix Goncourt" for 1910 was awarded to Louis Pergaud for a book called *De Goupil à Margot* (16th century novel).

**MÉMOIRES AND HISTORY.** Comparatively few works of importance were published in this line, usually so well represented. For the Seventeenth Century E. Magne's *Mad. de Châtillon*, and for the Eighteenth. Funck-Brentano's *Rosette* (Rose de Launay) are the only ones to mention. For the time of the Revolution: Aulard, *Etudes sur la Révolution*; G. Fabre, *Les pères de la Révolution*; Marquis de Ségur, *Au coucher de la Monarchie*; D. Almeras, *Charlotte Corday*; De Billard, *Les femmes enceintes devant le tribunal révolutionnaire*; Stenger, *Le retour de l'empereur*; P. Frémeaux's remarkable *Les derniers jours de l'empereur*, and the diary of Hudson Lowe; two works on *Talleyrand* by Lacombe and by Loliée. The third volume of the *Mémoires de la Duchesse de Dino* came out. J. Claretie gives interesting souvenirs of the Franco-Prussian War in *Quarante ans après*.

**LITERARY CRITICISM.** No contributions were made which call for much comment. Here are some valuable books arranged according to periods: Mme. L. Félix Faure Goyan, *Vie et mort des fées*; Armaingand, *Le Contre un* (see YEAB BOOK, 1908); Rocheblave, *Agrippa d'Aubigné* (coll. des grands écrivains); Lemaitre, *Fénelon*; Masoon-Forestier, *Racine ignoré*; Caponnière, *Piron*; Gaiffe, *Drame du 18me siècle*. Rousseau is still the favorite author: Champion, *J. J. Rousseau et la Révolution*; Dide, *J. J. R. le protestantisme et la Révolution*; Rodet, *J. J. R. et le contrat social*; Vallette, *J. J. R. Genevois*. In the Nineteenth Century: Souriau, *Idées morales de Mad. de Staël*; Léon Séché, *Delphine Gay, Jeunesse dorée sous Louis Philippe*; P. Lafond, *L'aube romantique, Res-séguier*; A. Séché et Bertaut, *Au temps du romantisme*; Cim, *Le chansonnier Debraux*; Troubat, *La salle à manger de Ste-Beuve*; Clouard, *Balzac*; Dupuy, *Alfred de Vigny, ses amitiés*; Dumoulin, *Les Ancêtres d'A. de Musset*. The letters of Musset to his sister-in-law-to-be were published. After the period of Romanticism: Parigot, *Renan*; Seillière, *Barbey d'Aure-villy*; Ch. Brun, *Le roman social en France*; St. Zweig has a most interesting book on *Verhaeren*. A book on women poets by Jean de Gourmont, *Muses d'aujourd'hui*. J. Bertaut published a well-received *La jeune fille dans la littérature française* (he takes authors like Molière, Fénelon, Rousseau, Hugo, etc.). Finally the much-discussed article of Faguet (*Revue des Deux Mondes*, September 15) on the crisis of the French language must be remembered: The crisis exists, but it is unavoidable; modern preoccupations render it impossible to work on style as formerly; still, one can prevent things from going too fast, by studying Latin which gives the real meaning of words, and by reading

slowly so as to appreciate the value of shades of expression.

**VARIOUS EVENTS.** The following "Immortals" died: A. Vandal, P. Lamy, and Melchior de Vogüé. Three members were received in the Academy: Brieux, Prévost and Doumic.

The Académie Goncourt lost Jules Renard, and replaced him by Mme. Judith Gautier. Besides those mentioned the roll of the dead counts such important names as Edouard Rod, Jean Moréas, and Louis Bousсенard (author of *Le Tour du monde d'un gamin de Paris*). Among the centenarians celebrated are: Musset and Maurice Guérin (the author of *La bacchante* and *Le Centaure*). The twenty-fifth anniversary of Hugo's death was commemorated, and also the eightieth anniversary of Mistral. Monuments were erected to Musset, Rousseau, A. Chénier, Coppée, Vicaire, Allais, Mme. Cottin, Mme. de Ségur, etc. Let us not forget the festivities in September of the thousandth anniversary of the foundation of the Abbaye de Cluny: to the diligent monks who kept alive in the dark ages the tradition of letters and arts, the world is greatly indebted.

**FRENCH MUSIC.** See MUSIC.

**FRENCH SOMALI COAST.** A French protectorate on the Gulf of Aden. Various estimates are given for the area, some as low as six thousand, others as high as forty-six thousand square miles. As the boundaries have not been delimited, the *Almanach de Gotha* estimate of about 8000 square miles seems the best at present. Population, 208,061, of the Danakil and the Somali races. Capital, Jibuti, with about 11,000 inhabitants (600 Europeans). There are mission schools. The industries are insignificant, with the exception of the coast fisheries. Imports and exports (chiefly in transit to and from Abyssinia) in 1908, 13,336,000 and 19,964,000 francs respectively. Railways, 193 miles. Steam vessels entered (1908), 233, of 418,255 tons; cleared, 218, of 376,392. Post-offices, 4. The local budget for 1909 balanced at 1,372,476 francs; French expenditure (budget of 1910), 561,500. A governor (1910, M. Pascal) administers the country.

**FRENCH WEST AFRICA.** A French dependency made up of the colonies of Senegal, French Guinea, the Ivory Coast, Dahomey, Upper Senegal-Niger; and the territory of Mauritania and the Military Territory of the Niger (qq. v.). Total area, 2,677,000 square kilometres (1,033,600 square miles). Estimated total population (1908), 10,668,253 (French, 7401; other Europeans, 1600; natives, 10,659,252). These figures, and those for the separate colonies, must be regarded as approximate only; in many cases the returns are for the fiscal population alone. There are 168 government schools, with 8189 pupils; 29 private, with 2323; 6476 Mussulman, 50,536. Government expenditures for education, 113,335 francs; from local budgets, 1,064,105. Total imports (1908), 108,590,468 francs (France, 58,013,919; French colonies, 3,268,567; other countries, 47,307,982); exports, 84,500,946 (France, 45,132,541; French colonies, 247,057; other countries, 39,121,348). Chief articles of export and value in 1908: peanuts, 33,110,005 francs; rubber, 18,736,733; palm kernels, 7,670,541; palm oil, 7,685,132; cabinet woods, 2,794,124; live animals, 2,058,065; animal products, 1,968,166; corn, 1,198,862; gum arabic, 1,593,946; copal, 439,979. Vessels entered at all ports (1908), 2024, of 2,816,004 tons; cleared, 2012,

of 2,789,057 tons. Total length of railway lines in operation in 1908, 1561 kilometres; receipts for the year, 8,956,203 francs; expenditure, 6,643,284. Total length of telegraph lines, 17,429 kilometres; telephone, 407. Total number of post and telegraph offices, 204. General budget for 1908: revenue, 27,297,979 francs; expenditure, 27,239,187. Total general and local budgets: revenue, 58,311,812; expenditure, 56,262,691. Sources of general revenue: Customs, taxes, etc., 14,979,949; interest on funds, 781,626; Senegal Protectorate, 405,000; etc.; extraordinary, 10,924,177. Items of expenditure: payments in debts, 6,632,306 francs; subventions to colonies, 4,380,000; public works, 1,759,641; customs, 1,218,524; administration, 549,519; etc.; extraordinary, 10,224,583. Total public debt, December 31, 1908, 145,879,500 francs. Expenditure of France on French West Africa (mostly military) in 1910, 15,007,237 francs. The Bank of West Africa has capital, 5,895,000 francs; reserve fund, 254,000. The governor-general (1910, W. Merlaud-Ponty) resides at Dakar, a fortified naval station in Senegal.

**FRIAR LANDS.** See PHILIPPINES.

**FRIEDHEIM, ARTHUR.** See MUSIC.

**FRIEDLANDER, LUDWIG.** A German philologist and archaeologist, died January, 1910. He was born at Königsberg in 1824 and was educated at the gymnasium of his native town, and in the universities of Leipzig and Berlin. In 1847 he became privat-docent at Königsberg. He was made full professor in 1858. His studies were chiefly concerned with Roman archaeology and the history of Homeric criticism. He edited Juvenal and Martial and published among others the following works: *Die homerische Kritik von Wolf bis Grote* (1853); *Analecta Homerica* (1859); *Ueber den Kunstsinn der Römer in der Kaiserzeit* (1853); *Darstellungen aus der Sittengeschichte Roms*, etc. (8th ed., 1888-90), and an edition of the *Cena Trimalchionis* of Petronius (1895).

**FRIENDS, THE; or THE SOCIETY OF FRIENDS,** often called QUAKERS. A denomination of Christians which had its origin with the preaching of George Fox about 1647. In the United States there are four bodies of the denomination, the so-called Orthodox, the Religious Society of Friends, to whom the name Hicksite is sometimes given by those outside of the denomination, the Wilburite and the Primitive. The difference between these bodies is chiefly in matters of church administration. In point of numbers, the largest body is the Orthodox, which in 1910 numbered about 100,000 communicants, with 1350 ministers and 570 monthly meetings. This branch is strongest in the States of the Middle West. In the United States it has fourteen yearly meetings and in Canada one. Thirteen of these are combined in a federation known as the Five Years Meeting. This body next meets in Indianapolis in 1912. The Orthodox branch has twelve colleges under its control, the best known of which are Haverford College for men, Earlham College for men, and Bryn Mawr College for women. The Orthodox body maintains missions and many philanthropic institutions. Its official organ is *The American Friend*, published in Philadelphia.

THE RELIGIOUS SOCIETY OF FRIENDS has in round numbers 20,000 members, with 183 meetings for worship. It has seven yearly meetings in the United States and Canada. The Society has under its auspices Swarthmore College at

Swarthmore, Pa., with thirteen preparatory and twelve secondary schools in New York, New Jersey, Pennsylvania, Delaware and Maryland. Its schools and colleges are all co-educational. In July, 1910, the Biennial General Conference was held at Ocean Grove, New Jersey, with the largest attendance of any similar gathering in the history of the Society. The Religious Society of Friends carries on active philanthropic work, especially in the line of peace and temperance. The Advancement Committee, appointed by the General Conference, maintains headquarters at 140 N. Fifteenth Street, Philadelphia, and has a general secretary who devotes all his time to the work of the Society. During 1910 this committee published an important volume entitled *The Life and Labors of Elias Hicks*. The Society publishes the *Friends' Intelligencer*, in Philadelphia. During 1910 the Society witnessed an upward tendency in membership and interest. For the first time in half a century the largest yearly meeting, that of Philadelphia, showed an increase in membership for 1909-10.

THE WILBURITE branch had in 1909-10 about 4500 communicants with 38 ministers. It has seven yearly meetings, each of which is independent, relations between them being maintained by an annual exchange of epistles.

THE PRIMITIVE BODY is very small, numbering about 235 communicants and 11 churches.

FRUITS. See HORTICULTURE.

FULLER, MELVILLE WESTON. Chief Justice of the Supreme Court, died July 4, 1910. He was born in Augusta, Me., in 1833, and graduated from Bowdoin College in 1853. He studied law in the office of his uncle, George W. Weston, at Bangor, Me., and attended lectures in law at Harvard College. In 1856 he was admitted to the bar and began practice in Augusta, where he was elected to the City Council and also for a time served as city attorney. At the same time he edited the *Augusta Age*, which was founded as a rival to James G. Blaine's *Kennebec Journal*. The rapid growth of Chicago attracted his attention and he removed to that city. He at once took an active part in politics as a Democrat and was elected a member of the State Constitutional Convention in 1861. In the following year he was elected to the State legislature from a Republican district. Although he remained a member of the Democratic party during the war, he had no sympathy with that wing of the party which supported the South. He was a delegate to the Democratic National Convention in 1864, 1872, 1876, and 1880. During his active practice of the law, Justice Fuller was concerned in many celebrated cases and gained a reputation for an unusual scope of legal knowledge. Although he was well known in the West, his reputation had not penetrated to the Eastern section of the country and his nomination as Chief Justice of the United States Supreme Court by President Cleveland in 1888 occasioned surprise which was followed by strong opposition. The Senate hesitated for a time to confirm the appointment. Justice Fuller, however, found some warm supporters among his political opponents and his nomination was finally confirmed by a vote of 41 to 20, largely through the efforts of the Republican Senators from Illinois. In the year following his elevation to the bench he was appointed a member of the convention at Paris to arbitrate the boundary dispute between Great Britain and Venezuela

and in 1905 he was one of the peace commissioners at The Hague. Among the most important cases in which Justice Fuller gave his opinion were the nullification of the income tax law and the decision which destroyed the Northern Securities merger. Other important decisions were in the Danbury Hat case and the Western Union Telegraph Company vs. the Commonwealth of Pennsylvania. Although Justice Fuller lacked any brilliant characteristics to make him prominent in the public eye, he was noted for his thorough knowledge of the law and for his executive ability.

FURNIVALL, FREDERICK JAMES. An English philologist and Shakespearian scholar, died July 2, 1910. He was born at Egham, Surrey, in 1825 and was educated at public schools, at the University College, London, and at Trinity College, Cambridge, graduating from the latter in 1846. He studied law and was admitted to the bar in 1849. In his youth he was well known as an oarsman and in 1845 built the first two narrow sculling boats in England. For ten years he was associated in philanthropic work with F. D. Maurice, teaching in the Workingmen's College. He afterwards devoted himself to philology and succeeded in founding for the publication of texts the Early English Text Society, 1864, the Chaucer Society, 1868, the Ballad Society, 1868, the New Shakespeare Society, 1874, the Browning Society, 1881, the Wyclif Society, 1882, and the Shelley Society, 1885. He was for many years joint editor and later sole editor of the new *English Dictionary*, now called the *Oxford Dictionary*. He was also honorary secretary of the Philological Society. He edited a large number of English manuscripts and texts, chiefly through the medium of the societies mentioned above. One of the most notable of these was a *Six-Text Print of Chaucer's Canterbury Tales* (1868-1875). This he followed with the publication of the seventh text and the manuscripts of Chaucer's minor poems. Under his supervision were published forty-three facsimiles of the quartos of Shakespeare's plays. He wrote also introductions to the *Leopold and Royal Shakespeares*, and in coöperation with John Munro the introduction to the *Century Shakespeare and Shakespeare's Life and Works*. With F. W. Clarke he edited the *Old Spelling Shakespeare*. When Dr. Furnivall reached his 75th birthday the delegates of the Clarendon Press published a memorial volume written by his friends in his honor and bearing the title *An English Miscellany*. In commemoration of the same anniversary his portrait was painted and given to Trinity Hall, £450 was raised and presented to his Early English Text Society and he was presented with a three sculling boat. Dr. Furnivall was interested in a number of organizations of a philanthropic nature and was active in the Christian Socialist and the coöperative movements and in the affairs of the Workingmen's College. He held honorary degrees from many English universities and societies.

GADOLINIUM. See ATOMIC WEIGHTS.

GALLE, JOHANN GOTTFRIED. A German astronomer, died July 10, 1910. He was born at Pabsthaus, 1812. He studied the mathematical sciences at Berlin, taught for a time in a gymnasium, and was subsequently made assistant professor in the Berlin Observatory, of which Encke was director. He discovered three unexpected comets and was awarded the prize of the French Academy. His principal achievement,

**CHIEF JUSTICE MELVILLE W. FULLER**

2340

however, was the finding of the planet Neptune. Leverrier had addressed to the Berlin Observatory a request that a search be made for a hypothetical planet, whose place in the sky he had computed from the disturbances in the motion of Uranus. Galle made the search requested and was the first to perceive the new planet, September 23, 1846. He was also perhaps the first astronomer to advocate, in 1875, the use of planetoid observations for the determination of the solar parallax, a method now considered the best known. His researches on this subject were published at Breslau, where in 1851 he had been made director of the Observatory and professor of astronomy. Among his published writings are the following: *Grundzüge der schlesischen Klimatologie* (1857), *Ueber die Verbesserung der Planetenelemente* (1858), *Ueber die Bestimmung der Sonnenparallaxe* (1875), *Mitteilungen der Breslauer Sternwarte* (1879), *Verzeichnis der Elemente der bisher berechneten Kometenbahnen* (1894). His original contributions were published, for the most part, in scientific periodicals.

**GALLISON, HENRY HAMMOND.** An American artist, died October 12, 1910. He was born in Boston in 1850 and studied art in Paris. He exhibited in London, Paris, Turin and in the Paris Exposition of 1900. At the latter exhibition he received honorary mention. His picture "Rising Mists," exhibited at Turin in 1902, was purchased by the Italian government for the National Museum. This was the first picture by an American artist to be so honored. He received a medal at the St. Louis Exposition in 1904.

**GALLIUM.** See ATOMIC WEIGHTS.

**GALSWORTHY, JOHN.** See LITERATURE, ENGLISH AND AMERICAN, *Poetry and Drama; Fiction.*

**GALVESTON, TEXAS.** See MUNICIPAL GOVERNMENT.

**GAMBIA.** A British crown colony and protectorate on the west coast of Africa. Area of the colony proper, 4 square miles; population, 8807. The area of the protectorate is variously estimated at from 3600 to 4500 square miles; population (estimate), 152,005. Capital, Bathurst, on the island at St. Mary. There are government and mission schools. Trade is largely with or through the adjoining French colony of Senegal; the exports are groundnuts, beeswax, hides, rice, millet, sweet potatoes, cotton, and rubber. Statistics for two years are given below in pounds sterling:

	Imports.	Exports.	Rev'ue.*	Expen.*
1907.....	£445,359	£408,467	£65,892	£57,729
1908.....	390,740	374,138	57,898	61,097

\* Year ending March 31.

Chief imports (1908): cotton goods, £68,871; kola nuts, £39,794; rice, £37,764; spirits, £5247; tobacco, £5937. Chief exports: groundnuts, £245,084; rubber, £1163. Tonnage entered and cleared, 418,441 (British, 301,287). Revenue from customs, £44,064. There is no debt. Governor (1910), Sir George C. Denton.

**GAME LAWS, 1910.** As few of the State legislatures were in session in 1910 the number of laws relating to game was less in that year than in the years when the legislatures of nearly all the States meet. Game measures were considered by all the legislatures in session, but in the case of Georgia all legislation failed. Five Canadian provinces modified their game

laws and changes were made through Orders in Council in British Columbia and Ontario.

**GAME PROTECTION.** In general, the game legislation of the year was favorable to game protection. Maryland, New Jersey and South Carolina took steps toward uniformity of seasons. The warden service was strengthened in Louisiana, Massachusetts, New York, Oklahoma, South Carolina, and New Brunswick. The growing scarcity of game was emphasized by the establishment of bag limits in Maryland, Massachusetts and South Carolina for the first time. A limit was placed on hares and rabbits in New York and there was a general reduction of bag limits in Louisiana. The latter State created two game preserves and New York extended the St. Lawrence reservation to cover State lands along the eastern end of Lake Ontario. Two novel features characterized the legislation of the year. Louisiana passed a law prohibiting the liberation of imported birds except upon special permission of the game officials, and New York provided a special fine of \$100 for the violation of its game laws by a non-resident or alien.

**OPEN SEASONS.** Maryland and New Jersey established practically uniform duck seasons. South Carolina established uniform seasons for all games practically throughout the State. In Massachusetts a week's deer season was opened in five counties. New York closed the deer season for three years on Long Island. South Carolina passed a measure giving absolute protection to does for five years and Louisiana placed black bears on its game list.

**LICENSES.** License measures were passed by Louisiana reducing the non-resident fee from \$25 to \$15 and established a \$10 resident market hunting license. British Columbia established a \$50 bird license good for seven months, and restricted its non-resident 5-week licenses to British subjects. Nova Scotia established a \$15 non-resident license for small game, and New Brunswick repealed its 25 cent resident deer license and also its special resident Westmoreland County license.

**FEDERAL LAWS.** Two important measures were passed by Congress. One of these established a Glacier National Park in the Rocky Mountains south of the international boundary line, and the other protected the seal fisheries of Alaska and incidentally transferred from the Department of Agriculture to the Department of Commerce and Labor charge of the Pribilof bird reservation.

#### GARBAGE AND REFUSE DISPOSAL.

Two of the larger cities of the United States, Milwaukee, Wis., and Columbus, O., completed notable plants for the disposal of city refuse during 1910. The Milwaukee plant affords a good example of the high-temperature type of incinerator, with the utilization of the resultant heat, and the Columbus plant is equally representative of the reduction process, with the recovery of grease and fertilizer tankage. The Milwaukee furnaces superseded older furnaces, and the latter had succeeded a reduction plant. The Columbus reduction works was the first plant of the kind designated and built originally by a city and is the second municipally-owned garbage reduction works in the country. For some years prior to and ending in April, 1906, the garbage of Columbus was treated at a privately-owned reduction works, and from 1906 to 1910 it was buried in land of a farm rented for that purpose by the city.

The Milwaukee incinerating plant was put in partial operation in April, 1910, and in full operation on May 12, 1910. It has a nominal daily capacity of 300 tons of mixed refuse, or garbage, ashes and miscellaneous rubbish. It is of the British type of furnace known as Heenan & Froude, but was built by the Power Specialty Co., of New York, after general designs by Hering & Fuller, New York, with Samuel A. Greeley as resident engineer. The contract requirements, all of which were fulfilled, called for the burning of 60 pounds of mixed refuse per square foot of grate surface; a minimum temperature of 1250° F and an average of 1500° F., and the evaporation of 1.25 pounds of steam from and at 212° F., for each pound of refuse burned. The operations of the first two months promised that enough steam would be produced by the furnaces to pay the operating and the fixed charges of the plant.

Ultimately, it is expected that one or more additional incinerators will be built at Milwaukee. For the present, all the garbage of the city is being collected separately and brought to the incinerating plant, and the same is true of the ashes and rubbish of portions of the city. The garbage is collected in steel boxes of 1½ cubic yards capacity, mounted on four wheels, the whole drawn by one horse. The ashes and rubbish are collected in two-horse, bottom-dumping wagons of 3 cubic yards capacity. At the incinerating plant the garbage boxes are lifted from the carts by an electric hoist, and carried into the building and dumped by an electric trolley crane. The ashes and rubbish wagons are dumped into boxes on the ground level and hoisted and dumped in like manner. The building is of concrete, both plain and reinforced, brick and steel, with a basement and first story about 100 feet square, and a second story smaller in floor plan. There is a radial brick chimney 10 feet in internal diameter and 154 feet high above the clinkering or main floor. There are four independent furnace units, each of 75 tons daily capacity, and four 200-h.p. boilers supplied with heat from the incinerating furnaces. The garbage, ashes and other refuse are dumped into storage hoppers on the second floor of the building, to be subsequently raked or shoveled out onto the mixing and charging floor, and fed to the furnaces through charging chutes, the contents of which are dumped mechanically on to inclined drying grates from which the mixed refuse is raked forward on to the burning grates. After the gases of combustion have passed from the various furnaces into a combustion chamber and been raised to a high temperature they go to the boilers, and thence to and through air heaters, which heat the air for the forced blast supplied to each furnace. Forced ventilation for the plant is provided by means of four 48-inch Sirocco fans, each having a capacity of 10,000 cubic feet per minute. The clinker from the furnaces is raked out through clinker doors on the ground floor and falls into clinker cars which run on tracks laid in the basement. Various recording instruments for furnace temperatures, amount of carbonic acid gas sent to the chimney and volume of air used for forced draft are provided. The resident engineer on construction was retained as superintendent of the incinerator, thus ensuring efficient operation and affording a marked contrast to the usual American city practice of employing the best engineering talent in design and con-

struction of public works and then entrusting the operation to political appointees. The cost of the Milwaukee incinerating plant was about \$210,000, or \$700 per ton of nominal daily capacity.

The Columbus reduction works were put in operation on July 20, 1910. They form a part of a complete system of garbage collection, horse-and-wagon and railway transportation, and means of final disposal, all (except railway track and locomotives) owned by the city. Unlike Milwaukee, the Columbus plant deals with garbage only. A total of \$290,000 of bonds was voted for the collection and disposal plant. The reduction plant alone, including a levee for flood protection and terminal tracks, cost about \$180,000. The reduction plant has a contract capacity of 160 tons a day, which was exceeded on the acceptance test.

The city of Columbus owns 34 covered garbage-collecting wagons, of which about 25 were in regular service in 1910. The wagon boxes are of steel. The city has built a two-story garbage station, 40 x 90 feet in plan, with track accommodation for two railway cars. The garbage wagons are hauled into this station by way of an inclined driveway and are dumped into the cars below by the aid of an electric hoist. The city owns four garbage cars, each of 1400 cubic feet or 40 tons capacity. These are hauled to the reduction plant, between 7 and 8 P. M. of each working day. A stable for one hundred horses, with offices, and with baths for the garbage men, adjoins the receiving and shipping station.

The Columbus reduction plant is located on the Scioto River, adjoining the city sewage-purification works, about four miles from the heart of the city. There is a green garbage building, 40 x 90 feet in plan, a main building, 76 x 162 feet in plan, a stable and a small office building. On arrival at the reduction plant, the garbage cars are weighed, then run into the green garbage building and dumped. After being sorted and drained the garbage is shoveled into conveyors which carry it forward and upward to the top of the main building, and dump it through swivel spouts into any one of eight digesters. These digesters have a capacity of 10 to 12 tons each, are 7 feet in diameter and 14 feet high, and are made of ½-inch steel plate, lined with 1½ inches of cement and tile to prevent damage by wear and acids. The digesters are steam tight and in them the garbage is cooked for about six hours with steam at an entering pressure of 60 to 70 pounds per square inch. The cooking releases the grease in the garbage. To separate the grease and water from the solid matter or tankage and the grease from the water several operations are required. First, the tankage is dropped into one of the two large metal roller presses. The grease and water thus expressed go to catch-basins and are then pumped to a series of six grease-separating basins. Here the grease rises to the top and is sent to two treating tanks, where it is heated and impurities removed. The grease is then pumped to storage tanks of which there are four, each of 15,000 gallons capacity.

The solid matters in the grease-separating tanks is pumped out, pressed, and sent to dryers. The tank water from the grease-separating tanks is sent to a triple-effect evaporator, and the resulting "stick" is also sent to the drying room. The digester tankage, after passing the roller presses, goes to and through revolving steam

jacketed driers, and then through a revolving screen. Next, the screened tankage and the "stick" or concentrated syrup already mentioned are put into one of two vacuum dryers and finally there results a fertilizer base, which, with the grease, forms the commercial product of garbage reduction works. During the latter part of 1910 percolating apparatus was being added to the Columbus plant, for the recovery of the considerable amount of grease still left in the tankage. This will be effected by the use of a volatile solvent, which latter will be recovered by condensation for use over and over again.

To supply steam for cooking the Columbus garbage three  $6\frac{1}{2} \times 20$  foot horizontal tubular boilers are provided. The presses, revolving dryers and screens, etc., are driven by independent motors. The electric current for these motors and for lighting the reduction works is supplied by the municipally-owned electric light plant, at  $1\frac{1}{2}$  cents per kilowatt hour. The vapors generated within the works are condensed in apparatus provided for the purpose and the odoriferous gases are burned under the boiler furnaces. The first few months of operation of the works indicated that the grease and tankage would pay all operating expenses and fixed charges of final disposal. The engineer for the design and construction of the plant was Mr. I. S. Osborne, who subsequently became engineer-in-charge of garbage and refuse disposal, under the Board of Public Service. Lengthy illustrated descriptions of the Milwaukee incinerator and the Columbus reduction works, written by the engineers in charge of construction, appeared in *Engineering News* (New York), for July 21 and November 17, 1910, respectively.

**GAY, WINCKWORTH ALLAN.** An American artist, died February 23, 1910. He was born at Hingham, Mass., in 1821 and was educated in the common schools. He began the study of art at the age of seventeen under Robert Weir at the United States Military Academy at West Point. He studied also in Paris and spent several years in Italy and Switzerland. In 1850 he returned to the United States where he opened a studio in Boston. He went to Japan in 1877 where he re-

mained three years. Much of his time was spent abroad. His pictures of New England scenery are the best of his works, and among the most notable of these is "The Mackerel Fleet off Beverly Coast" (1863).

**GEOGRAPHICAL SOCIETY, AMERICAN.**

A learned society organized in 1852 to investigate and disseminate new geographical knowledge, by discussion, lectures and publication; to encourage geographical exploration and discovery, and to establish in the chief maritime city of the country, for the benefit of commerce and navigation and the great industrial and material interests of the United States, a place where the means shall be afforded of obtaining accurate information for public use concerning every part of the globe. The society has over 1250 members. It has a library of over 40,000 volumes, which is constantly increasing. It awards two gold medals at the discretion of the Executive Council. These medals are bequests from General Cullum and Charles P. Daly and are called the Cullum and Daly medals respectively. The latest recipients of the Cullum medals are Sir Ernest H. Shackleton and Professor Hermann Wagner, and of the Daly medal Col. C. Chaillie-Long. The society erected during the year a new and spacious building at the corner of 156th Street and Broadway, New York City. The land for this was presented by Mrs. Collis P. Huntington. The building will cost about \$250,000. It will afford five times the space available in the present building, which was constructed by the society about ten years ago. The collections of the society are also open for free reference to students and others properly introduced. The officers are as follows: President, Archer M. Huntington; vice-presidents, John Greenough, J. Hampden Robb, Anton A. Raven; editor, Cyrus C. Adams; librarian, Frederick S. Dellenbaugh.

**GEOGRAPHIC SOCIETY, NATIONAL.** A learned body founded in 1888 for the publication of the results of geographic exploration and research. The data gathered are published in an illustrated monthly magazine, the *National Geographic Magazine*. The Society maintains a library at Washington at its headquarters. Here gold medals are awarded and a series of addresses is given. During 1910 the membership of the society advanced to 74,000, thus giving it rank as the largest scientific organization in the world. The society maintained in 1909 a large expedition in Alaska headed by Professor Lawrence Martin of the University of Wisconsin. An account of the researches of this expedition was published in the *National Geographic Magazine* in 1909-10. The annual dinner of the society was given in honor of the United States army and the discovery of the art of aviation. The guests of honor were the President of the

United States, the German, British and Mexican Ambassadors, Major-General Leonard Wood and Mr. Wilbur Wright. During the year a series of 21 lectures, which included lectures by Theodore Roosevelt, George Kennan, Dean C. Worcester, Secretary of the Interior of the Philippine Islands, Col. George Goethals, Chief Engineer of the Panama Canal, and Hon. Charles W. Fairbanks, were given before the society. The gold medal was awarded to E. H. Shackleton for exploration in the Antarctic, on March 23, 1910. The officers in 1910 were Henry Gannett, President; C. H. Tittmann, Vice-President; O. P. Austin, Secretary; John Joy Edson, Treasurer; Gilbert H. Grosvenor, Editor and Director.

**GEOLOGICAL CONGRESS, INTERNATIONAL.** See GEOLOGY.

**GEOLOGY.** The contributions to geological knowledge during 1910 may fairly be considered as commensurate in interest and importance with the record for any of the few preceding years. No very remarkable discoveries can be ascribed, perhaps, to the year's activity; progress was rather the result of a great number of investigations by individual workers and public surveys based upon established principles. Governmental surveys, which of late have greatly increased their field of operations, naturally contributed a large share to this advancement. Their contributions included not only maps and descriptions of areal geology, but studies of mineral deposits, water resources, and allied subjects as well as much of more purely scientific interest.

**INTERNATIONAL GEOLOGICAL CONGRESS.** A leading event of the year was the convening in Stockholm of the eleventh International Geological Congress, which holds triennial sessions. Nearly 800 members from all the leading countries were in attendance, and the meeting was the most successful one that has been held. The president of the congress was Prof. G. de Geer of the University of Stockholm, and the secretary J. G. Andersson, Director of the Geological Survey of Sweden. The attention of the members was directed to a limited number of subjects, within such departments as glacial geology, the Pre-Cambrian formations and the geology of the arctic regions, which were of particular concern to the Scandinavian countries. Preliminary to the congress a committee of Swedish geologists had prepared an exhaustive monograph on the iron ore resources of the world. An important work relating to the changes of climate since glacial times was also issued in connection with the meeting. It was voted to hold the next congress in 1913 in Canada.

**DYNAMICAL GEOLOGY.** The principle of isostasy in its relation to the figure of the earth was treated by J. F. Hayford, who analyzed a great number of gravity determinations made by the Coast and Geodetic Survey in recent years. The results as interpreted by Hayford apparently demonstrate the actuality of isostasy, or at least are best explained in the light of that principle. It would appear, therefore, that the earth's crust is in a delicate state of equilibrium and that the continental land areas are maintained in their position above sea-level by their deficiency of density, that is they are buoyed or floated on the substratum and not held in place by simple rigidity.

**CHEMICAL DENUDATION.** F. W. Clarke contributed an analysis of existing data on the subject of chemical denudation and showed that

former estimates by Reade, Murray and others as to the amount of saline matter carried in solution by streams which reach the sea should be revised. Denudation values were calculated for 28,000,000 square miles approximately of land surface distributed among the different continents; these gave a yearly mean of 68.4 metric tons per square mile. On that basis the total amount of saline matter carried by river drainage from the land surface of about 40,000,000 square miles is 2735 millions of metric tons a year. Aside from its bearing upon the waste of the land by stream agency, the calculation may be used in connection with other data to redetermine the age of the earth, as discussed in another paragraph of this article. Clarke placed the mean sodium content of the dissolved solids in river water at 6.4 per cent. The total amount of saline matter held in the ocean may be estimated at  $46,188 \times 10^{12}$  tons, of which  $14,130 \times 10^{12}$  tons consists of sodium.

From a compilation of data on the work of streams in lowering the land surface, R. B. Dole and H. Stabler found that the whole area included within the United States is undergoing denudation at an average rate of one inch in 760 years. Although this figure seems small enough, it becomes very significant when translated into tonnage of material transported by the streams, which totals no less than 783,000,000 tons each year, equivalent to 350,000,000 cubic yards of rock. The rate of denudation of course varies widely in different sections. The highest figure is reached in the southern Pacific basin, where the annual amount removed averages 177 tons for each square mile. The northern Atlantic basin comes next with 130 tons a square mile, and the lowest average is found in the Hudson Bay basin with 28 tons a square mile.

**GLACIAL GEOLOGY.** The controlling conditions of glaciation during the Pleistocene and earlier periods which were characterized by the formation of extensive ice-sheets was discussed by M. Manson, who expressed the view that the ice invasions were independent of a zonal distribution of temperatures such as obtains at present. The glacial phenomena occur without reference apparently to latitude, except in the last, or Pleistocene, period, when a solar control of temperatures may have been inaugurated. The Cambrian and Permo-Carboniferous glaciations extended far into the temperate and even into the tropical zones, so that very probably they were not influenced by climatic belts. On the other hand, the range of temperature must have been moderate throughout the world. Although it is not doubted that the heat emitted by the sun has varied in geological time, the conditions that gave rise to the glacial periods can be best explained on a meteorological basis, such as a state of persistent cloudiness. The effect of this would be to screen off most of the solar heat and to prevent radiation, thus eliminating the tendency to zonal distribution of temperatures.

A paper by G. de Geer brought out a new aspect of glaciology by demonstrating the possibility of using morainal accumulations as a means of computing time. A study of these deposits in Sweden showed that they are composed of layers in recurrent series, each series representing the increment of material of a single year. It was found possible to correlate the layers of adjacent moraines and to derive in this way a time-scale by which to reckon the interval that has elapsed since the ice-sheet retreated by

successive stages to the north. The lapse of time since the disappearance of the ice from southern Sweden was estimated at 12,000 years.

Evidences of extensive glaciation during the Triassic period were reported by Ball and Shaler to have been discovered in Central Africa. A series of rocks in the Lualaba valley of the Congo basin has a conglomerate at the base that is made up of an unassorted mixture of pebbles and boulders showing glacial characters. The rock below the conglomerate is smoothed and deeply scored on the surface, as if by the action of a moving ice sheet. The source of the glacier is supposed to have been in the mountains south-east of Kabambare. Permanent ice fields are found at present in Central Africa only on the three highest mountains—Kilimajaro, Ruwenzori and Kenia, at elevations above 13,000 feet. The existence of a glacial epoch in the Permo-Carboniferous of South Africa in connection with the later Triassic epoch in the heart of the continent indicates a prolonged period of glaciation over an extensive area.

**PHYSIOGRAPHY.** With the fourth volume of *Das Antlitz der Erde* (issued also in English under the title *The Face of the Earth*) Eduard Suess brought to completion his great masterpiece of geological research. The nature of this work has already become widely known through the preceding volumes, the first of which appeared over a quarter of a century ago. The latest installment completes and unifies the exposition of the earth's structural features as unfolded in the earlier volumes, making use of new data where available, and presents the author's conclusions on the subjects of climatic changes, distribution of life and other fundamental problems.

**STRATIGRAPHY.** The paucity of fossil remains in rocks older than the Cambrian is one of the striking features of the geological record. Some traces of organisms have been found in Pre-Cambrian rocks, it is true, but they are less abundant and less varied as to development than would be expected from the extensive fauna which marks the beginning of Paleozoic time. The existence of a highly differentiated fauna in the lowest Cambrian strata is presumptive evidence that life must have flourished previously for a very long period. In discussing the reasons for the seemingly abrupt appearance of the Cambrian fauna on the North American continent, C. D. Walcott expressed the view that it is to be explained by physical conditions with reference especially to the character of the sedimentation during late Pre-Cambrian or Algonkian time. The Algonkian rocks are mainly of terrigenous origin and are considered as having been deposited in epicontinental seas and lakes of fresh or brackish water. At the time of their deposition the American continent was situated with regard to sea level about as at present, or it may have been even more elevated, so that the oceanic waters could not gain access to the interior parts. Inasmuch as life originated and developed for some time, most likely, in the open ocean, there was no opportunity for the preservation of its remains in the present known Algonkian areas; but it may be represented in the strata that are buried under the oceans. At the close of Algonkian time a marine invasion took place and the life that had developed during that period has been preserved in the lower Cambrian deposits. Walcott proposes the term Liplalian to be used for the era

of unknown marine life and sedimentation which preceded the Cambrian.

**LAND FORMATIONS.** The evolution of the North American continent was treated very comprehensively by C. Schuchert in his *Paleogeography of North America*. The work gives a history of paleogeography from the first maps which were prepared by J. D. Dana down to the present; it includes 53 maps illustrative of the changes through which the continent has passed during the various periods of geological time since the Cambrian. The maps with the explanations in the text also afford a conception of the topographic relief of the area for the corresponding periods.

The possible existence of a land connection in Tertiary time between Scotland, Ireland, Greenland and Labrador was discussed by R. F. Scharff who brought forward evidences of both physical and biological nature in its favor. It has been found that a bank (Rockhall bank) with an average depth of 100 fathoms exists far out in the Atlantic to the west of Scotland. Dredging on this bank brought to light molluscs of shallow-water habits that could not live there under present conditions. It is also stated that the submerged platforms bordering the British Isles show river valleys and canyons of an ancient land surface, and the same has been asserted regarding the Atlantic continental shelf of North America. From the standpoint of biology the distribution of plants and animals on the two sides of the Atlantic requires for its explanation the assumption of such a land bridge in late geological time. Southern Greenland contains many European plant species. The Faroes furnish species that must have come from Greenland and North America.

**ARCTIC CLIMATE.** The climate of the arctic regions in past geological ages is a subject to which much interest is attached by the fact that the strata found in the higher latitudes often reveal evidences of an abundant fauna and flora. The existence of a varied animal life under arctic conditions is perhaps not so surprising, as in fact the polar seas at the present time teem with invertebrates, and even land animals like the musk ox and reindeer are able to maintain themselves far north of the Arctic circle. But it is difficult to understand how the extensive flora found in the Carboniferous, Triassic and Jurassic rocks could have existed under conditions similar to those of to-day. Most geologists who have studied the problem have concluded that the climate during those periods was actually warmer. Another explanation that has been considered by a smaller number as applicable is that the plants did not grow in place, but their remains were brought from southern latitudes by northerly flowing ocean currents or by streams. A careful examination of the evidences was made by A. G. Nathorst, who found that in most instances the plants are indigenous to the regions where their remains now occur. In only one or two places, as in Greenland and possibly Spitzbergen, are the remains associated with marine deposits, but these exceptions have not much importance for evidence since elsewhere beds of corresponding age show characters of fresh-water deposits. The facts lend support to the view that the climate during some periods must have been comparatively mild.

**FOSSIL MAMMALS.** The discovery of fossil mammals of Pleistocene age in cavern deposits of central Cuba, reported by Prof. de la Torre

of the University of Havana, attracted attention as their existence within the island had not, hitherto, been definitely established. Apart from its paleontological interest the discovery has importance in that it may be considered as evidence of a recent connection between the West Indies and the continent. Other vertebrate remains were recently found on the island of St. Martin.

**PETROGRAPHY.** Experiments on the flow of rocks under pressure were described by Adams and Coker. It is a matter of common observation that the older rocks, which sometime have been deeply buried in the earth and there subjected to powerful stresses, have been contorted and folded as if they were plastic substances like clay or wax. The manner in which this deformation takes place has not been clearly understood. Some geologists have held that there is really a molecular flowage of material, the rigidity of the rocks being overcome by the intense pressure. Others have attributed the deformation to effects of crushing followed by a recementation of the fragments from mineral matter deposited by underground waters, or else to a continuous process of solution and redeposition of the rock minerals. The agencies of heat and water have usually been considered essential in the development of such secondary structures. In the present experiments, which were made on an elaborate scale under the aid of the Carnegie Institution, it was found that structures identical with those found in nature could be reproduced by artificial means, and not only with the softer rocks like marble and limestone, but with granite, diabase and other very hard kinds. Pressures ranging from 120,000 to 300,000 pounds per square inch were employed under different conditions of temperature, moisture and time. The rocks were made to flow so as to show a marked foliation, and the resultant products still retained a very considerable part of their original strength. It was found that the presence of water was not essential to the process, and in fact under most conditions had very little influence. Heat, however, tended to facilitate deformation and the product was relatively stronger than if the deformation had been carried out at ordinary temperatures. The element of time also exercised an influence, the product showing a gain of strength with slow compression as compared with rapid compression.

R. T. Chamberlin determined the nature and relative proportions of the different gases occluded in rocks. It was found that rocks characterised by high percentages of iron and magnesian minerals contained the most gas. The author of the paper inclined to the view held by Suess that the water and gases found in igneous rocks have been brought up from the earth's interior and are an integral part of the magma.

**ECONOMIC GEOLOGY.** In this department the most important contribution for the year, undoubtedly, was *The Iron Ore Resources of the World* already mentioned as one of the works initiated by the Stockholm Geological Congress. The results of the investigation, in which over 50 leading authorities participated, were published in two volumes of text and one of maps, under the editorship of J. G. Andersson. The description of the ore occurrences makes the work of great value to the geologist for comparative study, and the information on the volume and the character of the deposits will be welcomed as the first serious attempt to formulate an

estimate of the supplies of iron ore available for our future industrial needs. The actual known reserves of ore for all the different countries are estimated at 22,408 millions of metric tons, which will be exhausted in less than two centuries at the present rate of consumption or in 60 years if the consumption should continue to increase in the ratio of the past. There are potential reserves of ore, not now available but which may become so under changed conditions, sufficient to supply the requirements for a much longer time.

R. A. F. Penrose contributed some interesting data on the occurrence and causes of ore shoots, by which name it is customary to designate the richer parts of metalliferous veins or other mineral deposits. These localized aggregations of ore are due to various chemical and physical influences, acting singly or in combination. Segregation of the heavier components during the cooling of a magma; the occurrence of local vents, like those of fumaroles and hot springs; structural features of the wall rocks; the nature of the country rock itself; and secondary alteration are some of the causes assigned in the paper.

The theory of secondary enrichment of ore deposits was the subject of an extended discussion by American geologists which served to place it on a firm basis as well as to facilitate its application. The theory, it may be explained, refers to the downward migration of the metallic constituents of an ore body after their original deposition. It was shown that the process had been effective in many of the copper deposits of the West, copper minerals being especially prone to such migration owing to their easy solubility in the presence of ground waters. To this agency may be ascribed the very rich accumulations of copper ores, like those of Butte, that are not infrequently encountered below a zone of lean or almost barren material. Secondary enrichment would seem to be less effective in the case of the more insoluble minerals, like gold, silver and lead, though some of the writers believed its influence to be recognizable in some instances.

**AGE OF THE EARTH.** In an important contribution to the subject of the age of the earth, G. F. Becker reviewed the results and methods of Kelvin, Joly and others who have attacked the problem and gave some new determinations based on data more reliable than those hitherto available. As a starting point for calculation, the beginning of the earth has been assumed usually at the time when it had so far cooled as to permit the accumulation of water on its surface, in the form of permanent oceans. The problem then may be resolved into a calculation of the age of the ocean. One method of attack is that followed by Joly, who computed the quantity of sodium present in sea water and the amount annually contributed by rivers; the former total divided by the latter gave a value of 97,600,000 years as the probable age of the ocean. Becker would modify the method on the ground that the accumulation of sodium was probably more rapid in early ages, when larger areas of feldspathic rocks were exposed to atmospheric denudation, than at present. Thus, assuming that the accumulation is an asymptotic process, a modified value of 74,000,000 years is deduced for the maximum age of the ocean. The weak point in this method lies in the possibility that the primitive ocean was salt, or that it contained continents within its basin; either pos-

QUEEN MARY OF ENGLAND

KING GEORGE V. OF ENGLAND

20  
19

sibility would affect the accuracy of a minimum value, though it would not alter that given for a maximum. If neither possibility was realized, the minimum would be about 46,000,000 years. The method of estimation based on the progress of refrigeration of the earth from a molten state, as developed by Lord Kelvin, may be modified in the light of recent work on isostatic compensation, and on that basis Becker finds a maximum of 75,000,000 years and a minimum of 55,000,000 years. Both methods thus yield results which are close enough to be mutually confirmatory. A third means of attack is based on the time required for the deposition of the stratified rocks. Walcott has placed the opening of the Cambrian period at 27,640,000 years ago; Becker would assign to Pre-Cambrian time a similar order of magnitude, making the total between 50,000,000 and 65,000,000 years. The results obtained by the different methods converge toward a value of about 60,000,000 years, which may be accepted as the nearest approximation possible with the data at hand.

**GEORGE V.** King of the United Kingdom of Great Britain and Ireland and of all the British Dominions beyond the seas, Emperor of India, succeeded to the throne on the death of his father, King Edward VII, May 6, 1910. He was born on July 3, 1865, the second son of King Edward. He entered the direct line of succession only after the death of his elder brother, the Duke of Clarence, in 1892. He was baptized with the names of George Frederick Ernest Albert. With his elder brother, the Duke of Clarence, he entered the navy as a cadet in 1877, and after spending two years in the training ship *Britannia* started for a three years' voyage around the world on board the *Bacchante*. He was made a midshipman on the *Canada* in 1883. This vessel was then on the North American and West Indian stations. In 1885 he became a lieutenant, and in 1890 was given a separate command on the gunboat *Thrush* on the North American Station. In 1891 he was made commander. In the following year, as noted above, through the death of his elder brother, he became heir to the throne and took his seat in the House of Lords as the Duke of York. In the same year he took command of the *Melampus* for the naval manœuvres. In May, 1893, his engagement to the Princess Victoria Mary of Teck was announced. This Princess had previously been the fiancée of the Duke of Clarence. The marriage was celebrated at St. James's Palace on July 6, 1893. During 1898 the Prince for some time was in command of the battleship *Crescent* attached to the Channel Squadron. He was promoted to the rank of rear-admiral in 1901 and was appointed Colonel-in-chief of the Royal marine forces. On the death of Queen Victoria in 1901 he succeeded his father as the Duke of Cornwall. In 1901 he undertook, as Duke of Cornwall and York, the great Imperial Mission through which he became widely known to his subjects in the Over Seas dominions of the Crown. He visited Australia where he opened the first Parliament of the Commonwealth and then went to New Zealand and finally to Canada and Newfoundland. On November 9, 1901, the birthday of King Edward, he was given the title of Prince of Wales and Earl of Chester. On the return of the Prince from his tour to Australia and Canada, he was entertained by the London Corporation at the Guildhall, December 5, 1901. On this occasion he delivered a memor-

able speech beginning with the phrase "Wake up, England." In June, 1902, he was promoted to the rank of general. On October 19, 1905, in company with the Princess of Wales, he left London for a visit to India and landed at Bombay on November 9. This tour was a great success and everywhere he was received with the greatest enthusiasm. At Calcutta he laid the foundation stone of the Victoria Memorial Hall and took part in many other important ceremonies in different parts of India. On the return home the Prince paid a visit to the Khedive of Egypt at Cairo. On his arrival in England the Prince received a civic welcome at the Mansion House where he said in a speech of unusual length and interest that "the task of governing India would be made easier if we, on our part, infuse into it a wider element of sympathy." The King, as Prince of Wales, was not so well known as his father when he occupied the same position. This was largely due to his temperament which inclined him to a more serious mode of life. It was well known, however, that he was a student of public affairs and had a deep interest in the welfare of the empire.

The King's marriage was a happy one and his chief enjoyment has been in the retirement of his family. There were born to the King and Queen five sons and one daughter: Prince Edward Albert, born June 23, 1894, now heir-apparent; Prince Albert Frederick, born 1895; Princess Victoria Alexandra, born 1897; Prince Henry, born 1900; Prince George, born 1902; and Prince John, born 1905. For details of the Coronation, see GREAT BRITAIN.

**GEORGETOWN UNIVERSITY.** An institution of higher learning at Washington, D. C., founded in 1789. The total number of students for the year 1909-10 was 1085, while the faculty numbered 158. Among the notable changes in the faculty during the year were the following: Reverend John F. Quirk was elected Vice-President to succeed Reverend John J. Fleming, resigned; Hon. Hannis Taylor was appointed to the chair of international law in place of Hon. Wade Ellis, resigned. The following noteworthy benefactions were received during the year: From E. Francis Riggs, \$10,000 for the library; from A. Lisner, \$25,000 for the hospital. A seismograph station with both vertical and horizontal instruments was installed during the year. The capacity of the law school was doubled. There are about 100,000 volumes in the library. The income for the current year was \$328,331. The President is Rev. Joseph J. Hannel, S. J.

**GEORGIA.** One of the South Atlantic Division of the United States and one of the thirteen original States. It has an area of 59,265 square miles of which 5040 square miles are water. The capital is Atlanta.

**POPULATION.** The population in 1910, according to the Thirteenth Census, was 2,609,121 as compared with 2,216,331 in 1900 and 1,837,353 in 1890. The increase in the decade 1900 to 1910 was 17.7 per cent. The State ranks tenth in point of population whereas in 1900 it ranked eleventh. The population of the larger cities and towns will be found in the article UNITED STATES CENSUS. The increased industrial importance of the State is reflected in the gain in population in several of the larger cities, notably in Atlanta and Savannah, as will be seen from the tables in that article.

**MINERAL PRODUCTION.** The chief products of

the State are coal and iron. In 1909 the total production of coal was 211,196 short tons, having a spot value of \$298,792, a decrease of 53,626 short tons in quantity and \$65,487 in value from 1908. The coal production in the State has shown a decreasing tendency since 1903. The production in 1909 was the smallest since 1897. During the year 1909 there were two fatal and 56 non-fatal accidents in the coal mines of the State. Coke is also manufactured in considerable quantities and large amounts of asbestos and bauxite are mined. Gold was produced in 1910 to the value of \$25,488, as compared with a value of \$43,400 in 1909. A small quantity of silver was also mined. Among other products of the mines and quarries of the State are Portland cement, pyrite, precious stones, copper, lead, and mineral waters.

**AGRICULTURE.** The acreage, production and value of the principal crops in 1909-10 are shown in the following table:

	Acreage	Prod. bu	Value
Corn, 1910.....	4,532,000	66,714,000	\$51,257,000
1909.....	4,400,000	61,160,000	52,598,000
Winter			
Wheat, 1910.....	260,000	2,730,000	3,549,000
1909.....	245,000	2,450,000	3,552,000
Oats, 1910.....	343,000	6,243,000	3,996,000
1909.....	350,000	6,650,000	4,722,000
Rye, 1910.....	14,000	146,000	204,000
1909.....	4,000	88,000	66,000
Rice, 1910.....	4,200	100,000	87,000
1909.....	10,000	820,000	861,000
Potatoes, 1910.....	10,000	810,000	810,000
1909.....	87,000	122,000a	2,001,000
Hay, 1910.....	87,000	117,000	1,849,000
1909.....	3,500	2,380,000b	547,000

**EDUCATION.** The total enrollment of pupils in the schools in the year ending December 31, 1909, was 547,912. Of these 316,315 were white, and 213,386 were colored. The total attendance was 211,854 white and 145,856 colored. The average monthly salaries of white male teachers was \$58.34; of white female teachers, \$37.48; colored male teachers, \$26.37; and colored female teachers, \$19.55 in the counties. In the cities the average monthly salary of the white male teachers was \$104.32; female, 147.76; colored male teachers, \$45.53; and colored female teachers, \$25.83.

The legislature of 1910 passed several important measures relating to education. These were chiefly concerned with raising money by taxation for school purposes.

**POLITICS AND GOVERNMENT.** The Georgia legislature convenes on the 4th Wednesday in June each year. The session of 1910 began on June 22 and lasted 50 days, the constitutional limit of the annual session. Several important measures were passed, chiefly of a local nature. On July 18 the income tax amendment to the constitution was ratified by the Assembly, following favorable action by the Senate.

**ELECTIONS.** Democratic primaries were held on August 23, for the nomination for governor of the State. Hoke Smith, former governor, was the candidate against Governor Joseph M. Brown, who wished the renomination. Mr. Smith, then governor, had been defeated two years before by Brown. It was a fight to get back by Smith, and to stay in by Brown.

While Mr. Smith was governor in 1908-9 he secured laws for disfranchising negroes, and for drastic regulation of elections, closing registration books six months before elections. Brown opposed the six months closing, holding that 90 days was enough.

On Brown's succession to the governorship he urged the repeal of this law, but the legislature refused. It was on these issues that the campaign was waged. The result was a victory for Mr. Smith and he accordingly became Democratic nominee for the governorship which, in Georgia, was practically equivalent to election. The primaries were held at the same time for seats in Congress and a notable result was the defeat of Congressman Livingston, one of the oldest members of the House in point of service. He was defeated by W. Schley Howard. Mr. Livingston's defeat was attributed to the fact that he had supported Speaker Cannon in the fight on the rules in the House contrary to the wishes of his party in the State. Tom E. Watson, the former Populist, made a strong effort to defeat Congressman Hardwick of the Tenth District, but in spite of his efforts the latter was renominated. Mr. Watson has been for many years a notable figure in State politics, and it was considered that his influence was diminished, if not entirely eliminated by the victory of Mr. Hardwick. The Democratic State Convention which met in September indorsed all the measures advocated by Smith while he was governor and indorsed a plank in the platform asking the railway commission to secure cheaper rates from the ports to the interior. The vote for Smith in the convention was 233 against 135 for Governor Brown. The Brown delegates left the hall after the roll call. In spite of the fact that he was defeated in convention, many of Brown's supporters ran him for governor as an Independent Democrat, although he voted for the regular ticket. On October 5, the elections for governor were held and resulted in a decisive victory for Mr. Smith. His majority exceeded 75,000. Mr. Brown's vote throughout the State was very small. In some counties not a ballot was cast for him. All the Democratic nominees for State and county offices were elected. Owing to the candidacy of Mr. Brown the vote was much larger than that normally cast in the general elections, which is usually considered a matter of form only. Three constitutional amendments were adopted at the election. One of these provides that counties may levy taxes in support of high schools. The others are local in effect.

Alexander Stephens Clay (q. v.) United States Senator from Georgia, died November 13, 1910, and Governor Brown appointed former Governor Joseph M. Turrell to fill out the unexpired term.

An important decision affecting the enforcement of prohibition in the State was handed down by Judge Newman of the United States Circuit Court. He decided that government gauger Stegall need not testify before a Georgia grand jury as to violation of the prohibition law. This official refused to testify before the Dade county grand jury in relation to the operation of a "wildcat" still and was sent to jail by Judge A. W. Fite. He was brought before Judge Newman on a writ of habeas corpus, who rendered the decision referred to.

**STATE OFFICERS.** Governor, Hoke Smith; Secretary of State, Philip Cook; Treasurer, William J. Speer; Comptroller and ex-officio

Com. of Insurance, W. A. Wright; Attorney General, Thomas S. Feeder; Supt. of Education, M. L. Brittain; Commissioner of Agriculture, Thos. G. Hudson—all Democrats.

**SUPREME COURT.** Chief Justice William H. Fish; Beverly D. Evans, Presiding Justice; Associate Justices, J. H. Lumpkin, M. W. Beck, and Samuel C. Atkinson; Clerk, Z. D. Harrison—all Democrats.

**STATE LEGISLATURE 1911.** Democrats, Senate, 43; House, 182; joint ballot, 225; Republicans, Senate, 1; House, 1; joint ballot, 2; Democratic majority, Senate, 42; House, 181; joint ballot, 233.

**GEORGIAN BAY CANAL.** See CANADA, *Industrial Affairs.*

**GERHARDT, DAGOBERT VON.** A German soldier, poet, and novelist, better known under the pen-name Gerhard von Amyntor, died February 24, 1910. He was born at Liegnitz in 1831. After attending the University he entered the Prussian army and advanced to the rank of major. He was severely wounded in the assault on the fortifications of Düppel during the Danish War of 1864 and in 1867 he was employed by Moltke on the General Staff at Berlin. He served in the Franco-German War, 1870-71. He became known chiefly through his numerous novels, such as *Der neue Romanzero* (2d ed. 1883); *Die Cis Moll Sonate* (1891), and *Ein Kampf um Gott* (1902). His earlier works include the *Hypochondrische Plandereien* (4th ed. 1875, new series; 3d ed., 1890).

**GERMAN ARCHITECTURE.** See ARCHITECTURE.

**GERMAN BAPTIST BRETHREN.** See BRETHREN, CHURCH OF.

**GERMAN DRAMA.** See GERMAN LITERATURE.

**GERMAN EAST AFRICA.** A German protectorate bordering upon the Indian Ocean. Estimated area, 365,000 square miles; estimated population, 7,000,000, largely of mixed Bantu race. Europeans (1908), 2845. Arabs, Syrians, and East Indians inhabit the coast regions. Capital, Dar-es-Salaam, with 24,000 inhabitants; Tabora has 37,000; Ujiji, 14,000; Tanga, 5690 (all estimates). Government schools (1908), 31, with 14 European and 77 native teachers and 3821 pupils. The mission schools have over 16,500 pupils. German plantations raise cacao, coffee, vanilla, tobacco, rubber, sugar, tea, cotton, cocoanuts, cardamon, cinchona, and fibre plants. There were (1905), 523,052 cattle and 3,380,492 sheep and goats. Minerals are known to exist, and large quantities of gems. Imports (1908), 25,786,771 marks (cotton, rice, food-stuffs, hardware, and iron); exports, 10,873,856 marks (rubber, 991,724 marks; copra, 800,202; ivory, 561,946; coffee, 801,462; sisal, 2,685,633; wax, 699,309). The trade is mainly with Zanzibar and Germany. Vessels entered (1908), 1057, of 1,507,427 tons; besides 4186 dhows, of 87,669. The railway from Tanga to Muhesa, Korogwe, and Mombo is 82 miles long; the extension to Buiko (opened July, 1909) and from Dar-es-Salaam to Mrogoro, 130 miles. An extension from Mrogoro to Kilimatinde (240 miles) is building. Telegraph lines, 1500 miles; offices, 26. Post-offices, 39. Revenue and expenditure for the year 1909-10, estimated at 31,759,000 marks (including imperial subvention of 3,579,

000). Governor (1910), Baron von Rechenberg. See EXPLORATION, paragraphs on *Detailed Surveys of Africa*, and *SLEEPING SICKNESS.*

**GERMAN EVANGELICAL SYNOD OF NORTH AMERICA.** A religious denomination, founded in 1840 at Gravois Settlement near St. Louis as the Evangelical Church Association of the West. It was organized by six German pastors for the purpose of making provision for the religious needs of the pioneer German immigrants. It united successively with the German Evangelical Church Association of Ohio, 1858, and the United Evangelical Synod of North America. Doctrinally this synod represents the Prussian Union of 1870. The strength of the organization, which comprises eighteen districts, covering almost all the States of the Union and parts of Canada, is greatest in the Central and North Central States. The most recent statistics show 1034 pastors, 1321 churches, 259,593 communicants and 114,372 Sunday school scholars. The total value of church property in 1910 was \$13,281,202; the amount contributed for the maintenance of churches was \$1,647,468; for church work and benevolences, \$155,181. Foreign missions are actively carried on in the Central provinces of India by nine men missionaries, 8 women missionaries, 67 native helpers and 114 native teachers. The denomination maintains Elmhurst College at Elmhurst, Ill., and Eden Theological Seminary at St. Louis. The work of the synod, which was formerly carried on exclusively in the German language, is now, to a considerable extent, being done in English, especially in the large cities. The official organs are *Der Friedensbote* and *The Messenger of Peace*. A number of other periodicals, covering all departments of church work, are issued in both languages. Charitable institutions are maintained for orphans, superannuated ministers and the widows and orphans of deceased ministers in different parts of the synod.

**GERMANIUM.** See ATOMIC WEIGHTS.

**GERMAN LITERATURE.** To the tumultuous pace of a decade ago the even tenor of literary life in Germany during the past year offers a striking contrast. All sensationalism, either critical or commercial, seems to have been discarded; it has had no secessionist manifestoes nor clamorous advertisements. It has lacked the mild excitement furnished by an exceptionally great seller or an unusual stage hit. Even Frenssen's latest and very creditable work, *Klaus Hinrich Baas*, which at the end of the previous year had promised to outrun its competitors, rapidly disappeared from the list of books most in demand.

None of the plays of the year have held the boards so long and so successfully as Ludwig Thomas's *Moral* in 1908-9 and *Alt Heidelberg* in a previous season, not to mention the success of *Die blaue Maus*. The dramatic world had not even been stirred by disputes over a prize competition as it was in 1908 at the distribution of the Schiller prize. The annual report on the repertoire of the German stage for the year ending in August, 1909, had proved that the French farce, or its German off-spring, and the musical comedy of *The Girl and the Kaiser* type, hold sway abroad as they do in America; and a glance at more recent statistics corroborates the inference.

The only book that profoundly agitated the minds of German readers has been Enrica Händel-Mazetti's story *Die arme Margaret*, which induced the Catholic press to accuse the author of Modernism and in return called forth from her a protest and the statement that her writings are firmly anchored in the Roman-Catholic faith. Another incident would ten years ago have aroused a storm of indignation, but passed by almost unnoticed; it was the libel case of a prominent publisher against the official organ of the conservative "Centre," which had called his publications pornographic, among the works thus branded being those of Stendhal, the philosopher Kierkegaard and the nature-writer Bölsche. Nor did the distinction of Paul Heyse by the Nobel prize call forth any comment from the young generation which had so often made him the butt of unwarranted animosity, yet the literary activity of the country has been in no way smaller than in previous years; on the contrary, the bulk of it seems greater than ever, and the unavoidable discrepancy between quantity and quality is not too much in evidence.

**FICTION.** Of the novels of the year the one which appeared at the beginning and the one which was published shortly before its close are likely to dominate the market for some time. *Die arme Margaret* by Enrica Händel-Mazetti is a story of the crusades distinguished by unusual dramatic intensity and tender poetic feeling. *Emanuel Quint* by Gerhart Hauptmann is the first long novel from the pen of the author and is bound to excite profound interest, his hero being of the Nazarene type and the record of his life offering a reply to the questions "What would Christ do in the World to-day?" and "What would the World do to Christ to-day?" The work is proof that in spite of his recent dramatic failures Hauptmann has not stood still, but developed in a new direction. Among novels with a historical setting Ricarda Huch's *Das Leben des Grafen Federico Gonzaloni* is a fair specimen of the author's exquisite style. The poet Friedrich Lienhard has appeared as the author of a novel of the French Revolution in an Alsatian milieu, Oberlin, suggesting the spirit of the time from the æsthetic period antedating the upheaval to its religious postlude. Another poet, Rainer Maria Rilke, makes a symphony of life and death out of the story of an old Danish nobleman, called *Die Aufzeichnungen des Malte Laurids Brigge*. While these stories deal with the past and the present there have been at least two attempts to give a forecast of the future. Wilhelm Hegeler's *Die frohe Botschaft* is a Utopian novel ranking artistically as high as previous works of the author; Alexander Ular's *Die Zwergenschlacht*, however, suggesting a world's peace trust, is devoid of literary merit. Novels deriving their interest mainly from the more or less effective suggestion of the place and the period of the story are very numerous; among them are Hermann Anders Krüger's story of Herenhutian life, *Kaspar Krumholtz*, Karl Hans Strobl's story of the Silesian border, *Der brennende Berg*, Max Burkhardt's *Trinacria*, painting Sicilian life, and towering above them *Die vor den Toren* by Clara Viebig, a remarkably forcible and convincing story of the corruption spreading in the middle class of Berlin when the building boom that followed the victory of Sedan metropolized remote and simple suburbs. Among the psychological novels of the year

Jakob Wassermann's *Die Masken des Erwin Reiners* is an admirable achievement vaguely suggesting the influence of Oscar Wilde; Friedrich Huch's *Enzio* is a striking study of the musical temperament; Norbert Jacques's *Der Hafen*, of a weak and dissolute character; Hermann Bahr's *O Mensch*, of those modern Austrian types so splendidly portrayed in *Die Rahl* and *Drut*; Jakob Schaffner's *Konrad Pilater*, of youth seeking a goal indefinite; and George von Ompteda's *Benigna*, of a woman's life. But the finest work from every point of view is Ernst Heilborn's story of a man at the critical stage when age lurks upon the threshold and youth still asserts its longings and desires: *Die steile Stufe*. Volumes of short stories have been numerous. Noteworthy documents of lives, simple and unsophisticated are the stories by Clara Viebig *Die heilige Einfalt*; of a more complicated character those by Bernardine Schulze-Smidt: *Allerlei Volk*, with their admirable suggestion of local atmosphere. Hugo Salus does not deny his lyric voice in the stories called *Schwache Helden*. Raoul Auernheimer cultivates the clever society satire in his sketches *Gesellschaft*. There have been posthumous volumes by Rudolf Lindau and Otto Julius Bierbaum.

**DRAMA.** The greatest success of the dramatic season in Germany has also been among the greatest in America: Hermann Bahr's comedy, *Das Konzert*. Hermann Sudermann's mediæval drama of the Baltic shores *Strandkinder* which opened to him the sacred portals of the court theatre, failed, however, to satisfy the demands of the critics. Of the young contemporaries of Sudermann and Hauptmann, George Hirschfeld, once the most promising, experiences failure after failure, *Das zweite Leben* being another weak performance. Hugo von Hofmannsthal, who so far has been rather lucky, also failed with his comedy *Christina's Heimreise*. Of the older generation Adolf Wilbrandt's tragedy *Das verschleierte Bild zu Sais* and Ludwig Fulda's play *Herr und Diener* had likewise a cool reception. Heinrich Lilienfeld who a few years ago was one of the most promising newcomers, has gradually conventionalized his individual talent and his *Stier von Oliveira* cannot compare with his earlier work. H. Müller's neo-romanticism, though clad in exquisite language, fails to make an impression when presented on the stage, as *Die Wunder des Beatus* proved. He shares the fate of Adolf Paul, who, though an individuality of quite a different stamp, has also learned that the poetic and romantic qualities of his play, *Blauer Dunst*, were rather a hindrance than an advantage on the stage. It is significant of the attitude of German managers towards new and untried plays that even works so manifestly fit only for reading, as Carl Hauptmann's *Panspiele* should nevertheless be given a hearing; but it is not likely to be repeated. Another author who has a number of *Buchdramen* to his credit, Hans von Gumpenberg, has, however, achieved a success with the one-act comedy *Münchhausen's Antwort*. A unique experiment was the performance of the legendary drama, *Das Weiß des Vollendeten* by the German-writing Dane, Karl Gjellerup. Arthur Schnitzler, physician and dramatist, who has proved himself such a subtle analyst of the souls of men of his time, has turned back a hundred years and given us a most remarkable study of character in the drama *Der junge Medardus*, which he calls a dramatic history

with a prelude, and which presents a picture of Vienna in the Bonaparte year 1809. He has also published a marionette play, *Der tapfere Cassian*. One of the most successful works by a newcomer has been the Russian revolutionary drama *Der Moloch* by Leo G. Birinski. Frank Wedekind continues to send out the curiously grotesque coruscations of his fancy: *In allen Wassern gewaschen*, a tragi-comedy, is as impudent a bit of naturalism as anything that has come from his pen, while *Der Stein der Weisen*, a one-act play in verse, is an admirable satire. There has been no lack of dramas founded upon well-worn themes and challenging comparison with earlier works. An ambitious but commendable first work was Hans Franck's tragedy, *Der Herzog von Reichstadt*. Gustav Renner's *Francesca* is also said to be an acceptable version of the old story. Paul Ernst's *Demetrius* adds to the list of dramas endeavoring to complete the torso of Schiller's pretender-tragedy. Another Schiller-fragment, *Warbeck*, has been skillfully used by Hermann Rottke and well received at its initial performance.

**POETRY.** The poetical production has been somewhat meagre in proportion to that of other years. A work of distinction and genuine poetical qualities is Carl Hauptmann's volume of verse and prose entitled *Aus meinem Tagebuch*, and containing exquisite lyrical mood pictures and stimulating philosophical reflections. Ernst Lissauer, who some years ago made his debut with a volume of verse of pronounced individuality *Der Acker*, has published a revised and enlarged edition of the same book. Gustav Falke, who is classed with the group of rebellious young Germans though he kept aloof from its idiosyncrasies, has sent out a volume of verse called *Die Auswahl*. Carl Busse, who gradually conventionalized his muse until it became almost popular, has published a new volume, *Heilige Not*. It is singular that in this unpoetic age there are poets who manage to publish two volumes within one year, as Christian Morgenstern, the author of *Einkkehr* and *Palmstrom*, or even three as Max Dauthendey, the author of *Weltspuk*, *Schwarze Sonne* and *Die geflügelte Erde*, genuine specimens of his somewhat errant imagination and impressionistic vision. Whoever has admired the lyrical qualities in the fiction of Ernst Zahn was not surprised when he appeared as the author of a volume of verse, *Gedichte*. Of the poets of the older generation Ludwig Fulda has been the only one heard from through his *Melodien*, an enlarged edition of his recent verse. A posthumous volume bearing the name of Heinrich Leuthold is of unusual interest, the poems having been reconstructed from the manuscripts of the neglected author. Lastly there have been two volumes of poems by Frieda Schanz, who is perhaps the most popular, though by no means the most gifted among the women poets of Germany: *Balladen* and *Italienische Pastelle*. The year has been remarkable, however, for the publication of several valuable anthologies. Foremost among them is the dainty volume by Karl Henckell, called *Weltlyrik*, and containing specimens of modern poetry of France, Italy, England, Russia, America, and other countries, in commendable translations by the author, himself a striking poetic personality. A handy and inclusive collection of German poetry is published in two volumes by Willy Vesper and covers eight centuries of German verse. An-

other collection in two volumes is entitled *Die neuere deutsche Lyrik* and is edited by Philipp Witkop. Lastly there has appeared a new and enlarged edition of Maximilian Bern's *Dichtungen vom Brettl und fürs Brettl*, containing perhaps the best collection of poetry suitable for recitation.

**ESSAYS, TRAVEL, HUMOR.** Prose of infinite variety has flooded the book market of the year and among it are some delightful books. Richard Schaukal's *causeries*, *Vom unsichtbaren Königreich*, are distinguished by the same rare and refined qualities as his poems. Theodor Wolff's *Spaziergänge* are in lighter vein, but more brilliant. Emil Reich's *Aus Leben und Dichtung* is a book containing no little philosophy of life and art. Carl Ludwig Schleich is the author of a book entitled *Von der Seele*, which is full of stimulating and illuminating reflections on matters spiritual and æsthetic. Posthumous volumes of aphorisms have come from Ernst von Wildenbruch, *Blätter vom Lebensbaum* and Georg von Oertzen, *Nebensachen*. Paul Friedrich's volume, called *Das dritte Reich* records the tragedy of individualism and Hans W. Fischer's *Der Dreissigjährige* stands entirely apart as an interpretation of life and a sermon on manhood. Among the books of travel Ludwig Brinckmann's volume of American impressions, *Eroberer*, challenges serious attention. Isolde Kurz has sent out a charming volume of Florentine reminiscences, *Florentinische Erinnerungen*, Richard Voss dwells upon his Roman days in *Du mein Italien*, Karl Hans Strobl has written a *Romantische Reise im Orient*, Paul Barcham reflects modern Russia in *Petersburger Nächte*, and Karl Scheffler draws a portrait of Berlin. An entertaining book on hunting is Fritz Skowronnek's *Halali*. A commendable undertaking is that of Roda Roda, the well-known contributor to *Simplizissimus* and Theodor Etzel, called *Welthumor*. Of this collection of the world's best humor the volume called *Das lachende Deutschland* is an excellent specimen and one that augurs well for the volumes to come. Selections from the writings of Otto Ernst have been published under the title *Gesund und frohen Mutes*, and Wilhelm Rullman has undertaken to gather some of the wit and humor of the day, culled from the press and other sources, under the title *Witz und Humor*. A brilliant specimen of Paul Scheerbart's grotesque humor is the story of an invention, *Das Perpetuum mobile*.

**HISTORY, BIOGRAPHY, ETC.** Valuable additions to history are the works by Dr. Albrecht Wirth, *Weltgeschichte*, and Oskar Jäger, *Deutsche Geschichte*. Historical studies are contained in the books by Hermann Oldenburg, *Aus dem alten Indien*, and R. Dagobert Schoenfeld, *An nordischen Königshöfen*. Inclusive studies of the customs and manners of civilized society are the works by Edward Fuchs: *Die galante Zeit* and by Alexander von Gleichen-Russwurm, *Sitten und Gebräuche der europäischen Welt*. Glimpses of biography are contained in Adolf Kohut's book: *Aus dem Herzensarchiv verliefener Berühmtheiten*. Contributions to Goethe biography are Alfred Biese's *Goethe und seine Mutter*, Karl Muthesius's *Goethe und Karl Alexander*, Arthur Rehbein's *Studiosus Goethe in Leipzig und Strassburg*, and others. Schiller biography was increased by George Witkowski's *Aus Schillers Werkstatt* giving an insight into his methods of work. Ibsen literature was en-

riched by Roman Woerner's *Ibsen* and Dr. Wilhelm Hau's *Ibsens Selbstportrait in seinen Dramen*. Wilhelm Fisher-Graz has given us a portrait and Hans Bédard a life of Nietzsche. Kurt Kuechler has stimulated interest in Hebbel by a book on his life and works. August Ehrhard's life of Grillparzer has been translated by Moritz Necker. There has been published a life of Platen by Constantia Ritter and a record of his intellectual development by Dr. Rudolf Schloesser. Arthur Schurig has recorded the story of Wilhelm Heinse's youth, and Dr. Hans Henning is the author of a life of Spielhagen. John Henry Mackay's life of Stirner has gone into a second revised and much enlarged edition.

**LITERATURE, CRITICISM, ETC.** Foremost among numerous works on German literature is the book by Dr. Kuno Francke which has grown out of his *Social Forces in German Literature* published a few years ago; it is entitled *Kulturwerte der deutschen Literatur* and the first volume makes one eager to see how the author is going to work out the central idea in the following. Of Richard M. Meyer's German Literature of the nineteenth century a fourth revised edition has been published; of Adolf Bartels's work on the same subject the eighth edition, and a book by J. Schilling covers the same ground. Karl Weitbrecht has written a history of German letters in the classical period, Dr. Adolf Voigtlin a history of German poetry, and Kurt Martens a useful little handbook on German writers of the present, *Literatur in Deutschland*. The world's literature has been comprehensively treated by Dr. Carl Busse, *Geschichte der Weltliteratur*, and Dr. Otto Hauser, *Weltgeschichte der Literatur*, both in two volumes. Nikolaus Welter is the author of a history of French letters. Otto Hartmann's history of the book-trade *Die Entwicklung der Literatur und des Buchhandels* and Robert F. Arnold's *Allgemeine Buecherkunde zur neueren deutschen Literaturgeschichte* are valuable reference works. Among the numerous psychological and critical studies of contemporaries the book by Maximilian Harden ranks first: *Köpfe*; it contains portraits of the old Emperor William, Empress Frederick, Bismarck and Johanna Bismarck, Eugen Richter, Dr. Stöcker, Gallifet, Holstein, Waldersee, Ibsen, Zola, Matkowsky, Wolter, Mitterwurz, Menzel, Böcklin, and Lenbach. Under the title *Blühender Lorbeer* Otto Ernst talks interestingly about his literary colleagues and compatriots. Eduard Schwarz is the author of a book entitled *Charakterköpfe aus der antiken Literatur* and Max Willaert of Dante Alighieri and seine Zeit. Among the critical contributions to Goethe Literature the most important are the book of Stefan George and Karl Wolfskehl and Wasielewski's *Goethes meteorologische Studien*. Robert Saudeck has added to the literature on Schiller a study entitled *Schiller als Realist*. A. Boehlingk is the author of a book called *Shakespeare und unsere Klassiker*; Dr. Raphael Bazardjian in his *Kritik über das Ibsensche Theater* draws interesting comparisons between Sophocles, Shakespeare and Ibsen. Wilhelm Dibelius has treated English fiction in an inclusive work *Englische Romankunst*; and Julius Bab is the author of a book on George Bernard Shaw. Dr. E. Dühring's book *Die Grössen der modernen Literatur* contains studies of Rousseau, Schiller, Byron and Shelley, and Alexander Eliasberg's *Die grossen Russen* presents the

great Russian writers of the century in well translated specimens of their works. A sympathetic study of Verhaeren is that by Stefan Zweig. *Die neue Form* by Dr. O. E. Lessing is an attempt at interpretation of German naturalism. There have been psychological and critical studies of Frankl, Schubert, Jordan, Heyse, Speidel, Zedlitz, Fouqué, Geibel, Raabe, Wildenbruch, Carl Hauptmann and others.

**MISCELLANEOUS.** Correspondence has figured largely in the book market of the year. Richard M. Meyer has published the collected letters of Goethe and his friends; there have been letters by Schiller, Theodor Storm, Wackenroder, Lenau, Hölderlin, Haller, Iffland, Fontane, Freiligrath and others. Another volume of the conversations of Goethe has appeared, covering the period from the death of Karl August to the year 1828. Dr. M. Schütte has written a book on the Goethe-National-Museum in Weimar; the Goethe-Kalendar begun by Bierbaum has been continued by W. Schüddekopf, and Ludwig Geiger has sent out another volume of his *Goethe-Jahrbuch*. An interesting study is that of Karl Sell on *Die Religion unserer Klassiker*. The relation of the Jews to German literature was treated in a book by Ludwig Geiger. Dr. Franz Strich is the author of a book on the element of mythology in German literature from Klopstock to Wagner. P. M. Huber has written a bulky volume of folklore study, *Die Wanderlegende von den sieben Schläfern*, and Rudolf Buchmann is the author of *Helden und Mächte des romantischen Kunstmärchens*. Among new editions or new volumes in editions previously begun there are 14 of Goethe, several of Schiller, and Kleist, Arndt, Lenz, Heine, Lenau, Büchner and Nietzsche have likewise been reissued. There have been numerous translations of foreign works, among them another volume of Lafcadio Hearn, *Buddha*; works by Dostoyevski, Swinburne, Maeterlinck, d'Annunzio, Tolstoy, Strindberg, Shaw, Wells, Galworthy, Zangwill and others. Among American authors thus honored Jennette Lee's *Uncle William* heads the list; next come *Old Chester Tales* by Margaret Deland and Mrs. Little's *Lady of the Decoration*.

Death has removed a number of prominent writers, among them Otto Julius Bierbaum, Rudolf Lindau, Julius Wolff, Ludwig Hevesi, Hermann Heiberg, Kurt Lasswitz and Gerhard von Amyntor.

**GERMAN METHODIST CHURCH.** See EVANGELICAL ASSOCIATION.

**GERMAN MUSIC.** See MUSIC.

**GERMAN NEW GUINEA, or KAISER WILHELM LAND.** A German protectorate occupying the northeastern portion of the island of New Guinea. Estimated area, about 70,000 square miles; estimated population, about 110,000 natives, whites (1900) 197. There are mission schools. Coconuts, rubber, cabinet woods, copra, mother-of-pearl, and trepang are the chief articles of trade. Imports (1903), 722,538 marks; exports (mostly copra), 281,181 marks; tonnage, 82,381; revenue and expenditure (1909-10), 1,808,835 marks; imperial subvention, 1,065,000. Attached administratively to German New Guinea are the Caroline Islands, the Bismarck Archipelago, the Ladrone Islands, the German Solomon Islands, and the Marshall Islands (qq. v.). The governor (1910, Dr. Hahl) resides at Harbertshöhe in the Bismarck Archi-

pelago. The German-Dutch boundary commission began the work of delimitation in 1910.

It was reported in December that an uprising had taken place in the Caroline Islands owing to discontent with the German road-building policy and that four German officials and five native employes had been murdered at Jokor. Troops were at once sent to the island to restore order.

**GERMAN REFORMED CHURCH.** See REFORMED CHURCH IN THE UNITED STATES (GERMAN).

**GERMAN SAMOA.** A German dependency in the southern Pacific, including Savaii and Upolu (the largest of the Samoan Islands), and several adjacent islets exceedingly fertile and populous. Area of Savaii, about 660 square miles; Upolu, 340. Population (1906), 33,478 (Upolu, Manono, and Apolima, 20,662; Savaii, 12,816), mostly Polynesians. Whites in 1909, 467; Chinese, 1050. Imports (1908), 2,482,406 marks; exports (mostly copra), 2,671,233 marks; tonnage, 117,586; revenue and expenditure (1909-10), 764,000 marks. The governor (1910, Dr. Solf) resides at Apia, in Upolu.

**GERMAN SOLOMON ISLANDS.** The islands of Bougainville and Buka, in the southern Pacific, attached administratively to German New Guinea. Area, about 4500 square miles; population, about 45,000.

**GERMAN SOUTH POLAR EXPEDITION.** See POLAR RESEARCH.

**GERMAN SOUTHWEST AFRICA.** A German protectorate lying south of Angola. Area, about 318,000 square miles; estimated population, about 200,000 (Hottentots, Bushmen, Bantus, and Damaras). Europeans (1909), 11,791. Government schools, 11, with 377 pupils; mission-school pupils, about 3000. There is little agriculture, the chief industry being stock-raising. Livestock, 1909: 96,112 cattle, 300,733 sheep, 4472 angora and 237,551 other goats, 8271 horses, 4636 mules, 5189 asses, 2917 swine, 240 camels. The diamond fields, discovered in 1908 near Lüderitz Bay, continue to yield stones of good size and quality. The first year's production amounted to 561,000 carats, valued at 17,000,000 marks, of which 6,000,000 marks were paid in to the treasury. In 1908, 31,004 tons of copper ore were exported; gold has been found. Imports, including government stores, in 1908, 33,178,994 marks (Germany, 26,933,761); exports, 7,586,427 (Germany, 7,412,160). Exports of copper ore, 6,296,000 marks. Vessels entered (1909), 339, of 1,126,569 tons. Total railways open, 780 miles; under construction, 106. Post-offices, 62. Revenue and expenditure (1909-10), 31,030,000 marks (subvention, 17,125,000). Dr. Seitz was appointed governor in 1910, with headquarters at Windhoek. A revolt broke out among the Kaffirs employed on the railway at Wilhelmstal on October 4, but was suppressed by the aid of troops, 12 natives being killed and 6 wounded.

**GERMAN TARIFF.** See TARIFF and GERMAN.

**GERMANIC PHILOLOGY.** See PHILOLOGY.

**GERMANY.** An empire of Europe extending from France to Russia. Capital, Berlin.

**AREA AND POPULATION.** The area in square miles and the population by states, with density per square mile, are shown in the table below (census of December 1, 1905). *k*=kingdom, *g*=grand-duchy, *d*=duchy, *p*=principality, *f. t.*=free town, *r*=Reichsland.

States	Sq. mi.	Pop.
Prussia ( <i>k</i> )	134,616	37,293,324
Bavaria ( <i>k</i> )	29,292	6,524,372
Württemberg ( <i>k</i> )	7,534	2,302,179
Saxony ( <i>k</i> )	5,789	4,508,601
Baden ( <i>g</i> )	5,823	2,010,728
Mecklenburg-Schwerin ( <i>g</i> )	5,068	625,045
Hesse ( <i>g</i> )	2,966	1,209,175

Reuss Elder Line ( <i>p</i> )	122	70,603
Lübeck ( <i>f. t.</i> )	115	106,857
Hamburg ( <i>f. t.</i> )	160	874,878
Bremen ( <i>f. t.</i> )	99	263,440
Alsace-Lorraine ( <i>r</i> )	5,604	1,814,564
<b>Total</b>	<b>208,780</b>	<b>60,641,278</b>

According to the occupation-census of June 11, 1907, the total population was 61,720,259; census of December 1, 1910, 64,896,881 (subject to revision), showing an increase of about 7 per cent. since 1905, against nearly 8 per cent. from 1900 to 1905. The following table shows the number of persons directly engaged, the number indirectly engaged (including domestic servants), and the total in the given occupations (June 11, 1907):

Occupations	Direct	Indirect	Total
Manufacturing	10,292,976	13,111,400	23,404,376
Agriculture	9,732,472	7,610,463	17,242,935
Commerce, transportation, etc.	3,477,626	4,800,613	8,278,239
Mining	963,278	2,018,883	2,982,161
Professions	1,087,336	1,539,424	2,626,760
Various service exclusive household	471,695	321,058	792,748
Army and navy	651,194	129,172	780,366
Forestry, fishing, etc.	150,785	287,456	438,241
Without occupation	3,404,983	1,769,720	5,174,703
<b>Total</b>	<b>30,232,345</b>	<b>31,488,184</b>	<b>61,720,259</b>

The table below shows the number of marriages (*m*), births, including still-births (*b*), illegitimate births (*i*), deaths, including still-births (*d*), still-births (*s*), emigrants (*e*), and emigrants to the United States (*u*):

	1906	1907	1908	1909
<i>m</i>	498,990	503,964	500,620	.....
<i>b</i>	2,084,739	2,060,973	2,076,660	.....
<i>i</i>	177,060	178,178	184,112	.....
<i>d</i>	1,174,464	1,178,349	1,197,098	.....
<i>s</i>	62,362	61,040	61,608	.....
<i>e</i>	31,074	31,696	19,883	24,921
<i>u</i>	29,226	30,431	17,951	19,920

The larger cities, with population December 1, 1905, are: Berlin, 2,040,148; Hamburg, 802,793; Munich, 538,983; Leipzig, 537,733; Dresden, 516,996; Breslau, 470,904; Cologne, 428,722; Frankfurt-on-the-Main, 334,978; Düsseldorf, 305,163. Reported returns of the census of December 1, 1910, place the population of Berlin at 2,064,153 and of "Greater" Berlin at 3,712,554.

**EDUCATION.** Education is free and compul-

sory, and the number of illiterates is almost negligible. The school age is from six to fourteen years. Elementary schools (1906): Public, 60,584, with 166,597 teachers (29,384 female) and 9,737,262 pupils—expenditure, 522,801,000 marks; private, 614, with 42,094 pupils. Secondary schools (1908): Public, 1405, including 226 normal schools; private, 56. There are ten State-aided technical high schools (of collegiate rank) and a large number of institutions for various special or technical instruction. The German universities have a deserved reputation for excellence, and their growth in recent years has been notable. In 1871 the number of university students was about 13,000; at the end of 1910, including all admitted to lectures, it was about 60,000, while the total of matriculated students was 54,822 (including 2418 women). Number of students in the leading faculties: Philosophy, philology, and history, 15,525; medicine, 11,240; law, 10,890; mathematics and natural science, 7914; theology, Protestant 2535, Catholic 1760; administration, 2544. The University of Berlin had 9686 students; Munich, 6905; Leipzig, 4900; Bonn, 3846; Halle, 2646; Breslau, 2454; Freiburg, 2246; Göttingen, 2233; Strassburg, 2067; Münster, 2047; Heidelberg, 2008; Marburg, 1981; Tübingen, 1883; Jena, 1637; Kiel, 1439; Würzburg, 1425; Königsberg, 1380; Giessen, 1249; Erlangen, 1011; Greifswald, 948; Rostock, 816. The very rapid increase in the number of medical students (from about 6000 in 1908) has caused much comment in Germany, where the profession is overcrowded. Recent statistics show that over one-third of the practising physicians fail to earn \$1000 a year.

**AGRICULTURE.** In 1900, 48.6 per cent. of the total area was under cultivation, 16 per cent. was meadow and pasture, and 26 per cent. forest. In '907, 27.95 per cent. of the population were supported by agriculture, against 34.9 in 1895; corresponding figures for manufacturing are 37.92 and 35.52 respectively; for commerce and transportation, 13.41 and 11.52; for mining, 4.83 and 3.57. A report of the German Imperial Statistical Bureau gives the area and production of specified crops for two years in thousands of acres and thousands of bushels (w. indicates winter; s., spring):

	1000 acres		1000 bushels *	
	1909	1910	1909	1910
Wheat (w.)..	3,944	4,287	117,502	125,981
Wheat (s.)...	581	514	20,498	15,902
Rye (w.).....	14,848	14,997	440,688	408,318
Rye (s.).....	301	290	6,090	5,484
Oats .....	10,650	10,599	628,718	544,287
Barley .....	4,068	3,881	160,552	133,330
Potatoes .....	8,213	8,145	1,716,161	1,597,174
Hay .....	20,377	20,485	† 35,770	† 46,133
Hops .....	72	68	‡ 13,356	‡ 44,998

\* Bushel: 60 pounds wheat, 56 rye, 48 barley, 32 oats.  
† Thousands of tons (2000 pounds). ‡ Thousand pounds.

In 1908-9, 1,077,832 acres were planted to sugar beets; in that year and in 1909-10, the beets worked up amounted to 11,809,182 and 12,904,795 metric tons respectively; raw beet sugar produced, 1,980,387 and 1,940,911; molasses, 275,395 and 271,104. Wine production in 1908 amounted to 3,135,958 hectolitres; in 1909, 2,020,620. Tobacco production in 1906, 32,075,000 kilos; in 1907, 28,839,814; in 1908, 34,419,000. Livestock, Dec. 2, 1907: 4,345,043

horses, 10,991 mules and asses, 20,630,544 cattle, 7,703,710 sheep, 22,146,532 swine, 3,533,970 goats. The number of sheep is declining; in 1871 there were about 25,000,000 in the empire, and in 1910 the estimated number was about 7,000,000. Other livestock show a gradual increase.

**MINERALS AND METALS.** Figures for mineral and metal production include those of the Grand Duchy of Luxemburg. The total value of minerals raised in 1906 was 1,637,000,000 marks; in 1907, 1,845,000,000; in 1908, 1,970,000,000. The following revised figures show the amount in metric tons of the principal minerals raised:

Minerals	1906	1907	1908
Coal .....	137,117,926	142,185,691	147,671,149
Lignite .....	56,419,600	62,546,671	67,615,200
Iron ore .....	26,734,570	27,697,123	24,278,151
Zinc ore .....	704,590	698,425	706,441
Lead ore .....	140,914	147,272	156,861
Copper ore .....	768,523	771,227	727,384
Rock salt .....	1,235,041	1,285,138	1,331,984
Potash salts ..	5,541,667	5,749,368	6,090,439
Other products	483,262	534,298	552,398

The more important reduction products are reported for 1907 and 1908, in metric tons, as follows: Pig iron, 12,875,159 and 11,805,321 respectively; zinc, 208,195 and 216,490; lead, 142,271 and 164,079; copper, 31,946 and 30,001; tin, 5338 and 6375; silver, 387 and 408; sulphuric acid, 1,402,398 and 1,385,740.

**MANUFACTURES.** In recent years German manufacturing industries have shown an enormous development, urban populations have greatly increased, and the condition of agriculture has become unsatisfactory. The cost of living has risen along with the increasing population, the movement from country to city, and the development of capital combination, so that a most narrow margin exists between the income of the factory worker and his actual necessities. And to the burdens of the people due to economic causes is the increasing weight of taxation due largely to the government's aggressive policy in military and naval affairs. Meanwhile, however, the empire has taken a place in the first rank of manufacture and is conspicuous in its output of textiles, iron and steel goods, glass and earthenware, wooden wares, clocks, leather goods, beet sugar, alcohol, and, in fact, almost every kind of factory product. Comprehensive statistics for 1909 and 1910 are not available.

**SHIPPING.** The following table shows the number of German and foreign vessels entered and cleared, with registered tonnage in 1908:

	Entered		Cleared	
	Vessels	1000 tons	Vessels	1000 tons
German ..	83,282	15,771	82,983	15,410
Foreign ..	24,412	11,662	24,457	11,681
Total ..	107,694	27,433	107,440	27,091
	Ent. with cargo		Cl. with cargo	
German ..	74,417	14,570	61,680	11,902
Foreign ..	21,207	10,848	15,224	5,727
Total ..	95,822	25,418	76,904	17,629
	Steamers ent.		Steamers cl.	
German ..	54,414	13,671	53,966	13,414
Foreign ..	15,362	10,783	15,317	10,828
Total ..	67,776	24,454	69,283	24,242

The merchant marine, January 1, 1909, in-

cluded 4638 vessels, of 2,825,404 tons net and 72,450 men; January 1, 1910, 4658 vessels, of 2,859,307 tons and 73,516 men. On the latter date steamers numbered 1950, of 2,349,557 tons and 59,421 men; of the total vessels, those registered at North Sea ports numbered 3719, of 2,556,249 tons and 65,095 men, and at Baltic ports, 939, of 303,058 tons and 8421 men. These figures do not include vessels of a gross capacity of less than 50 cubic metres (that is, 22 metric tons for sail and 15 for steam).

**COMMERCE.** The special trade (imports for consumption and exports of domestic products) is shown in the following table, in thousands of marks:

	1907	1908	1909
Imports:			
Merchandise ....	8,746,678	7,664,021	8,520,125
Precious metals..	256,645	413,072	340,285
Total .....	9,003,323	8,077,093	8,860,410
Exports:			
Merchandise ....	6,850,890	6,398,527	6,592,242
Precious metals..	249,693	82,926	266,451
Total .....	7,100,583	6,481,453	6,858,693

Imports and exports of merchandise, in millions of marks, by great classes—food substances (a), live animals (b), raw materials (c), manufactures (d), totals (e):

	Imports			Exports		
	1907	1908	1909	1907	1908	1909
a	2,217.9	2,042.6	2,324.3	639.9	679.8	662.3
b	226.8	224.6	231.1	11.8	9.5	11.1
c	4,910.4	4,154.2	4,688.9	1,655.4	1,577.2	1,701.9
d	1,391.6	1,242.6	1,275.8	4,638.1	4,182.1	4,216.9
e	8,746.7	7,664.0	8,520.1	6,845.2	6,398.6	6,592.2

The principal articles of merchandise entered for consumption in 1909 were valued, in millions of marks, as follows (figures in parenthesis are for 1908): Cereals, 962 (784.1); cotton, 568 (502.5); hides and skins, 492.5 (392.8); wool, 466.2 (390.5); chemicals and drugs, 287.7 (264.1); coal, 260.2 (271.8); timber, lumber, etc., 252.6 (244.6); copper, 194.8 (198); silk, 193.9 (157.4); coffee, 188.2 (163.6); fruits, 177 (129.8); eggs, 156.6 (137); rubber and gutta-percha, 153 (98.7); iron, 135.9 (142.1); leaf tobacco, 132.1 (125.5); wheaten products, 127.5 (118.5); woolen yarn, 119.7 (97.5); cocoanuts and copra, 116.6 (76.3); animal fats, 111.4 (99); linseed, 105.7 (101.2); oil-cake, 98.3 (85.9); butter, 96.5 (72.7); fish, 95.5 (85.9); cotton yarn, 89.5 (87.8); flax and hemp, 78.1 (76); silk goods, 69.5 (64.5); petroleum, 65.7 (75.3); iron manufactures, 64.6 (65.2); machinery, 63.5 (68.5); furs, etc., 63.3; rice, 59.2; cotton goods, 53.5; jute, 51.6; wine, 47.3.

Values, in millions of marks, of 1909 domestic exports (1908 figures in parenthesis); iron manufactures, excepting machinery, 694.9 (704.3); coal, 413 (398.9); machinery, 384.4 (415.9); chemicals and drugs, 380.9 (331.7); cotton goods, 321.7 (350.2); cereals, 255.9 (224.2); woolen goods, 255.5 (258.7); dyes and colors, 231.2 (208.7); sugar, 207.3 (195.7); paper, 200.3 (184.3); electrical apparatus, etc., 180.9 (177.3); leather, 172.4 (165.1); silk goods, 164.1 (167); furs, etc., 142.1 (114.1); hides and skins, 136.3 (111.2); ships, 117.6 (97.8); copper manufactures, 114.6 (102.5); wool, 111.1 (94.8); woolen yarn, 109.7 (66.1);

glass and glassware, 90 (104.1); apparel, 87.7; pottery, 76.1 (174.8); toys, 76.1 (66.8); leather manufactures, 74.3 (77.4); gold and silver manufactures, 70.7 (107); cotton, 70.3 (56.5); books, maps, etc., 61.8 (61.8); musical instruments, 56.3 (56.6).

In 1908 and 1909 the special commerce (exclusive of precious metals) with the principal countries of origin and destination was valued, in millions of marks, as follows:

	Imports		Exports	
	1908	1909	1908	1909

**COMMUNICATIONS.** Most of the German railways are owned or operated by the states (in Alsace-Lorraine by the Imperial government). The lines in operation under government ownership or management and the total private lines were as follows on August 1, 1909 (normal gauge, narrow gauge, and totals, in kilometres—one kilometre = .62137 mile):

	Norm. g.	Nar. g.	Total
Owned or operated by			
Prussia and Hesse.....	37,044	242	37,286
Bavaria .....	7,653	109	7,762

Total miles .....	36,373	1,297	37,670

In 1904 Germany had over 8500 miles of inland navigable waterways. The telegraph is owned and operated by the state; in 1909, 43,680 offices, with 217,958 kilometres of line and 638,465 of wire. Post-offices (1909), 40,769.

**FINANCE.** The unit of value is the mark,

worth 23.8 cents. The budget for the year ending Mar. 31, 1911 (as voted Mar. 21 and May 22, 1910) balanced at 2,853,781,095 marks (including extraordinary revenue and expenditure balancing at 190,730,269 marks). The larger items of estimated ordinary revenue were: Customs, excise, stamps, etc., 1,441,620,000 marks (customs 631,900,000, spirits excise 180,000,000, sugar 147,000,000); posts and telegraphs, 693,226,325; railways, 122,319,000; matricular contributions of the several states, 228,512,000 (Prussia 141,831,687). Of the extraordinary receipts, loans accounted for 148,149,162 marks. As voted, the larger expenditures, including ordinary (permanent and transitory) and extraordinary, were: War, 806,740,757 (exclusive of 1,239,941 marks for the High Court of Military Justice); posts and telegraphs, 665,275,077; navy, 442,176,342; Imperial treasury, 252,584,473; Imperial debts, 224,976,223; pensions, 118,352,641; railways, 113,709,981; interior, 107,373,493.

At the end of 1908, the interest-bearing debt of the empire was 4,253,500,000 marks, having increased by 250,000,000 marks during the year. Non-interest-bearing debt: Treasury bonds, 593,000,000 marks, having increased by 119,000,000 during the year; paper money, 120,000,000. Total debt, Dec. 31, 1908, 4,968,500,000 marks, against 4,597,500,000 Dec. 31, 1907. The invested fund for invalids amounted to 91,010,119 marks Mar. 31, 1910. There is a war treasure fund of 120,000,000 marks preserved in gold at Spandau. The Imperial coinage (less amounts withdrawn) from 1871 to Mar. 31, 1909, amounted to 5,530,188,200 marks (gold 4,465,324,400, silver 955,263,500).

**ARMY.** Military service is compulsory in Germany and every citizen called upon to bear arms at 18 years of age is liable to serve for 7 years in the regular army, 2 years of which for the infantry and 5 years for the horse artillery and cavalry are spent in the ranks with the colors and the remainder of the period with the army reserve. Then follows 5 years (3 years for cavalry and horse artillery) with the first levy of the Landwehr, which involves two trainings of 14 days each for the dismounted branches only. After this comes service with the second levy or ban until the soldier's 40th year without training periods and finally service with the Landsturm or Home Defence Army, second ban, until the 45th year is completed. The surplus of recruits over those required for the regular army pass into the Ersatz Reserve, where they receive a limited amount of training before passing to the Landsturm, or they may be enrolled at once in the first ban of the Landsturm, in which are all able bodied men from 17 to 39 who have not served otherwise. In addition there are One Year Volunteers who pay all their expenses and after training become eligible to act as officers in the Reserve and Landwehr. In 1910 there were about 12,000 enrolled. In 1910 the German Army was organized in 23 corps in which were included a corps of guards and 3 Bavarian Corps. There were 630 battalions of infantry and chasseurs, 74 machine gun sections serving with the infantry (the 13th company of a regiment) and 16 with the cavalry, 498 squadrons of cavalry, 574 field batteries, 165 fortress batteries, 165 companies of foot artillery, 153 companies of engineers, 68 squadrons of train and various railway, balloon, and other technical troops. This army on October 1, 1910,

amounted to 25,722 officers, 85,259 non-commissioned officers, and 504,446 men, and 7082 medical, veterinary, pay and other officers and men. There were 114,162 horses.

To form a Field Army for war service the regular establishment would be increased by the reserve divisions, one for each of the 23 army corps, 11 cavalry divisions and other troops so that there would be a grand total of 962 battalions of infantry, 485 squadrons of cavalry, 828 batteries of artillery, 16 machine gun sections, and 95 companies of pioneers, giving a total strength of about 984,000 infantry, 72,000 cavalry, 4968 guns, and 96 machine guns, or a total of about 1,165,000. When to the Field Army and its reserve formation are added the Landwehr amounting to 1,800,000, and the 30,000 of the Ersatz Reserve, was estimated that the total war strength of the German Empire could be stated at about 4,330,000 men.

The five-year period through which the German active army had been annually increased by the Army Law of April 1, 1905, expired on March 31, 1910. A new quinquennium was to begin in 1911 and it was believed that there would be continued expansion of the army. The budget of 1910 showed a total of 1,010,589,848 francs for military purposes or a decrease of 59,779,138 francs from the figures for 1909. This was divided as follows: Ordinary budget: recurrent expenses, 883,507,058 francs, non-recurrent expenses, 97,408,447 francs: extraordinary budget, 28,233,775 francs; military justice, 1,550,468 francs. Two new cavalry regiments were provided for and also two staffs of cavalry brigades. Other provisions made were for increasing the available number of horses for the field artillery and the increase of the number of officers, especially those charged with the command of reserve organizations upon mobilization. A new veterinary corps was also created.

**NAVY.** The number and displacement of warships, built and building, of 1000 or more tons, and of torpedo craft of more than 50 tons, were as follows in 1910: Battleships of 10,000 tons and over (counting 2 of 9874 tons each), 35, aggregating about 534,000 tons; armored cruisers, 13, of about 182,000 tons; coast-defense vessels, 6, of 24,308 tons; cruisers 6000 to 3000 tons, 29, of 124,030 tons; cruisers 3000 to 1000 tons, 16, of 36,077 tons; torpedo-boat destroyers, 109, of 57,262 tons; torpedo boats, 27, of 4719 tons; submarines, 20, of 7680 tons; total, 255 vessels, of about 970,000 tons. These figures do not include, besides the small craft as noted above, vessels over twenty years old (unless reconstructed and rearmed since 1900), those not actually begun although authorized, or transports, colliers, converted merchant vessels, etc. In 1910, the battleships included 2 second-class (completed in 1893), of 9874 tons each; 5 second-class (completed between 1898 and 1901), of 10,974 tons each; 5 first-class (completed in 1902 and 1903), of 11,643 tons each; 5 first-class (completed between 1904 and 1906), of 12,997 tons each; and the following first-class: *Deutschland* (1906), 13,200 tons; *Hannover* (1907) and *Pommern* (1907), 13,200 tons each; *Schleswig-Holstein* (1908) and *Schlesien* (1908), 13,200 tons each; *Nassau* and *Westfalen* (each completed 1909 and joined the fleet May 3, 1910), 18,200 tons each; *Posen* and *Rheinland* (both joined the fleet Sept. 20, 1910),

18,200 tons each. The last four vessels have each a main armament of twelve 11-inch and twelve 5.9-inch guns and a speed of 20 knots. Armored cruisers in 1910: One (1900), 10,700 tons; one (1902), 8868 tons; 2 (1903 and 1904), 9000 tons each; 2 (1905), 9500 tons each; 2 (1907), *Gneisenau* and *Scharnhorst*, each 11,600 tons, with a main armament of eight 8.2-inch and six 5.9-inch guns and a speed of 22.5 knots; one (1909), *Blücher*, 16,000 tons, twelve 8.2-inch and sixteen 6-inch guns, and 23 knots speed; one (1910), *Von der Tann*, 19,300 tons, eight 11-inch and ten 6-inch guns, and 26 knots speed. In 1910 there were building nine 22,000-ton first-class battleships, to have a speed of twenty knots and probably twelve 12-inch guns each. These battleships are known as *Ostfriesland* (*Ersatz Oldenburg*), *Helgoland* (*Ersatz Siegfried*), *Thuringen* (*Ersatz Beowulf*), *Oldenburg* (*Ersatz Frithjof*), *Ersatz Hildebrand*, *Ersatz Heindall*, *Ersatz Ägir*, *Ersatz Hagen*, and *Ersatz Odin*; the first three were launched in 1909 and the fourth June 30, 1910. Four armored cruisers were under construction in 1910; of these, the *Von der Tann* was launched April 7; the latter and also "H" and "I" are of 22,600 tons displacement, with eight 12-inch and twelve 6-inch guns and a speed of 26 knots. Three small protected cruisers, 8 submarines, and 24 destroyers were completed in 1910; but of the latter 4 were sold in February to the Turkish government. Also in 1910 several small cruisers and torpedo craft were building but not completed. The personnel of the navy in 1910-11 is over 57,000 officers and men. German naval expenditures, which show a continuous annual increase, nearly trebled from 1900-1 to 1909-10; for the latter year the total voted was 442,176,342 marks (\$105,237,969). See NAVAL PROGRESS.

**GOVERNMENT.** The executive authority is vested in the King of Prussia under the title of German Emperor. The Emperor in 1910 was William II; he was born January 27, 1859, married Augusta Victoria, Princess of Schleswig-Holstein, February 27, 1881, and succeeded to the throne June 15, 1888. The heir-apparent is Prince Frederick William, who was born May 6, 1882, and married Cecilie, Duchess of Mecklenburg, June 6, 1905. The Imperial ministers do not form a single body (cabinet), but manage their departments independently of one another; they act under the general supervision of the Imperial Chancellor, who is appointed by the Emperor without reference to the political majority of the legislative body and is directly responsible to him. The legislature consists of an upper house, or Bundesrath, presided over by the Chancellor, and a lower house, or Reichstag. Members of the former (58) are chosen by the governments of the several states, and those of the latter (397) are elected by popular vote. The Imperial Chancellor in 1910 was Theobald von Bethmann-Hollweg (from July, 1909). The Imperial ministers, or secretaries of state, were: Foreign Affairs, Alfred von Kiderlen-Waechter; Interior, Klemens Delbrück; Navy, Admiral Alfred von Tirpitz; Justice, Hermann Lisao; Treasury, Adolf Wermuth; Posts and Telegraphs, Reinhold Kraetke; Colonies, Friedrich von Lindequist. The several federated states have their own governments. Alsace-Lorraine has been governed directly by the Imperial authorities, but in December, 1910, a con-

stitution for the Reichsland, providing a certain measure of representative government, was drafted by the Bundesrath (see below, paragraphs on History). The several state executives in 1910 were: ALSACE-LORRRAINE, Statthalter Count von Wedel (appointed October 18, 1907); ANHALT, Duke Friedrich (succeeded January 24, 1904); BADEN, Grand-Duke Friedrich II (September 28, 1907); BAVARIA, Prince Luitpold, appointed regent June, 1886, for King Otto Wilhelm Luitpold (June, 1886); BREMEN, Burgomasters Barkhausen and Pauli; BRUNSWICK, Regent Johann Albrecht, Duke of Mecklenburg (elected May 28, 1907); HAMBURG, Burgomaster M. Predöhl; HESSE, Grand-Duke Ernst Ludwig (March 13, 1892); LIPPE, Prince Leopold IV (October 25, 1905); LÜBECK, Burgomaster J. G. Eschenburg; MECKLENBURG-SCHWERIN, Grand-Duke Friedrich Franz IV (April 10, 1897); MECKLENBURG-STRELITZ, Grand-Duke Adolf Friedrich (May 30, 1904); OLDENBURG, Grand-Duke Friedrich August (June 13, 1900); PRUSSIA, King Wilhelm II (June 15, 1888); REUSS ELDER LINE, Prince Heinrich XXVII, hereditary prince of Reuss Younger Line, regent (from October, 1908) for Prince Heinrich XXIV. (April 19, 1902); REUSS YOUNGER LINE, Prince Heinrich XXVII, hereditary prince, regent (since 1892) for Prince Heinrich XIV (July 11, 1867); SAXE-ALTENBURG, Duke Ernst (February 7, 1908); SAXE-COBURG-GOTHA, Duke Charles Edward (July 30, 1900); SAXE-MEININGEN, Duke George II (September 20, 1866); SAXE-WEIMAR, Grand-Duke Wilhelm Ernst (January 5, 1901); SAXONY, King Friedrich August III (October 15, 1904); SCHAUMBURG-LIPPE, Prince Georg (May 8, 1893); SCHWARZBURG-RUDOLSTADT, Prince Günther (January 19, 1890); SCHWARZBURG-SONDERSHAUSEN, Prince Günther of Schwarzburg-Rudolstadt since death of Prince Karl Günther (March 28, 1909); WALDECK, Prince Friedrich (May 12, 1893); WÜRTTEMBERG, King Wilhelm II (October 6, 1891).

## HISTORY

**PRUSSIAN ELECTORAL REFORM.** Prince von Bülow, while still hoping to maintain the *bloc*, had promised that the government would bring in a Prussian suffrage reform measure. This concession to the Liberal interests became the unwelcome duty of the new Chancellor, von Bethmann-Hollweg, and on February 4, 1910, an electoral reform project prepared wholly under bureaucratic direction was presented to the Landtag. It made no concessions whatever to the Liberal demands, and in order to secure even a basis for discussion the government was obliged to consent to changes which were offensive to its own partisans. It retained the most objectionable features of the existing law, namely, the three-class system and public voting. It substituted, however, direct for indirect voting and it admitted officials and educated persons into the first and second classes without regard to the amount of taxes paid by them. In his speech on behalf of the measure the Chancellor declared definitely that the government had set its face against a suffrage based on democratic principles. The Conservative interests were of course opposed to any measure of real reform. The three-class system of voting was wholly satisfactory to them and they were far from agreeing with Bismarck's often-quoted

opinion that the Prussian electoral system was the worst of all. In order to keep the promise to which von Bülow had committed the government they were willing that something should be done, but wished to reduce it to a minimum. Even a slight measure of reform would, in their opinion, form the opening wedge for radical changes. When the measure came before the Upper House an amendment was offered by Baron von Schorlemer, with the approval of the government, providing for the three-class division of primary electors according to entire districts instead of small electoral subdivisions as heretofore. This was offered as the price of National Liberal support. The Clerical party had already declared that it would not accept a project which met the wishes of the National Liberals, and it was evident that such an amendment would cause the defeat of the measure. The purpose of the government in submitting it was not clear and there was a general suspicion that it did so with the desire to court failure. It passed the Upper House on April 29, but during the discussion in the Lower House the measure was cut to pieces to such a degree that it lost all meaning and consistency and the government withdrew the project (May 27). While the unsatisfactory franchise measure was pending, hostile demonstrations organized by Socialists occurred throughout Prussia and elsewhere, and there were more or less serious disturbances at Berlin, Frankfurt, Halle, Duisburg, Königsberg and Kiel, accompanied by some bloodshed. It was charged, on the one hand, that the Social Democrats were causing the riots, and on the other, that the police were needlessly aggressive. The Socialists arranged a great franchise demonstration in Berlin for Sunday, March 6, and though forbidden by the police to march they succeeded in turning out in very large numbers. The police seem to have been needlessly severe on this occasion, charging the crowd and wounding many persons. Many arrests were made. On the anniversary of the revolution of 1848 further riots occurred.

**MINISTERIAL CHANGES AND PARTY POLITICS.** In the summer, several unexpected and important changes were made in the Ministry. Herr Dernburg, Secretary of State for the Colonies, was succeeded by von Lindequist, the Under-Secretary, and Baron von Schoen, Foreign Minister, by von Kiderlen-Waechter, the German Minister at Bucharest; in Prussia Von Moltke, Minister of the Interior, by von Dallwitz, President of Upper Silesia; von Arnim, Minister of Agriculture, by von Schorlemer, President of the Rhine Province; and Baron von Rheinbaben, Finance Minister, by Herr Lentze, Burgo-master of Magdeburg. These changes were regarded in political circles as indicating the desire of the new Chancellor to solidify the Right against the Democratic elements. Von Moltke had been a defender of the reform measure, whereas his successor, von Dallwitz, represented the extreme Conservative element. The former's dismissal, as well as that of von Arnim, was quite unexpected. Herr Dernburg's resignation arose from his intimate association with the former policy of the *bloc* under von Bülow and his unwillingness to adapt himself to the new political conditions. It was hastened by the attacks upon him by the Centre in connection with the bill for paying the cost of suppressing the risings in German Southwest Africa. His

successor, being versed in the traditions of his office, was thought likely to carry on his policy. Herr Dernburg, who had held office since 1906, had striven to introduce a new commercial spirit into the colonial administration and had displayed marked ability. His record had been of great aid to the government in the elections of 1907. The dismissal of Baron von Schoen was attributed in part to his desire to be relieved of the burdens of his office and especially to obtain the post of Ambassador at Paris, but it was hastened by the attacks upon him of the "jingo" element, especially the Pan-Germans, who found him too pacific in his Moroccan policy in general, and were opposed to his attitude to the Mannesmann affair in particular. He succeeded Prince Radolin at Paris. The most significant of these cabinet changes was the removal of von Rheinbaben, who had been for ten years an active member of the Ministry. He enjoyed the confidence of the Agrarian element and was regarded in general as the rival of von Bethmann-Hollweg. His dismissal was accordingly taken as marking the triumph of the latter. Von Rheinbaben's successor, Lentze, was in full sympathy with him, and in fact had a short time before defended the Prussian government's financial policy against violent criticism from the Director of the Deutsche Bank; but politically, Lentze represented the National Liberals, or rather their Right Wing, so his appointment was regarded as a bid for National Liberal support. Baron von Schorlemer's appointment also was regarded as an overture to the National Liberals. He had been the author of the suffrage amendment above mentioned, which the National Liberals had required as a condition precedent to their support of any government reform project, and he had also, as President of the Rhine Province, sustained friendly relations with that party which is dominant in the great industrial centres of the province. On the other hand, he had in some degree the confidence of the conservative element of the Centre.

Thus the appointments of the Chancellor were taken as a sign of a new alignment by which a *bloc* might be formed, consisting of Conservatives, Independent Conservatives, the Centre, exclusive of its more democratic elements, and the Right of the National Liberal party. At the same time a similar tendency toward concentration appeared among the groups of the Left. For some time past thoughtful members of the Radical party had come to the conclusion that there was but one means of putting an end to the reactionary tendency in Germany and Prussia, and that was to form a *bloc* out of the parties of the Left, regardless of their differences of opinion. The bitter rivalry between the Liberals and Socialists offered, of course, a serious obstacle to any such scheme. But efforts to bring about a conciliation between the democratic members of the Liberal party and the Revisionist Wing of the Socialist party had been in progress for some time. This policy had achieved important practical results in the Baden Landtag, where the Clerical-Conservative coalition became so menacing that a union between the Liberals and Socialists was actually formed. In the last election this fusion of the parties of the Left prevented the triumph of the Clerical-Conservative alliances, and although many supposed that after the elections the parties of the Left would soon fall apart, the co-

alition continued and controlled the action of Parliament in some important particulars. Its chief success was the voting of a new school law, which represented a democratic advance. The question of voting the budget involved a point of great importance in Socialist policy. The last Socialist Congress at Nuremberg had declared vigorously against voting the budget and had refused to recognize that the Liberal party was in any way to be distinguished from the other political parties which, being opposed to Socialism, were regarded as altogether reactionary. The Baden Socialists, as a result of the political situation, voted the budget in spite of this decision of the Nuremberg Congress. The result was a serious division of opinion among the German Socialists. The difficult question was left for the next Congress, which was to meet in Magdeburg in September. The Socialist party, since the failure of the financial reform measure of 1909, had made important gains in the complementary elections to the Reichstag. Six new seats were won by them and the popular vote showed a remarkable increase. Discontent with the government's policy drove many into the ranks of the Social Democrats. See SOCIALISM, paragraph on *Germany*.

**PARLIAMENT.** The animosities between the various political groups, and the uncertainty as to the government's intentions and as to the political situation generally, blocked the work of legislation not only in the Reichstag, but in the Prussian Landtag. Several important measures were before the Reichstag, including the bill concerning penal procedure, the increment tax bill and the potash bill. Of these the only one that was passed before the adjournment of Parliament in May for the summer recess was the potash measure. This created a trust of all the potash mines in the country. For some time past, the potash industry had been in serious difficulties, owing to the setting up of new factories and consequent overproduction. The new law provided that potash should be sold to foreigners only through the actual proprietors, that is to say, those who mined potash on their own account, and it limited the amount that should be sold each year, the Federal Council to control the distribution of the output of the respective establishments until December 31, 1910. The law also fixed the minimum price for the domestic market. The incident illustrated the great divergence between the German government's policy toward trusts, and that pursued by other countries, especially the United States. (See FERTILIZERS). The increment tax bill was in effect a supplement to the measure of fiscal reform passed in 1909. It was adopted by the Bundesrath in April and presented to the Reichstag. The principle upon which it readjusted the rival claims between the local and Imperial authorities was that the taxation be divided into three parts, 50 per cent. for the Imperial treasury, 40 per cent. for the local authorities and 10 per cent. for the cost of collection.

**NAVAL AFFAIRS.** When the naval budget was presented it was found to show an increase of \$7,000,000. In the course of the debate on the estimate in March a Socialist speaker pronounced the navy a cause of alarm to Great Britain and a menace to the peace. The Chancellor replied that the navy building programme was in no wise aggressive, but due to the need

of effective sea power for the protection of the coasts; that there was nothing secret about it and that the relations with Great Britain were open to everybody. Germany was aiming merely to secure her further development and there was no reason why her friendly relations with any other Power should be disturbed. Work on the new naval base at Brunsbüttel at the western terminus of the Kaiser Wilhelm Canal began early in the year, plans for it having been completed in February. It was believed that the new base would be of equal importance to that of Kiel. The plan was said to include a considerable enlargement of the canal. German naval progress was watched uneasily in Great Britain, and every accession was reported in the British press and commented upon. By April, all of the seventeen large vessels concerning which there had been so much discussion had been begun. The eighth German *Dreadnought* was launched at Dantzig, in July. On November 28, soon after the meeting of the new Parliament, the naval estimates were presented to the Reichstag. They showed an unprecedented amount.

**CRITICISM OF THE VATICAN.** Notes passed between Germany and the Vatican on account of a passage in the new Encyclical of Pius X. contrasting the work of Saint Carlo Borromeo with that of the Protestant reformers. The latter were characterized as seducers, who exhausted the strength of Europe in war and strife, and prepared the way for the decadence of modern times, and under the name of evangelical freedom caused a corruption of morals and the perversion of discipline. This criticism of the Reformation caused much excitement in evangelical circles in Prussia and the government protested in a note, pointing to the fact that the criticism did not deal with dogma alone, but related to morals as well. The reply of the Curia was to the effect that the purpose of the Encyclical had not been rightly understood, and that the Pope regretted the excitement that followed its publication. It went on to declare the genuine respect and sympathy of the Vatican for the German nation.

**THE MOABIT AFFAIR.** A comparatively slight disturbance in a coal yard in the Moabit district of Berlin led to street riots, which were magnified in certain quarters and minimized in others according to the political opinions of those interested. They became the subject of a discussion, in the closing months of the year, which seemed disproportionate to the importance of the affair itself. A firm of coal dealers in the Moabit district, whose workmen had gone out on strike, employed a number of strike-breakers. This angered the strikers and their sympathizers and it was necessary for the police to protect the new employees. On the night of September 26, crowds gathered, threw stones and caused some damage. The police tried to protect the property, but were attacked by the rowdy element and some forty of them were injured. There were further disturbances on the night of September 27, the mob including, besides the ordinary rowdies, many women and children. The Socialist papers contended that the strikers themselves had not taken any part in the outbreak. Many windows and street lamps were broken, and there were some further collisions with the police. Late on the night of September 28 four correspondents of British

and American newspapers were attacked in the street by the police and later lodged a complaint against them. Some 273 persons were said to have been injured in the riots on that evening. There were no further disturbances and the police were withdrawn on September 30. There was much comment on the incident in the German press, which seemed nonplussed by the sudden outbreak of disorder in the strictly regulated, well-disciplined city of Berlin. The American and British governments protested against the maltreatment of the newspaper correspondents and the Chancellor expressed regret, declaring that the incident was under investigation by the Minister of the Interior. Many arrests were made and the trial of the accused took place in December. Critics of the government blamed it for the severity of the sentences which it imposed on some of the alleged rioters, and in general for making too much of the affair.

**CRITICISM OF THE KAISER.** In the summer of 1910 the Kaiser made a speech at Königsberg in which, after reminding his hearers that his grandfather believed himself the chosen instrument of Heaven, and in possession of the crown by God's grace alone, he concluded with the following words, which gave the impression that he himself was of the same opinion: "Considering myself as the instrument of the Master, regardless of passing views and opinions, I go my way, which is solely devoted to the prosperity and peaceful development of the Fatherland." These words were immediately seized upon by the press as proof of the intention to govern without regard to public opinion, and were widely and sharply criticised. After the reassembling of the Reichstag in the last week of November, the Social Democrats, through their leader, Herr Ledebour, demanded an explanation of the Kaiser's speech, which was declared to be in violation of the promise that he had made after his indiscreet interview of November, 1908. Herr Ledebour accused the Kaiser of distorting history in his picture of the Hohenzollerns as ruling by divine right. Far from gaining the Prussian throne by the grace of God alone, the Elector of Brandenburg had, he declared, obtained it "from the Holy Roman Empire by begging and whining and all manner of intrigue at the court of Vienna." "The Kaiser," the speaker said, "should not attempt to rule against the opinion of the people; if he does, his position becomes untenable." He asked the Chancellor whether this new speech of the Kaiser's was consistent with his promise to observe all proper reserve in public discourse after the indiscretion of 1908. The Chancellor replied that the Socialist interpellation was plainly inspired by "passionate hostility to the constitution." The Socialists, as a party, were Republicans, and although this fact had long been known, it was now, as a result of Herr Ledebour's speech, more openly and emphatically shown than ever before. Popular sovereignty was not a principle of the Prussian state. The Königsberg speech in no wise violated His Majesty's promise of 1908, for it was clearly the Kaiser's right to use the expression "by the grace of God." "The Kings in their relation to the people are Kings in their own right. It must not be wondered at that in our day, when democratic tendency appears to treat the King as the official of the people, the King of Prussia strongly emphasized his consciousness that he is not subject to popular sovereignty."

**THE NEW SESSION.** The Reichstag reopened after the summer and autumn vacation, with unfavorable prospects for the government. At the time of adjournment, six months before, there had been only 43 Social Democrats in that body; now there were 52. The Chancellor's course in the matter of the Prussian franchise was regarded as among the chief causes of popular hostility. There was also much discontent with the high prices of meat, which gave rise to a general demand for throwing open the country to the importation of foreign meat. One of the first acts of the Ministry after the opening of the session was to refuse this demand, using the often-repeated arguments that German cattle must not be exposed to the danger of infection from the importation of foreign cattle, or the public health menaced by the sale of American meat in the German market. There were no very important measures promised, the chief business of the House being to determine the army's strength for the next five years.

**COMMERCIAL RELATIONS WITH THE UNITED STATES.** Negotiations with Germany were begun by the United States government after the passage of the Aldrich-Payne tariff bill in August, 1909, for a new commercial agreement to take the place of the arrangement under the Dingley act, which was to expire on February 7, 1910. Unless a new arrangement were made, the full German tariff rates would apply to all United States imports, and the maximum rates under the Aldrich-Payne act would, after April 1, 1910, apply to German imports into the United States. One of the demands of the American government was for the relaxing of certain severe restrictions imposed by Germany upon the import of American cattle. The German government, however, maintained that these were necessary for sanitary reasons. The danger of a tariff war with the United States was finally removed by an agreement early in February, whereby the two countries were to trade with each other on a basis of the minimum rates. The strict regulations as regards American cattle, which were supposed to be due to the influence of the Agrarian party, were not relaxed, but by the terms of agreement the question was set aside for future consideration.

**OTHER EVENTS.** It was announced by the Imperial Finance Minister in March that the deficit was \$44,500,000. As to the returns from the new taxes, they could not at present be estimated and it might not be possible to determine their amount until 1912. A contest arose with the Poles in February on account of the dismissal by the government of Polish petty officials who had voted for Polish candidates. The Poles protested against this course, but the Chancellor replied that every one must uphold Prussia's Polish policy. In the middle of April a serious lockout occurred in the building trade, throwing a very large number of men out of employment, but an agreement was reached early in June. A serious shipbuilding strike was carried on in August and September, and by October 1 had reached dangerous dimensions, some 22,000 men being out of employment. The Association of Employers decided to lock out 60 per cent. of their men unless the strike terminated, and in some cities they gave the strikers a week's notice to return to their work. Soon afterwards, however, a compromise was reached. The men, who had demanded a reduction of from

three to four hours a week and a 10 per cent. increase in wages, received a reduction of one hour a week and an increase of about 4 or 5 per cent. in wages. On March 30, a disastrous railway accident occurred at Mülheim-on-the-Rhine, in which 21 soldiers were killed and 130 seriously injured. Floods in the River Ahr caused serious loss of life and damage to property. Floods also occurred at Oberammergau. Early in July it was announced by the Imperial authorities that they had come to a complete agreement in regard to the constitution of Alsace-Lorraine. The provisions of the proposed constitution had not been made public at the close of the year, but it was reported that while granting a considerable measure of autonomy they did not make Alsace-Lorraine a constituent state of the empire, but left it in the status of a province, and that its government was to be constituted as follows: Two chambers, the lower to be filled by universal suffrage with plural voting for the older citizens, the upper partly by special qualification and partly by nomination; the province to have a voice in the Federal Council, but not a vote; the Emperor to nominate one-half the members of the upper house by advice of the Federal Council, and to appoint the governor, subject to the approval of the President of the Federal Council, that is the Chancellor. In the by-elections the Socialists continued to gain, and after the by-election of July 30, in Württemberg, in which the Socialist candidate won, the number of Socialists in the Reichstag was 50. The centenary of Berlin University was celebrated on October 10, with the Emperor and other members of the royal family in attendance. The King and Queen of Belgium visited Potsdam and Berlin at the end of May. The Emperor William visited the Emperor Francis Joseph at Vienna on September 20; visited the King and Queen of Belgium on October 25, and met the Czar at Potsdam on November 4. The arrest of two English officers on the charge of spying into the defenses of Borkum caused much comment in the British press. The trial was held at Leipzig, and on December 21 the officers were found guilty and sentenced to four years' detention in the fortress. The severity of this sentence caused the English press to remark on the contrast to the leniency shown in a nearly parallel case in Great Britain, a German officer having been tried for spying into the British defenses, and dismissed by the British court with a slight punishment.

**GIBBON, LARDNER.** A former officer of the United States navy, died January 9, 1910. He was born in Philadelphia in 1829 and was appointed a midshipman in the navy. He became a lieutenant in 1851. In the early fifties he conducted an expedition from the coast of Peru across the Andes and down the Madeira and Amazon rivers, traveling about 2000 miles in a canoe. A book describing this expedition was published by the government. He was the first to suggest the building of a railway around the falls of the Madeira River for the opening of a highway from Bolivia to the Atlantic coast. Such a railway is now in course of construction by the government of Brazil. In 1857 Gibbon resigned his commission in the navy and during the Civil War was in the service of the Confederacy.

**GIBRALTAR.** A British crown colony and naval station on the southern coast of Spain.

Area, 1½ square miles; greatest elevation, 1439 feet; population, estimated 1908, 23,443 (civil, 18,316; actual military, 5127). Average births, 27.55, average deaths, 18.7, per 1000 of the fixed civil population. There are private and government schools, with 2474 pupils in 1908-9; government grant, £1938. Roman Catholics predominate. There are practically no industries. The port is free and is the mart of a considerable trade between Great Britain and northern Africa. It is also a great coaling station, and the principal base of the Atlantic fleet. A deep harbor of 260 acres accommodates the largest vessels, and 50 acres have been reclaimed in addition for the new dockyard. Length of new docks, 850 feet (double), 550, and 450. Total tonnage entered (1908), 4,586,142 (British, 2,853,700). There are four miles of internal telegraph besides external cable communications. Revenue and expenditure (1908), £82,524 and £79,523 respectively. Governor and commander-in-chief, General Sir A. Hunter, in place of General Sir F. W. E. Forestier-Walker, who died Aug. 31, 1910.

**GIFFEN, Sir ROBERT.** A journalist, financier, writer and statistician, died April 10, 1910. He was born at Strathaven, Lanarkshire, Scotland, in 1837 and was educated in the schools of his native town and at Glasgow University. He began newspaper work as a reporter on the staff of the *Stirling Journal* in 1860. In 1862 he obtained a position on the *London Globe* which he occupied until 1866. In that year he became assistant to John Morley in the editorial conduct of the *Fortnightly Review*. From 1868 to 1876 he was assistant editor and principal contributor to the *Economist* under the editorship of Walter Bagehot, and served during a part of the same period as city editor of the *London Daily News*, for which he furnished a daily trade and financial article. He was appointed in 1876 chief of the statistical department of the Board of Trade. He continued to hold office after it was merged in 1882 with that of assistant secretary of the Board of Trade. As a result of another change in the organization of the department, he was, in 1892, appointed comptroller-general of the commercial, labor and statistical departments. He retired in 1897. He was a contributor on financial and economic subjects to the *Fortnightly Review*, the *Saturday Review*, and the *Spectator*. Among his published works are the following: *American Railways as Investments* (1873); *Stock Exchange Securities* (1878); *Essays in Finance* (1st series, 1879; 2d series, 1886); *Progress of the Working Classes in the Last Half-Century* (1884); *The Growth of Capital* (1890); *The Case against Bimetallism* (1892); *Economic Inquiries and Studies*, 2 vols. (1904).

**GIFTS AND BEQUESTS.** The list of gifts and bequests in 1910 given below is taken from the *Chicago Tribune*, which collects these data annually.

The year 1910, as 1909, was characterized by extraordinary beneficence. The gifts and bequests amounted to a total of \$141,604,538, while the total in 1909 was \$147,641,253. Of the amount for 1910 \$97,492,407 represents gifts, and \$44,112,131, bequests. To charities of various kinds was given \$56,229,243; to educational institutions, \$61,283,182; to religious institutions, \$12,654,443; to art museums, galleries and public improvements, \$9,536,680. A significant feature of the report for 1910 is the

rapidly decreasing amount given to libraries (\$1,911,000). Notable also is the increased beneficence of women.

As in previous years, the names which head the list of benefactors are those of Andrew Carnegie and John D. Rockefeller. Mr. Carnegie's gifts up to the close of 1910 are estimated at nearly \$180,000,000. Mr. Rockefeller's are estimated at \$135,000,000. Mrs. Russell Sage occupies third place in the amount of benefactions, and the total amount distributed by her since the death of Mr. Sage is about \$22,000,000. Among the most notable gifts of the year were those of Mrs. E. H. Harriman, who gave land along the Hudson to the State of New York for a State park; Isaac C. Weyman, who left \$4,000,000 to Princeton University, and those of David Ranken and Sons of St. Louis, who gave \$3,000,000 to the Ranken Trade School.

The following list includes gifts which amount in value to \$5000 and over.

- Aaron, Louis I., Pittsburg, Pa., gift to charity, \$60,000.
- Abbott Academy, gift by F. F. Raymond, \$5000.
- Abraham, Henry, New Orleans, La., gift to charity, \$7500.
- Ackerson, T. B., Brightwater, L. I., gift to town, \$250,000.
- Adams, Edward, New York, gift to Columbia College, \$30,000.
- Adams, Francis C., New York, will to charity, \$60,000.
- Adams, Mr. and Mrs. George E., Chicago, Ill., gift for small park, \$15,000.
- Agassiz, Alexander, Boston, Mass., gift to Harvard University, \$200,000; gift to American Academy of Arts and Science, \$50,000; gift to National Academy of Science, \$50,000.
- Agricultural College, Normal, Ala., gift by N. F. McCormick, Chicago, Ill., \$12,000; gift by Virginia McCormick, \$5000.
- Alassard, Henry, Nashua, N. H., gift to charity, \$43,000.
- Allegheny College, gift by J. F. Eberhart, \$25,000; Allen, M. C., Glens Falls, N. Y., will to Masonic bodies, \$45,000.
- Alstead, N. H., gift of library by Mr. and Mrs. J. G. Shedd, \$150,000.
- America University, gift by Sarah M. Billings, \$5000.
- American Academy of Arts and Science, gift by Alexander Agassiz, \$50,000.
- American Bible Society, gift by various donors, \$500,000.
- American Geographical Society, N. Y., gift by D. O. Mills, \$25,000.
- American Museum of Natural History, gift by Mrs. M. K. Jesup, \$50,000.
- American Scandinavian Society, gift by Neils Poulsen, \$100,000.
- American University, gift by unnamed donor, \$50,000; gift by A. L. and Mary C. Maris, \$50,000.
- Ammon, Margaret, Bloomington, Ill., gift to charity, \$30,000.
- Andersen, Lars, Boston, Mass., gift of bridge to Cambridge, Mass., \$300,000.
- Andrew, U. J., Bath, N. Y., will to Muhlenberg College, \$6000.
- Angell, Helen B., Boston, Mass., gift to charity, \$200,000.
- Anti-Tuberculosis Institute, gift by Mrs. Keith Spalding, \$7000.
- Anti-Tuberculosis Society, gift by J. W. Bochner, \$10,000.
- Archbold, J. R., New York, gift to State Park, \$50,000.
- Archeri, Joseph, Passaic, N. J., gift to charity, \$25,000.
- Armour, J. O., Chicago, Ill., gift to Armour Institute, \$70,000.
- Armour Institute, gift by J. O. Armour, \$70,000.
- Arnot, Mathias H., Elmira, N. Y., gift to Art Gallery, \$600,000; to Yale University, \$15,000; for hospital \$30,000; to church \$30,000.
- Art Association, gift by Frederick Layton, Milwaukee, Wis., \$5000.
- Art College, New York, gift by unnamed donor, \$15,500.
- Art Institute, Chicago, Ill., gift by various donors, \$31,000.
- Art Museum, Boston, Mass., gift by Mrs. W. F. Fitz, \$17,000.
- Associated Jewish Charities, gift by various donors, \$50,000.
- Atlanta, Ga., gift for state museum by various donors, \$75,000.
- Atwood, Frank M., Chicago, Ill., gift to charity, \$50,000.
- August, Joseph, Cleveland, O., gift to Denver Jewish Hospital, \$25,000.
- Augustana College, gift of library by Kenkman family, \$175,000; gift by various donors, \$250,000; gift by Frederick Meyerhauser, \$150,000.
- Austin, Margaret, Bridgeport, Conn., gift to charity, \$50,000.
- Avery, S. P., Hartford, Conn., gift to Chicago Art Institute, \$10,000.
- Bacon Academy, gift by Julia D. Tainor, \$5000.
- Baer, George E., Reading, Pa., gift to Franklin and Marshall College, \$50,000.
- Bainbridge, Caroline H., San Francisco, Cal., gift to charity, \$12,000.
- Baker, G. F., New York, gift to State Park, \$50,000.
- Baldwin College, gift by J. A. and Anna Motter, \$30,000.
- Bamberger, Max, Philadelphia, Pa., gift to charity, \$500,000.
- Banbach, Rosa, Sandusky, O., gift to charity, \$50,000.
- Barbour, Edmund B., Boston, Mass., gift to Massachusetts College, \$500,000.
- Barker, Francis, Everett, Kan., gift to library, \$6000.
- Barnard College, gift by Mary E. Brinckerhoff, \$50,000; gift by various donors, \$7000.
- Barney, Newton, Farmington, Conn., gift to Yale University, \$20,000.
- Bartlett, A. C., Chicago, Ill., gift to Old People's Home, \$50,000.
- Bean, Mary S., Norristown, Pa., gift to charity, \$10,000.
- Beebe, Lydia A., Wellesley, Mass., gift to church, \$94,500; gift to education, \$8000.
- Beggs, Robert H., Denver, Colo., gift to Denver University, \$20,000.
- Belleville, N. J., Library, gift by Andrew Carnegie, \$20,000.
- Bellingham Chautauqua Association, gift by Genevieve C. Phipps, \$50,000.
- Beloit College, gift by Francis E. Curtiss, \$25,000.
- Bemis, George, Spencer, Mass., gift to church,

\$16,000; gift to charity, \$65,000; gift to library, \$15,000.

Benson, Susan E., Reading, Pa., gift to education, \$5000; gift to church, \$48,000; gift to charity, \$25,000.

Benton, Edward, Greenfield, Mass., gift to town, \$8000.

Berea College, gift by W. S. Hubbell, \$50,000.

Berlin-American Institute, gift by James Speyer, New York, \$100,000; gift by Arthur Reppel, \$100,000.

Berlin University, gift for library by Jacob Schiff, \$25,000.

Berwind, John E., New York, gift to Manassas School for Colored Youth, \$15,000.

Bible Society, gift by Helen Gould, \$25,000.

Bigelow, John, New York, gift of library to Malden, N. Y., \$50,000.

Bigelow, L. F., family, New York, gift to church, \$10,000.

Billings, Sarah M., Wellboro, Pa., gift to America University, \$5000.

Billmeyer, Susanne, Philadelphia, Pa., gift to charity, \$5000.

Bixby, W. K., St. Louis, Mo., gift to hospital at Adrian, Mich., \$25,000.

Blue Ridge Association, gift by John D. Rockefeller, \$50,000.

Bochner, J. W., Evansville, Ind., gift to Anti-Tuberculosis Society, \$10,000.

Bogue, S. W., New York, gift to Dickinson College, \$50,000.

Bonney, J. T., Norfolk, Va., gift for Home for Girls, \$200,000; will to charity, \$400,000.

Bonsall, Ellwood, Philadelphia, Pa., gift to church, \$54,400.

Bookwalter, J. W., Springfield, O., gift to charity, \$7000.

Booth, R. A., Salem, Ore., gift to Willamette University, \$100,000.

Boston, Mass., gift for children's hospital by F. W. Hunnewell, \$150,000; gift for children's hospital by various donors, \$79,000.

Boston University, gift by unnamed donor, \$100,000.

Botsford, C. M., Boston, Mass., will to Idaho Industrial Institute, \$10,000; will to Fargo College, \$10,000; will to W. C. T. U., \$10,000.

Boys' Club, gift by Mrs E. H. Harriman, \$113,000.

Brayton, Mrs. H. A., Fall River, Mass., gift to Y. M. C. A., \$5000.

Brightwater, L. I., gift to town by T. B. Ackerson, \$250,000.

Brinckerhoff, Mary E., New York, gift to Metropolitan Museum, \$10,000; gift to charity, \$39,000; gift to Barnard College, \$50,000.

Brittan, Amelia C., Pottstown, Pa., gift to charity, \$25,000.

Bronx Botanical Gardens, N. Y., gift by D. O. Mills, \$50,000.

Bross estate, gift of library to Winnetka, Ill., \$30,000.

Brown, Harriett A., Boston, Mass., will to church, \$15,000.

Brown, Hattie Q., Xenia, O., gift to Wilberforce College, \$13,000.

Brown, Julius L., Atlanta, Ga., gift to Georgia School of Technology, \$100,000.

Browne, James, Philadelphia, Pa., gift to charity, \$12,500.

Bryant, Nathaniel A., Adrian, Mich., gift to Y. M. C. A., \$10,000.

Buchtel College, gift by unnamed donor, \$30,000.

Budapest Academy of Sciences, gift by Gladys Vanderbilt Szechenyi, \$125,000.

Burdette, Mrs. R. J., Pasadena, Cal., gift to Throop Polytechnic Institute, \$5000.

Burton, J. H., May's Landing, N. J., gift to church, \$10,000.

Burton, W. H., Mobile, Ala., gift to church, \$25,000.

Busch, Adolphus, St. Louis, Mo., gift to German Museum, Harvard University, \$100,000.

Bush, John C., Mobile, Ala., gift to Howard College, \$10,000; gift to Judson Institute, \$10,000; gift to church, \$40,000; gift to charity, \$10,000.

Butler, Mrs. H. B., Chicago, Ill., gift to charity, \$50,000.

Butler, J. A., Buffalo, N. Y., will to charity, \$18,000; will to church, \$7000.

Butler, James G., St. Louis, Mo., gift to Y. W. C. A., \$50,000.

Buttrick, Martha M., Lowell, Mass., gift to charity, \$12,300.

Byers, Annie H., Pittsburg, Pa., gift to charity, \$100,000.

Cambridge, Mass., gift of bridge by Lars Andersen, Boston, Mass., \$300,000.

Campbell, Mary A., Philadelphia, Pa., will to charity, \$5000.

Canisius College, gift by various donors, \$101,040.

Capen, Elizabeth F., Oldham, Mass., gift to hospital, \$12,000.

Carbago Earthquake Fund, gift by various donors, Boston, Mass., \$25,000.

Carhart, Hamilton, Detroit, Mich., gift to National Railroad Men's Home, \$100,000.
